⁷⁵ The principal author of the NTP study, Kristina Thayer, testified at her deposition that she is no longer comfortable with the assumption of a 1-to-1 equivalence between fluoride exposures in animals and humans; Thayer testified that she would approach the issue differently today, with greater attention to interspecies differences in toxicokinetics and toxicodynamics. (Thayer Deposition at 151:9-152:3, 302:21-303:23). These issues are discussed further below.

⁷⁶ Holman et al. (2015).

⁷⁷ Zorrilla (1997), p. 144; Lazic and Essioux (2013), p. 3.

to detect effects, including the absence of chronic studies and the absence of studies investigating neonatal exposures that are comparable to formula-feeding exposures in human infants, as discussed further below.

77. Although the NTP expressed concern about the difficulty of distinguishing fluoride's effects on learning/memory from its effects on the motor/sensory system, each of these effects is neurotoxic and a matter of concern.

5. Developmental Studies Published Since the NTP Review

78. Subsequent to the NTP's review, 11 additional developmental studies have reported learning and memory outcomes.⁷⁸ Ten of these studies found deficits in the fluoride-treated groups. Notably, the Bartos et al. studies, which controlled for litter effects, found impairments in learning and memory at a fluoride concentration of just 5 mg/L. I will discuss these studies further in the Quantitative Dose Response section below.

6. McPherson (2018) and Other "No Effect" Studies

79. McPherson et al. (2018) is the one developmental study published since the NTP review that did not find clear adverse effects on learning and memory, although it did find a significant increase in pain sensitivity (a neurotoxic effect).

80. There are several features of the McPherson study that may help to explain the absence of a clear effect on learning and memory. First, unlike the overwhelming majority of previous studies on fluoride neurotoxicity, the McPherson study used Long Evans Hooded rats, which some have suggested may have lower sensitivity to fluoride than other strains.⁷⁹ To date,

⁷⁸ Bartos et al. (2018; 2019); Chen et al. (2018a); Cui et al. (2017); Ge et al. (2018); McPherson et al. (2018); Sun et al. (2018); Wang et al. (2018a); Zhao et al. (2019); Zhu et al. (2017); Zhou et al. (2019).

⁷⁹ Elliott (1967).

three studies⁸⁰ have examined the effect of fluoride on learning in Long Evans rats, and all three have failed to find an effect.⁸¹

81. Second, in contrast to most of the other developmental studies, McPherson et al. did not start the exposure until the 6th day of gestation.⁸² As pregnancy in rats lasts approximately 21 days, any effects due to exposures early in, or preceding, the pregnancy may not have been detected by McPherson's study design.

82. Third, the offspring in the McPherson study had virtually no fluoride exposure during the neonatal period because the rat pups were breastfed during the pre-weaning period. This is important because the fluoride content of breast milk in rats (as with other mammals, including humans) is negligible, even when the mother is consuming large quantities of fluoride.⁸³ The rats in the McPherson study thus missed a potentially key period of vulnerability (early infancy)—an important limitation given the widespread use of infant formula among human neonates.⁸⁴

83. In addition to the McPherson study, three other studies (with weaker study designs) reported no neurotoxic effects from fluoride exposure.⁸⁵ These three studies include Whitford et al. and Pulungan et al. which started with adult animals, and an unusual study by Jia et al. which started at gestational day 9. All or part of the gestational period was thus missed in each of these studies.

⁸⁰ Elliott (1967); Varner et al. (1994); McPherson et al. (2018).

⁸¹ The plausibility of strain-specific differences between Long Evans and other rats is supported by other research which has found that Long Evans Hooded rats have different sensitivities to teratogenic substances in utero than Sprague-Dawley rats (Kang et al. 1986).

⁸² McPherson et al. (2018).

⁸³ Fluoride concentrations in mammalian milk are very low in comparison to the mother's fluoride intake, even when the mother's fluoride intake is quite high (NRC 2006, pp. 33, 36; Drinkard et al. 1985).

⁸⁴ This limitation is not unique to the McPherson study, as all other developmental studies on fluoride have failed to supplement the pup's exposure during the breastfeeding stage.

⁸⁵ Whitford et al. (2009); Pulungan et al. (2018); Jia et al. (2019).

84. According to the *Guidelines*, “To judge that an agent is unlikely to pose a hazard for neurotoxicity, the minimum evidence would include data from a host of endpoints that revealed no neurotoxic effects.”⁸⁶ This evidence does not exist for fluoride. To the contrary, almost all studies, including McPherson et al. (2018), have reported adverse effects on at least one of the endpoints measured.

D. Other Considerations

1. Dose Response

85. The *Guidelines* recognize that “determining a hazard often depends on whether a dose-response relationship is present,”⁸⁷ and thus “dose-response evaluation is a critical part of the qualitative characterization of a chemical’s potential to produce neurotoxicity.”⁸⁸ Because “human studies covering a range of exposures are rarely available,” the *Guidelines* state that the dose-response evaluation will typically be limited to animal data.⁸⁹

86. In contrast to the chemicals that EPA has evaluated under the *Guidelines*, there is abundant dose-response data for fluoride from *human* studies. Most importantly, the ELEMENT and MIREC birth cohort studies have found linear dose-response relationships between maternal urinary fluoride and IQ in the offspring.⁹⁰ The linearity of the dose-response relationships in these studies was not simply assumed—it was scrutinized through several methods, which I understand Drs. Hu and Lanphear will be explaining as part of their testimony.

87. Dose-response trends have also been observed in cross-sectional studies as a function of childhood urine and serum fluoride levels, although these are inherently less certain.⁹¹

⁸⁶ EPA (1998a), pp. 55-56.

⁸⁷ EPA (1998a), p. 2.

⁸⁸ EPA (1998a), p. 50.

⁸⁹ EPA (1998a), p. 50.

⁹⁰ Bashash et al. (2017; 2018); Green et al. (2019).

⁹¹ Cui et al. (2018); Ding et al. (2011); Xiang et al. (2011); Zhang et al. (2015b).

An important limitation with dose-response data from cross-sectional studies is that the exposures are tested after the effect (reduction in IQ) has occurred. The data, however, are not without value, as current exposures can be reflective of developmental exposures in areas with stable populations and stable water fluoride concentrations. In the Zhang study, for example, most of the children had been living in the same household and drinking from the same wells since birth.⁹²

88. In addition to dose-response data from human studies, there is also considerable dose-response data from animal studies. A prerequisite for dose-response analysis in animal studies is that there be multiple treatment groups with different exposures to the test substance. Many of the animal studies on fluoride have used multiple treatment doses, and thereby permit evaluation of dose response. Of the studies published since the NRC review (summarized in Table A-1), 1 used four treatment doses, 17 used three treatment doses, and 16 used two treatment doses (in addition to the control groups). Of these 34 studies, 30 show visually apparent dose-response trends for at least one of the effects being investigated.

2. Neuroendocrine Effects

89. EPA's *Guidelines* recognize the relevance of a chemical's ability to alter the function of the thyroid gland.⁹³ According to the *Guidelines*, "the development of the nervous system is intimately associated with the presence of circulating hormones such as thyroid hormone."⁹⁴ A thyroid disturbance during a specific developmental period may cause a "nervous system deficit, which could include cognitive dysfunction, altered neurological development, or visual deficits, [depending] on the severity of the thyroid disturbance and the specific developmental period when exposure to the chemical occurred."⁹⁵ Elsewhere, EPA has recognized

⁹² Zhang et al. (2015b), p. 4.

⁹³ EPA (1998a), p. 50.

⁹⁴ EPA (1998a), p. 50.

⁹⁵ EPA (1998a), p. 50.

that “thyroid hormones are essential for normal brain development in humans and that hypothyroidism during fetal and early neonatal life may have profound adverse effects on the developing brain.”⁹⁶

90. Thyroid toxicity may be a significant mechanism by which fluoride affects neurodevelopment. In 2006, the NRC had enough information to conclude that fluoride is an “endocrine disrupter” which may lower thyroid function.⁹⁷ Sodium fluoride was once prescribed as a therapeutic agent for *lowering* thyroid activity in cases of *hyperthyroidism*.⁹⁸ The NRC reported that fluoride can lower thyroid function at estimated average intakes of 0.05-0.13 mg/kg/day in humans with adequate iodine intake, and at estimated average intakes as low as 0.01 to 0.03 mg/kg/day in individuals with iodine deficiency.⁹⁹ Put differently, fluoride affects thyroid function at lower doses in people with iodine deficiency than in those with optimal intake of iodine.

91. Epidemiological research published subsequent to the NRC’s report is consistent with and further supports NRC’s findings. In 2018, Malin et al. reported a relationship between urinary fluoride and elevated TSH (thyroid stimulating hormone) among iodine-deficient adults in Canada, but not in the general population as a whole (excluding those with known thyroid disease and excluding pregnant individuals).¹⁰⁰ Elevated TSH is indicative of a decrease in thyroid function. Ten percent of women of child-bearing age in the US are iodine deficient.¹⁰¹

⁹⁶ EPA (2008a), p. 40, citing Morreale de Escobar et al. (2000) and Haddow et al (1999). See also EPA (2008b), p. 54, citing Morreale de Escobar et al. (2000). EPA’s Science Advisory Board in 2013 found that “the most sensitive life stages are the fetus, neonates and infants because these are the stages when thyroid-dependent brain development occurs” (EPA 2013b, cover letter, p. 2).

⁹⁷ NRC (2006), pp. 262-263.

⁹⁸ Galletti and Joyet (1958). Consistent with this thyroid use (i.e., lowering thyroid function), fluoride exposure has been associated with hypothyroidism in animal and human studies (Hillman et al. 1979; Peckham et al. 2015; Yang et al. 2019).

⁹⁹ NRC (2006), pp. 262-263.

¹⁰⁰ Malin et al. (2018). Barberio et al. (2017) found no association between fluoride exposure and thyroid status, but the iodine-deficient part of the population was not specifically addressed.

92. In 2015, a nationwide study from England reported a significant association between water fluoridation and increased prevalence of hypothyroidism.¹⁰²

3. Toxicokinetics

93. Under the *Guidelines*, consideration should be given to the toxicokinetics of the chemical with “particular importance” given to the chemical’s capacity to get through the blood-brain barrier.¹⁰³ The permeability of the blood brain barrier is particularly important when a chemical, such as fluoride, is able to make it through the placenta. Studies in humans have repeatedly demonstrated that fluoride crosses the placenta and reaches the fetus,¹⁰⁴ and thus it is generally accepted that “fluoride readily crosses the placenta.”¹⁰⁵ In general, measured concentrations of fluoride in umbilical cord blood and in blood of neonates are similar to concentrations in maternal blood.¹⁰⁶ In short, the fluoride that a mother ingests will cause exposure to the fetus.

94. Fluoride is also known to cross the blood-brain barrier,¹⁰⁷ and passage of fluoride into the brain can be expected to be higher during the fetal and neonatal life stages when the blood brain barrier is not yet fully developed.¹⁰⁸ As the EPA has recognized, “Because the blood-brain barrier limits the passage of substances from blood to brain, in its absence, toxic agents can freely enter the developing brain.”¹⁰⁹ Consistent with EPA’s observation, the recent rat study by

McPherson et al. found sharply elevated concentrations of fluoride in the brain following prenatal exposure.¹¹⁰

4. Mode of Action

95. EPA's *Guidelines* recognize that hazard identification is strengthened by, but not dependent upon, an identifiable mechanism by which the chemical can exert neurotoxic effects.¹¹¹ For most of the chemicals for which EPA has established RfDs pursuant to the *Guidelines*, the mode of action has not been known (see Table 1). As noted recently by the NAS, "solid conclusions about causality can be drawn without mechanistic information, for example, when there is strong and consistent evidence from animal or epidemiology studies."¹¹² The NAS added that "mechanistic frameworks today could probably be completed for only a few chemicals."¹¹³

96. Several plausible mechanisms—both indirect and direct—have been identified that could help explain the neurotoxicity of fluoride.

97. *Indirect Mechanisms:* Depression of thyroid function is likely a principal indirect mechanism and could account for some of the neurotoxic effects reported in the literature. A thyroid mechanism is particularly plausible as a cause of IQ loss among offspring born to women with suboptimal iodine intakes.

98. *Direct Mechanisms* A recent study by Zhao et al. provides *in vitro*, *in vivo*, and epidemiological data that, together, suggest that disturbances in hippocampal mitochondrial dynamics (marked by fission inhibition and fusion promotion) play an important role in fluoride-induced cognitive loss.¹¹⁴ The hippocampus is an important region in the brain for learning and

¹¹⁴ Zhao et al. 2019.

memory, and many of the studies investigating the neuroanatomical and neurochemical effects of fluoride exposure have identified adverse effects in this region (see Table A-1). Other potential modes of action have also been identified, including signaling disruption, oxidative stress, and selective reductions in nicotinic receptors.¹¹⁵

5. In Vitro Studies

99. EPA's *Guidelines* also call for consideration of *in vitro* data. While positive *in vitro* data are not sufficient, by themselves, to demonstrate a neurotoxic hazard in humans, the existence of such data helps enhance the reliability of *in vivo* data.¹¹⁶

100. Fluoride's ability to damage brain cells has been documented in *in vitro* experiments. While most of the *in vitro* studies have used high concentrations that are unlikely to be present in the human brain, several studies have examined environmentally realistic fluoride concentrations. Gao et al. found increased lipid peroxidation and reduced $\alpha 7$ nicotinic acetylcholine receptors in brain cells at fluoride concentrations (i.e., 9.5 parts per billion) that are commonly found in the blood of people living in fluoridated areas.¹¹⁷ Increases in markers of neuroinflammation have also been found at low concentrations.¹¹⁸ Under the *Guidelines*, these data do not demonstrate a hazard in humans, but they do enhance the reliability of the animal studies, as similar effects have been reported in fluoride-treated rodents.¹¹⁹

6. Validity of the Database

101. Under the *Guidelines*, the validity of the database should be evaluated by assessing

¹¹⁵ Bartos et al. (2018); Chen et al. (2003; 2018a); Gao et al. (2008); Liu et al. (2010); Long et al. (2002); Shan et al. (2004); Zhang (2017b); Zhu et al. (2017).

¹¹⁹ Bartos et al. (2018); Dong et al. (2015); Yang et al. (2018a); Yan et al. (2016); Zhao et al. (2019).

the content validity, construct validity, concurrent validity, and predictive validity of the data.¹²⁰

102. *Content validity* addresses “whether the effects result from exposure.”¹²¹ This factor weighs decisively in favor of a neurotoxicity hazard determination for fluoride. The NRC concluded that fluoride interferes with the brain,¹²² and the evidence has gotten stronger since. Kristina Thayer, the Director of EPA’s IRIS Division, has explained that “experimental animal studies are designed to let you draw causal inferences,” and that the animal studies show that fluoride damages the brain at some level of exposure.¹²³ Further, while the human cross-sectional studies are limited in their ability to produce causal inferences, the *Guidelines* provide that prospective cohort studies permit “direct estimates of risk attributable to a particular exposure.”¹²⁴

103. *Construct validity* addresses whether the neurologic effects that have been observed “are adverse or toxicologically significant.”¹²⁵ This factor is satisfied in the fluoride database. Animal studies have linked fluoride to learning and memory deficits, which are an adverse effect upon which EPA has established reference doses for other neurotoxicants (e.g., BDE-153).¹²⁶ Further, the human epidemiological data have linked fluoride with IQ detriments, including an approximate 5 to 6 point drop in IQ as maternal urinary fluoride increased from 0 to 1 mg/L.¹²⁷ EPA has recognized that a loss of a single IQ point is associated with a loss in lifetime earnings,¹²⁸ and EPA’s Clean Air Science Advisory Council has stated that “a population loss of 1-2 IQ points

¹²⁸ EPA (2008e), p. 5-28.

is highly significant from a public health perspective” and should be prevented in 99.5% of the population.¹²⁹

104. *Concurrent Validity* addresses “whether there are correlative measures among behavioral, physiological, neurochemical, and morphological endpoints.¹³⁰ Studies have correlated fluoride’s cognitive effects in animals with various neurochemical and neuroanatomical changes,¹³¹ and a few studies have correlated fluoride-associated cognitive loss in humans with increased TSH and alterations in mitochondrial dynamics.¹³² For example, Zhao et al.¹³³ reported lower circulating levels of a mitochondrial protein (fission-related protein-1, Fis1) in children from high fluoride areas (compared with children in low fluoride areas), and higher circulating levels of a second mitochondrial protein (mitofusin-2, Mfn2) in the same children. The levels of circulating Fis1 were positively associated with children's IQ scores, while the levels of circulating Mfn2 were negatively associated with the IQ scores. In addition, several plausible mechanisms of fluoride neurotoxicity have been described (discussed above).

105. *Predictive validity* addresses “whether the effects are predictive of what will happen under various conditions.”¹³⁴ The condition of perhaps greatest interest with respect to prediction of fluoride neurotoxicity is exposure during the prenatal period. Studies in both animals and humans have, with one exception,¹³⁵ reported neurologic effects following prenatal exposure. The database, therefore, does have some degree of predictive validity, although further research remains necessary to determine to what extent other conditions (e.g., nutrition, genetics, neonatal

¹³⁴ EPA (1998a), pp. 10-11.

¹³⁵ McPherson et al. (2018).

exposure, and kidney function) may modify or predict outcomes. Exposure during the early postnatal period also requires further research.

7. Data Gaps

106. EPA's *Guidelines* point to the need to address "significant data gaps."¹³⁶ One of the major data gaps for fluoride is the lack of research on the impact of fluoride during the neonatal and early infancy period. EPA has recognized that the neonatal period represents a critical window of vulnerability to neurotoxicants,¹³⁷ yet most developmental rodent studies do not address neonatal exposures to fluoride (due to exclusive breastfeeding of the rat or mouse pups and absence of gavage exposures). Other data gaps include the absence of long-term animal studies, and the scarcity of epidemiological research into fluoride's neurologic effects in the elderly. Data gaps also remain with respect to how the dose which causes neurologic effects varies across susceptible subsets of the population, including those with nutrient deficiencies, genetic polymorphisms, kidney disease, and the elderly.

E. Conclusion: There Is Sufficient Evidence that Neurotoxicity Is a Hazard of Fluoride

107. The large and substantial body of evidence that now exists for fluoride, from both animal and human studies, satisfies EPA's "sufficient evidence" standard for hazard determination.

108. The *Guidelines* provide that "the minimum evidence sufficient would be data on a single adverse endpoint from a well-conducted study."¹³⁸ The *Guidelines* also recognize that prospective cohort studies are the optimal type of epidemiological study that permit direct

¹³⁶ EPA (1998a), p. 12.

¹³⁷ See for example, EPA (2008a), p. 42.

¹³⁸ EPA (1998a), p. 55.

estimates of risk. The minimum evidence threshold is thus met for fluoride because there is not just one, but *four* high-quality prospective cohort studies that support the endpoint of IQ loss, and another high-quality prospective cohort study that supports the endpoint of inattention.¹³⁹

109. EPA's *Guidelines* also permit consideration of the collective evidence when no study, by itself, is sufficient to permit a hazard determination. This, again, supports a hazard determination for fluoride because the prospective studies are most compelling when viewed in the context of (i) the toxicokinetic data showing that fluoride crosses the placenta and enters the fetal brain; (ii) animal data showing neurochemical and neuroanatomical damage following fluoride exposure; (iii) animal data finding impairments in learning and memory following prenatal exposure to fluoride; (iv) cross-sectional studies consistently finding reductions in IQ in communities with elevated fluoride exposure; (v) *in vitro* studies reporting effects on brain cells at concentrations of fluoride found in the blood of individuals living in fluoridated communities; and (vi) animal and human studies finding that fluoride can depress thyroid function, a known risk factor for neurodevelopmental harm.

110. Based on the collective data—which are far more robust than the data EPA has relied upon for prior hazard determinations—I conclude with a reasonably high degree of confidence that neurotoxicity is a hazard of fluoride exposure.

VI. QUANTITATIVE DOSE RESPONSE

111. If a chemical is identified as posing a neurotoxic hazard, EPA's *Guidelines* call for a quantitative dose-response analysis to determine the reference dose (RfD). The RfD is “an estimate (with uncertainty spanning perhaps an order of magnitude) of a daily exposure to the

¹³⁹ Bashash et al. (2017; 2018); Green et al. (2019); Till et al. (2020); Valdez-Jiménez et al. (2017).

human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.”¹⁴⁰

112. In the Quantitative Dose Response analysis, human or animal data are assessed to determine an appropriate “Point of Departure” (POD). As the name implies, the Point of Departure (POD) is the datapoint from which the RfD is ultimately derived. The POD can be one of three types of values: the No Observed Adverse Effect Level (NOAEL), the Lowest Observed Adverse Effect Level (LOAEL) or the Benchmark Dose Level (BMDL). While EPA now has a preference for using BMD, it still uses both the NOAEL and LOAEL approaches in its assessments.

113. The following figure provides a visual illustration of the difference between a NOAEL and LOAEL on a dose-response curve.

A. Basis for Using Animal Data

114. When human data are available, EPA’s preference is to use human data for the Point of Departure.¹⁴¹ In the case of fluoride, the recent prospective cohort studies¹⁴² with individual-level biomonitoring data provide suitable data for this purpose. If one had to choose,

¹⁴⁰ EPA (1998a), p. 57. See also EPA (2009a).

¹⁴¹ EPA (2018a), p. 2-1.

¹⁴² Bashash et al. (2017; 2018); Valdez-Jiménez et al. (2017); Green et al. (2019).

therefore, between deriving the POD for fluoride from the human or animal data, *the choice would clearly be to use the human data*. But this does not mean that the animal data are without value. In EPA's assessment of methylmercury, for example, the EPA derived its RfD from human prospective cohort data, but it also considered what the RfD would be if it were derived from the animal literature.¹⁴³ As the EPA noted, "[i]t is informative to compare RfDs derived from animal studies with those derived from the epidemiological literature."¹⁴⁴ In the case of methylmercury, the animal-based RfD supported the human-based RfD, and EPA cited this as a factor that increased its "confidence" in the assessment.¹⁴⁵

115. In this case, Dr. Philippe Grandjean conducted a dose-response analysis of the prospective cohort data where he derived a BMDL. To avoid duplication of Dr. Grandjean's effort, and to determine whether Dr. Grandjean's BMDL is consistent with potential RfDs derived from the animal data, I focused my assessment on the animal literature.

116. In this assessment, I did not seek to select a single value for the RfD. Instead, I sought to identify the full range of RfDs that can be derived, including the *least* protective. If human exposures exceed RfDs that use non-protective assumptions, there would be greater confidence that a human risk does, in fact, exist.

117. There are several considerations that support the use of animal data to establish an RfD for fluoride. First, EPA has used animal studies as the principal studies for each of the neurotoxicity risk assessments it has thus far conducted under the *Guidelines*. Second, EPA has used impairment in learning and memory in rodents as the adverse effect upon which to base the RfD for other chemicals,¹⁴⁶ thus this is an accepted endpoint to use in deriving an RfD. Third, a

¹⁴³ EPA (2001), pp. 17-18.

¹⁴⁴ EPA (2001), pp. 17.

¹⁴⁵ EPA (2001), pp. 18-19.

¹⁴⁶ For example, BDE-153 (EPA 2008c, p. 36).

substantial number of animal studies of fluoride neurotoxicity have used 2 or 3 treatment groups (in addition to control groups), and EPA has found this to be sufficient for identifying Points of Departure,¹⁴⁷ including in animal studies with as few as 10 rats per group (2-Hexanone).¹⁴⁸

B. Selecting Points of Departure

118. In the literature review discussed earlier, 37 rodent studies were identified that have investigated fluoride's impact on learning and memory since the NRC report (Table A-2). All but 3 of these studies found adverse effects in the fluoride-treated rodents, including 16 of the 17 studies that investigated prenatal fluoride exposures. Since the prenatal period represents a point of heightened vulnerability to neurotoxicants, the prenatal studies are a logical candidate for the point of departure.

119. To avoid studies at high risk of bias, the three studies that did not specifically mention using a randomization procedure were excluded from further consideration.¹⁴⁹ Further, in order to focus the analysis on those studies best suited for identifying a Point of Departure (POD), four studies that only used one treatment dose were excluded.¹⁵⁰

120. Table 2 and the figures below summarize the 10 prenatal studies that remained for POD consideration. Most of the studies used a similar dosing regimen with 2 or 3 treatment groups and at least 10 rodents per group, which is consistent with several of the principal studies that EPA has used to establish an RfD. The figures show the lowest-observed and no-observed effect levels in each study and help to visually compare the data across studies.

121. Nine of the 10 studies found dose response trends for one or more effects, which

¹⁴⁷ EPA (2000b; 2008a; 2008c; 2008d; 2009b).

¹⁴⁸ EPA (2009b).

¹⁴⁹ Bera et al. (2007); Basha et al. (2011b); Ge et al. (2018).

¹⁵⁰ Niu et al. (2014); Banala and Karnati (2015); Dong et al. (2015); Zhu et al. (2017).

adds confidence to a causative role of the fluoride treatment.¹⁵¹ Six of these studies also provide data on the body weights of the pups, and no bodyweight changes were seen in any of the studies at the lowest concentrations producing the effects.¹⁵² Only one of the six studies found any bodyweight changes among pups in the higher-dose groups.¹⁵³ Of the two studies that reported maternal weight, neither found any changes.¹⁵⁴

122. One limitation with these studies is that only three of them specifically mention controlling for litter effects,¹⁵⁵ which introduces some uncertainty since the failure to control for litter effects can result in false positives, as well as false negatives.¹⁵⁶ While a source of uncertainty, the failure to control for litter effects does not preclude use for risk assessment purposes. As noted earlier, EPA has used studies that do not control for litter effects as the principal studies upon which it has based RfDs for developmental neurotoxicity.¹⁵⁷

¹⁵¹ See for example, Jiang et al. (2014b), Table 3; Cui et al. (2017), Table 3; Chen et al. (2018a), Figure 1d,e; Sun et al. (2018), Tables 2 and 3; Wang et al. (2018a), Figure 4b,c; Zhao et al. (2019), Figure 5e.

¹⁵² Bartos (2018; 2019); Cui et al. (2017); Jiang et al. (2014b); Wang et al. (2018a). The study by McPherson (2018) also showed no changes in bodyweight, although it did not find effects on learning/memory.

¹⁵³ Jiang (2014b) found reduced body weight gain among the pups in the 23 mg/L and 45 mg/L groups.

Jiang et al. (2014b)	Rats, Sprague- Dawley	Prenatal ^b + 2 months	11, 23, 45	12	11	None	11	None

^a Treatment groups in addition to the control group.^b Exposure of the mother began before pregnancy.^c Animals were given 0, 10, or 20 mg/L fluoride in drinking water, plus 3.24 ppm fluoride in feed. An additional control group had 0 mg/L fluoride in drinking water plus 20.5 ppm fluoride in feed (McPherson et al. 2018).

123. Based on the dose-response data from these studies, the following values could be used as the Point of Departure.

124. **LOAEL of 5 mg/L:** The lowest observed adverse effect levels in the studies were fluoride concentrations of 4.5 and 5 mg/L. Of the six studies that used this concentration, three

found adverse effects on learning,¹⁵⁸ and two of the other three studies, which did not find effects on learning, *did find alterations in the brain*.¹⁵⁹ Two of the three studies reporting effects on learning at 5 mg/L controlled for litter effects, which suggests that the failure to control for litter effects is unlikely to explain the reported effects at this concentration.¹⁶⁰ A 5 mg/L LOAEL was selected, therefore, as one of the Points of Departure (PODs) for learning impairment from prenatal fluoride exposure.

125. **LOAEL of 23 mg/L**: Seven of the 10 studies used 23 mg/L as one of the treatment doses, and all 7 of these studies found impaired performance on the cognitive tests, with 6 of the 7 studies finding changes in the brain as well. 23 mg/L appears, therefore, to be a reliable “Observed Adverse Effect Level,” particularly in light of the six studies (discussed above) which found adverse effects at < 5 mg/L. Although not the *lowest* observed effect level, it is assumed to be one for purposes of this Point of Departure.

126. **LOAEL of 45 mg/L**: As can be seen in the above figures, 45 mg/L is clearly an “observed adverse effect level,” just as it has been in many other animal studies on fluoride neurotoxicity. It would be difficult to justify selecting 45 mg/L as the LOAEL because it is the *highest* observed adverse effect level in this group of studies, not the *lowest*. Nevertheless, for purposes of capturing the broadest possible range of RfDs that can be derived from the animal literature, a 45 mg/L LOAEL was selected as one of the Points of Departure.

¹⁵⁸ Cui et al. (2017); Bartos et al. (2018; 2019). In the Chen study (which had only six rats per group), there is some indication of an effect on learning in the 4.5 mg/L group, albeit not statistically significant (Chen et al. 2018a, Figure 1).

¹⁵⁹ Chen et al. (2018a); Zhao et al. (2019). Other studies have also found alterations in the brain at ≤ 5 mg/L, including Liu et al. (2010; 2011); Zhang et al. (2015a); Niu et al. (2018a); Varner et al. (1998); and Yu et al. (2019).

¹⁶⁰ Bartos et al. (2018; 2019).

127. **NOAEL of 11 mg/L:** Four of the prenatal studies used 10 or 11 mg/L for the low-dose group.¹⁶¹ The two studies of mice failed to find a significant effect on learning at this level,¹⁶² and, as such, 11 mg/L could be selected as a NOAEL. The fact that the two studies that did not find effects at 11 mg/L found them at higher concentrations (23 and 45 mg/L) would be a factor weighing in favor of this choice, as the animal models were sensitive enough to find an effect. It bears considering, however, that the two studies finding no effects on learning at 11 mg/L did find alterations in the brain at this level,¹⁶³ which is consistent with 11 mg/L being a LOAEL, rather than a NOAEL. However, for purposes of reflecting the spectrum of RfDs that can be derived from the animal literature, 11 mg/L was treated as a NOAEL for one of the PODs.

128. **NOAEL of 20 mg/L:** The highest possible NOAEL that can be selected from these prenatal studies is the 20 mg/L no-effect finding from McPherson et al.¹⁶⁴ As discussed earlier, there are limitations with the McPherson study that may have made it less sensitive to detecting an effect, including strain of rat used and lack of first trimester exposure. Further, the study did find an adverse neurotoxic effect in the 20 mg/L group (i.e., increased pain sensitivity), and, as such, 20 mg/L is not a true NOAEL in the study. Nevertheless, for the purpose of illustrating the upper-bound range of RfDs that can be derived from the animal literature, a 20 mg/L NOAEL will be treated as a POD for the analysis.

C. Conversion of POD Concentrations (mg/L) to Doses (mg/kg/day)

129. Reference Doses (RfDs) are expressed in terms of dose (i.e., milligrams per kilogram of bodyweight, or mg/kg/day), not in terms of water concentration. To calculate RfDs from the Points of Departure, therefore, the unit of measurement (i.e., water fluoride concentration)

¹⁶¹ Wang et al. (2018a); Sun et al. (2018); McPherson et al. (2018); Jiang et al. (2014b).

¹⁶² Sun et al. (2018); Wang et al. (2018a).

¹⁶³ Sun et al. (2018); Wang et al. (2018a).

¹⁶⁴ McPherson et al. (2018).

needs to be converted into a dosage metric.

130. The NTP's 2016 review provides data that facilitate this analysis.¹⁶⁵ In its review, the NTP estimated the doses for dozens of rodent studies by using EPA's default water consumption rates and body weight data for the species, strain, and sex of the animals studied.¹⁶⁶ A review of NTP's data shows that the average ratio of fluoride concentration (mg/L) to intake rate or dose (mg/kg/day) is 6.8, and that this ratio is generally higher for rats (typically 6 to 10) than for mice (typically 3.8 to 5). For purposes of this analysis, the low end of this range was chosen for each species (6 for rats, 3.8 for mice). The practical effect of selecting the low-end of this range, is that the estimated doses will likely *overestimate* the actual dose, and thereby *inflate* the RfDs derived from these Points of Departure.¹⁶⁷ The net result of this non-conservative approach will be RfDs that are *less* protective of human health.

D. Selecting the Uncertainty Factors

131. Consistent with EPA's standard risk assessment procedures,¹⁶⁸ the *Guidelines* provide that "uncertainty factors" (UFs) should be applied to the point of departure (POD) to ensure that the resulting RfD is protective of health.¹⁶⁹

132. Uncertainty factors are applied to account for expected variations in susceptibility among humans (*intraspecies* variability, or UF_H), expected differences in susceptibility between animals and humans (*interspecies* variability, or UF_A), and, where applicable, differences in the

¹⁶⁵ NTP (2016), Appendix 19.

¹⁶⁶ NTP (2016), p. 118.

¹⁶⁷ For example, using this method gives an intake rate of 0.83 mg/kg/day for rats for the 5 mg/L fluoride concentration (Table 5). However, Bartos et al. (2018; 2019) give an estimate of 0.6 mg/kg/day for their rats at this fluoride concentration. Using the same approach described below with Table 5 for a LOAEL of 5 mg/L, equivalent to an intake rate of 0.6 mg/kg/day, gives an RfD of 0.0005, compared with 0.0007 in Table 5.

¹⁶⁸ EPA (2018a), pp. xvii-xxiv.

¹⁶⁹ EPA (1998a), pp. 58-59.

length of exposure between the study and human conditions (subchronic to chronic, or UF_S), research gaps in the overall database (database deficiency, UF_D), and converting from a LOAEL to a NOAEL.¹⁷⁰ These uncertainty factors are “typically multiples of 10,” although they can be reduced to factors of 3 or 1 if warranted by available information.^{171,172}

1. Intraspecies Variability (UF_H)

133. EPA recognizes that susceptibility to toxic substances is not uniform across the human population, and that due to differences in *toxicokinetics* and/or *toxicodynamics* some subsets of the population will be more vulnerable to harm than others.¹⁷³

134. *Toxicokinetics* refers to the “processes which determine the extent and duration of exposure of the target organ or site of toxicity to the active chemical species,” while *toxicodynamics* refers to the “processes involved in the translation of such exposure of the target organ or site of action into the generation of a toxic effect.”¹⁷⁴ Put more simply, toxicokinetics governs how much of the chemical gets to the target site (i.e., access), while toxicodynamics governs how much of the chemical is necessary at the target site to cause the adverse effect (i.e., sensitivity).

135. If there are no chemical-specific data on toxicokinetics and toxicodynamics, EPA uses a default UF_H of 10.¹⁷⁵ This default factor of 10 is “considered to be appropriate in the absence of convincing data to the contrary.”¹⁷⁶ Consistent with this, EPA has used a UF_H of 10 in each of

¹⁷⁰ EPA (1998a), p. 59; EPA (2018a), p. xxii; EPA (2016), pp. xix-xx.

¹⁷¹ EPA (1998a), p. 59; EPA (2018a), p. xxii; EPA (2016), p. xix.

¹⁷² As discussed by Martin et al. (2013), default uncertainty factors, while sometimes viewed as overly protective, do not represent worst-case situations and cannot be safely assumed to be adequately protective of the most exposed individuals or the most susceptible individuals, nor can they be safely assumed to be protective for effects of mixtures of chemicals.

¹⁷³ EPA (2011b), p. 14; EPA (2016), p. 2-15; EPA (2018a), p. 2-12.

¹⁷⁴ Renwick (1993), p. 276.

the nine risk assessments where it has established an RfD or RfC pursuant to the *Guidelines* (Table 3).

136. In the case of fluoride, there is evidence that affirmatively demonstrates substantial variability in how humans respond to fluoride, including differences in retention (toxicokinetics) and differences in response (toxicodynamics). These data are discussed below in the Risk Characterization. While the magnitude of this variability is difficult to quantify, the data *support* the need for an uncertainty factor as opposed to providing “convincing data” *against* one. Accordingly, pursuant to standard EPA procedure, a value of 10 for UF_H was assigned.

Table 3. Summary of RfDs or RfCs developed in compliance with EPA's Guidelines for Neurotoxicity Risk Assessment.

Chemical	LOAEL	NOAEL	Uncertainty Factors					RfD or RfC ^a	Reference
			UF _H	UF _A	UF _S	UF _D	Composite		
BDE-47	10.5 mg/kg	0.7 mg/kg	10	10	3	10	3000	0.1 µg/kg/day	EPA (2008a)
BDE-99	0.8 mg/kg	0.4 mg/kg	10	10	3	10	3000	0.1 µg/kg/day	EPA (2008b)
BDE-153	0.9 mg/kg	0.45 mg/kg	10	10	3	10	3000	0.2 µg/kg/day	EPA (2008c)
BDE-209	20.1 mg/kg	2.22 mg/kg	10	10	3	1	300	7 µg/kg/day	EPA (2008d)
Chlorine Dioxide and Chlorite	6 mg/kg/day	3 mg/kg/day	10	10	1	1	100	0.03 mg/kg/day	EPA (2000b)
2-Hexanone	143 mg/kg/day	Not observed	10	10	1	10	1000	0.005 mg/kg/day	EPA (2009b)
Methanol	1000 ppm (1310 mg/m ³)	500 ppm (655 mg/m ³)	10	3	1	3	100	20 mg/m ³	EPA (2013a)

^a Where EPA established both an RfD (mg/kg/day) and an RfC (mg/m³) for a chemical, the RfD is presented.

Table 4. Comparison of BW^{1/1} and BW^{3/4} in estimating oral exposure in humans from a 10 mg/kg exposure to rats, mice, and a dog.^a

Absolute animal intake or administered dose	Species	BW(h)/BW(a)	Scaling = BW ^{1/1}		Scaling = BW ^{3/4}	
			BW scaling factor	BW scaled human intake or oral dose (mg/kg)	BW scaling factor	BW scaled human intake or oral dose (mg/kg)
0.25 mg / 0.025 kg	Mouse	70 / 0.025 = 2800	2800 ^{1/1} = 2800	(2800 × 0.25 mg = 700 mg) 700 mg / 70 kg = 10 mg/kg	2800 ^{3/4} = 385	(385 × 0.25 mg = 96 mg) 96 mg / 70 kg = 1.4 mg/kg
2.5 mg / 0.25 kg	Rat	70 / 0.25 = 280	280 ^{1/1} = 280	(280 × 2.5 mg = 700 mg) 700 mg / 70 kg = 10 mg/kg	280 ^{3/4} = 68	(68 × 2.5 mg = 170 mg) 170 mg / 70 kg = 2.4 mg/kg
120 mg / 12 kg	Dog	70 / 12 = 5.8	5.8 ^{1/1} = 5.8	(5.8 × 120 mg = 700 mg) 700 mg / 70 kg = 10 mg/kg	5.8 ^{3/4} = 3.7	(3.7 × 120 mg = 444 mg) 444 mg / 70 kg = 6.4 mg/kg

^a Taken from Table A-1 in EPA (2011b), p. 29.

2. Interspecies Variability (UF_A)

137. EPA recognizes that susceptibility to toxic substances can differ across species. As with human-to-human variability, animal-to-human variability is also rooted in principles of toxicokinetics and toxicodynamics.

138. To adjust for differences in toxicokinetics between animals and humans, EPA has developed a hierarchical framework of approaches for ascertaining the “human equivalent dose” (HED) of doses given to animals.¹⁷⁷ EPA’s “optimal” approach for determining the HED is to use a physiologically based toxicokinetic model (PBTk).¹⁷⁸ Where a PBTk model is not available, the “intermediate” approach is to use chemical-specific information that, while falling short of a full PBTk model, provides some reliable guidance.¹⁷⁹ Where there is no reliable chemical-specific information on kinetics, EPA uses a default allometric scaling method.¹⁸⁰

139. Allometric scaling is “scaling of physiological rates or quantities to relative growth and size (mass or volume) of one animal species relative to another species.”¹⁸¹ Under EPA’s recommended method for allometric scaling (BW^{3/4} Method), the HED equates to 24% of the dose given to rats, and 14% of the dose given to mice (see Table 4 above).¹⁸²

140. The BW^{3/4} Method “predominantly addresses factors involved in estimating toxicokinetics, as well as some toxicodynamic factors.”¹⁸³ EPA thus maintains a residual default UF of 3 to allow for residual uncertainty from toxicodynamics, unless there is chemical-specific information available.¹⁸⁴

¹⁸⁴ EPA (2011b), p. 21; EPA (2016), p. 2-15; EPA (2018a), pp. 2-12, 2-13.

141. The following factors were considered to account for interspecies differences in both the toxicokinetics and toxicodynamics of fluoride.

142. *Toxicokinetic Considerations:* A full PBTK model has not yet been developed for fluoride that would allow for the calculation of HEDs from doses given to animals. As such, EPA's preferred approach for controlling for interspecies toxicokinetics is not available. By contrast, there is chemical-specific information for fluoride that could support application of EPA's intermediate approach. As discussed by the NRC, rats require higher levels of fluoride in their water to achieve the same level of fluoride in their blood.¹⁸⁵ Dunipace estimated that rats require about 5 times more fluoride in water than humans to reach the same plasma concentration of fluoride,¹⁸⁶ while Den Besten's team has reported a larger margin for mice, with a difference of about a factor of 10.¹⁸⁷ The data from Dunipace and Den Besten support a toxicokinetics adjustment of 5 for rats and 10 for mice, which are slightly *higher* than, but roughly consistent with, the adjustments under the default BW^¾ Method (4 for rats, 7 for mice). The chemical-specific information for fluoride thus supports the general validity of the BW^¾ Method, but would be more protective. The BW^¾ Method, which is roughly consistent with the chemical-specific information, but slightly *less* protective, was selected as the method for the toxicokinetics adjustment.

¹⁸⁵ NRC (2006), pp. 98-99; pp. 442-446, Appendix D; NRC (2009), pp. 88-89.

¹⁸⁶ NRC (2006), pp. 98, 442.

¹⁸⁷ Zhang et al. (2014).

143. *Toxicodynamic Considerations*: It has long been recognized that rodents are less susceptible (i.e., more resistant) to certain toxic effects from fluoride ingestion than are humans.¹⁸⁸ Rats, for example, have been reported to require 10 to 25 times more fluoride than humans to develop dental fluorosis.¹⁸⁹ Differences in toxicokinetics contribute to rodents being less sensitive to fluorosis, but the differences appear larger than would be expected if they were due solely to kinetics. The fluorosis data support the existence of differential toxicodynamics between rodents and humans, but it is unclear if this difference would also apply to neurotoxicity, as this has not yet been the subject of study. Conversely, there are no data to suggest that humans are *more resistant* to fluoride neurotoxicity than animals. In the absence of data, EPA's default uncertainty factor of 3 was selected to account for interspecies differences in toxicodynamic differences.

3. LOAEL to NOAEL

144. When EPA uses a LOAEL from animal data as the Point of Departure, it applies an additional uncertainty factor of 10 to convert the LOAEL into an estimated NOAEL.¹⁹⁰ Consistent with EPA practice, the three LOAEL-based PODs were adjusted by a factor of 10.

4. Composite Uncertainty Factor

145. The "composite" uncertainty factor is the product of all uncertainty factors used in an analysis. The composite uncertainty factor applied here to the NOAEL-based PODs is **30**, which is the same value that EPA has been using in its draft risk evaluations under TSCA.¹⁹¹ The

¹⁸⁸ Roholm (1937), pp. 265, 318; Lehman and Fitzhugh (1954), p. 33; Angmar-Mansson and Whitford (1982), p. 339.

¹⁸⁹ Roholm (1937), pp. 265, 318; Angmar-Mansson and Whitford (1982), p. 339.

¹⁹⁰ EPA (1998a), p. 59.

¹⁹¹ In my expert report, I also calculated alternate RfDs where I applied additional uncertainty factors that EPA uses to account for subchronic animal exposures and deficiencies in the fluoride database (e.g. no data on formula-feeding during the neonatal period). For purposes of simplicity, I have not included those calculations in this declaration.

composite uncertainty factor applied here to the LOAEL-based PODs is **300**, which is on the low-end of the range of the composite uncertainty factors that EPA has used in its neurotoxicity risk assessments (see Table 3 above).

E. RfD Calculations from Animal Data

146. Table 5 summarizes the RfD calculations for each of the five Points of Departure (POD) listed above. The RfDs range from 0.0007 to 0.006 mg/kg/day for the LOAEL-based PODs, and 0.01 to 0.03 mg/kg/day for the NOAEL-based PODs. The least protective RfD that can be derived from the literature in a manner consistent with EPA practice is thus **0.03 mg/kg/day**.

Table 5. Calculation of the RfD from the selected Points of Departure (POD), based on the studies summarized in Table 2.

A Observation	B Intake rate	C POD _{HED}	D NOAEL	E UF _H = 10	F UF _A = 3	G RfD
LOAEL or NOAEL from Table 6 mg/L	Column A / 6 (rats) or 3.8 (mice) mg/kg/day	Column B × 0.24 (rats) or 0.14 (mice) mg/kg/day	Column C / 10 (LOAEL) or 1 (NOAEL) mg/kg/day	Column D / 10 mg/kg/day	Column E / 3 mg/kg/day	Column F mg/kg/day
5 mg/L, LOAEL (rats)	0.83	0.20	0.020	0.0020	0.00067	0.0007
23 mg/L, LOAEL (rats)	3.8	0.91	0.091	0.0091	0.0030	0.003
45 mg/L, LOAEL (rats)	7.5	1.8	0.18	0.018	0.0060	0.006
11 mg/L, NOAEL (mice)	2.9	0.41	0.41	0.041	0.014	0.01
20 mg/L, NOAEL (rats)	3.3	0.79	0.79	0.079	0.026	0.03

Column A: The observed LOAEL or NOAEL from Table 2.

Column B: The observed LOAEL or NOAEL converted from mg/L to an intake rate (dose) in mg/kg/day. For rats, the LOAEL or NOAEL is divided by 6; for mice, the NOAEL is divided by 3.8 (see explanation in text).

Column C: The intake rate for rats or mice converted to a human equivalent dose (HED) using the BW^{3/4} method (see explanation in text). The HED = 24% of the intake rate for rats or 14% of the intake rate for mice.

Column D: NOAEL as already obtained (NOAEL / 1) or as estimated from a LOAEL (LOAEL / 10).

Column E: The estimated NOAEL after application of an intraspecies uncertainty factor (UF_H), where UF_H = 10. The NOAEL from Column D is divided by UF_H (i.e., NOAEL / 10).

Column F: The estimated NOAEL after application of an additional uncertainty factor for interspecies variability (UF_A), where UF_A = 10. The adjusted NOAEL from Column E is divided by UF_A (i.e., NOAEL / 3).

Column G: The value of the Reference Dose (RfD) obtained with only UF_H and UF_A. RfD = the NOAEL value in Column F, rounded to 1 significant digit.

VII. EXPOSURE ASSESSMENT

147. The only condition of use at issue in this case, as I understand it, is the addition of fluoridation chemicals to drinking water. Because of this, I limited the scope of my exposure assessment to exposures directly attributable to fluoridated water (0.7 mg/L). The purpose of my assessment was to enable a comparison of the doses people ingest from fluoridated water with the toxicity values (LOAELS and NOAELs) derived from the animal studies. I did not consider fluoride intake from dental products, pesticides, industrial pollution, occupational exposures, black tea, or other sources.

148. In my assessment, I considered fluoride exposures among both the general public as well as subsets of the population known to consume elevated amounts of water. For the source data, I relied primarily on the NRC's 2006 report which presented estimates of fluoride intake from water containing 0.7 mg/L fluoride. The NRC's estimates were based on an EPA analysis of community water intake data that were collected in a national survey by the US Department of Agriculture (USDA) in the 1990s.¹⁹² The USDA survey was "designed to obtain a statistically representative sample of the United States population," and EPA stated that data from this survey "may be used in risk assessment analyses where exposures that occur through ingestion of water are of concern."¹⁹³

149. Based on NRC's data, human exposure to fluoride from fluoridated water is estimated to range from an average of 0.011 mg/kg/day for adults to a "high" of 0.14 mg/kg/day for 95th percentile-exposed infants.

150. Following my initial report, a criticism was raised that I should have conducted a

¹⁹² The USDA survey is called the "Continuing Survey of Food Intakes by Individuals," or CSFII for short.

¹⁹³ EPA (2000a), p. 5-5.

systematic review of all water intake data published subsequent to the NRC's report. In response to this criticism, I reviewed an updated and comprehensive review of water intake data that EPA published in 2019. The review was published as an update to EPA's *Exposure Factors Handbook* ("*Handbook*"), which is a document "intended for use by exposure and risk assessors both within and outside the U.S. EPA as a reference tool and primary source of exposure factor information."¹⁹⁴

151. In its 2019 report, EPA presented the results of its "comprehensive review of the scientific literature [on water intake] through 2017" and provided EPA's determination as to "the most up-to-date and scientifically sound" data¹⁹⁵ to use for tap water consumption in the US.¹⁹⁶ The report thus provides the community water intake values¹⁹⁷ that EPA now recommends using for risk assessment for each age group in the population.¹⁹⁸

152. The water intake data that EPA identifies in its 2019 report are consistent with EPA's older water intake data that I relied upon in my initial assessment. For example, whereas I selected 0.011 mg/kg/day as an average adult exposure, the EPA's updated data produce mean intakes by adults of 0.011-0.013 mg/kg/day (i.e., the same as or slightly higher than my estimate).¹⁹⁹ Further, whereas I selected 0.14 mg/kg/day as the 95th percentile exposure among

¹⁹⁴ EPA (2011a), p. 1-3.

¹⁹⁵ EPA (2019b), p. 1-5.

¹⁹⁶ EPA selected its own analysis of water intake data from NHANES's 2005-2010 surveys as the "key study" to use for all age groups in the general population and for pregnant and lactating women. For formula-fed babies, EPA selected an analysis by Kahn of the USDA's CSFII survey, which is the same survey that the NRC relied upon for its estimates in 2006.

¹⁹⁷ EPA's report presents water intake in terms of milliliters of water consumed per kilogram of bodyweight per day (mL/kg/day). This permits a direct estimation of fluoride exposure from fluoridated water because the concentration of fluoride is known (0.7 micrograms per milliliter). By way of example, if a person drinks 100 milliliters of fluoridated water per kilogram of bodyweight, they will receive a dose of 70 micrograms of fluoride per kilogram, which is more commonly expressed as 0.07 milligrams per kilogram (i.e., 0.07 mg/kg/day).

¹⁹⁸ EPA (2019b), pp. 3-1, 3-4, 3-7, & 3-9.

¹⁹⁹ EPA (2019b), pp. 3-4.

bottle-fed infants, EPA's updated data produce 95th percentile values ranging from 0.13 mg/kg/day to 0.2 mg/kg/day (i.e., higher than my estimate).²⁰⁰

153. The similarity between the two EPA datasets can be seen in the following figure. The figure shows the fluoride exposure from water for *all* community water consumers for *all* age groups combined. The left side of the figure shows EPA's 2000 data (that NRC and I relied upon), while the right side of the figure shows EPA's 2019 data. To help put these exposures in context, the figure also shows the five reference doses from the animal neurotoxicity data (Table 5).

154. As can be seen in the figure, the two datasets show that a *substantial* percentage of the population that consume fluoridated tap water exceed each of the 5 RfDs for neurotoxicity, including the least protective RfD.

155. One limitation with EPA's water intake data (from both 2000 and 2019) is that they do not include consumption of community water that is added to commercial beverages, such as soda and juice.²⁰¹ This underestimates actual exposure to fluoridated water, since commercial

²⁰⁰ EPA (2019b), pp. 3-9.

²⁰¹ EPA (2000a), p. viii.

beverages have become a significant source of exposure to fluoridated water for many people.²⁰²

156. Another limitation with EPA's water intake data is that they are based on short-term surveys (i.e., surveys taken on two non-consecutive days), which creates a source of uncertainty when extrapolating to long-term exposures. This uncertainty is minimized, however, by the large numbers of people surveyed in the studies, and the use of non-consecutive days for the survey. While not perfect, EPA has recognized these data as the most scientifically sound data to use for risk assessment.

VIII. RISK CHARACTERIZATION

157. The risk characterization step of a risk assessment integrates the evidence of hazard, exposure, and dose-response in a clear and transparent manner, and provides a description of the risk. The *Guidelines* recognize multiple ways of describing risk, including (i) characterization of highly-exposed and/or susceptible individuals; (ii) estimation of the number of individuals exposed; (iii) comparing human exposures against the RfD; and (iv) "Margin of Exposure" analysis.²⁰³

A. Characterization of Highly Exposed and/or Highly Susceptible Populations

158. Susceptibility to a chemical may be "intrinsic" (biological, e.g., life stage) or "extrinsic" (acquired, e.g., lifestyle),²⁰⁴ although many individuals may have *both* intrinsic *and* extrinsic susceptibility.

159. EPA has recognized that life stage is an important source of intrinsic susceptibility to neurotoxicants, and has identified the prenatal, infant, and elderly stages of life as "critical periods for exposure."²⁰⁵ According to the EPA, "It is a well-established principle that there are

²⁰² E.g., Heilman et al. (1999); Kiritsy et al. (1996); Turner et al. (1998).

²⁰³ EPA (1998a), pp. 63-66.

²⁰⁴ EPA (2017).

²⁰⁵ EPA (1998a), p. 65.

critical developmental periods for the disruption of functional competence, which include both the prenatal and postnatal periods to the time of sexual maturation, and the effect of a toxicant is likely to vary depending on the time and degree of exposure.”²⁰⁶ In light of this, a “population subgroup is susceptible if exposure occurs during a period of sensitivity.”²⁰⁷

160. As described below, there are large, identifiable subsets of the population that are likely more susceptible to the neurotoxic effects of fluoride than the general population, including pregnant women and their fetuses, bottle-fed infants, the elderly, and individuals with renal impairment.

1. Pregnant Women and Their Fetuses

161. Multiple converging lines of evidence support the fetal period as a critical period of susceptibility to fluoride’s neurotoxic effects. First, it is well established that fluoride crosses the placenta and reaches the fetus.²⁰⁸ Second, due to the absence of an effective blood brain barrier,²⁰⁹ the fluoride that reaches the fetus also reaches the brain—a fact that has been confirmed by both animal and human studies.²¹⁰ Third, fluoride has the capacity to lower thyroid function, particularly among individuals with low iodine intakes, and EPA has recognized that alterations to thyroid function (e.g., reductions in thyroid hormone concentrations) during pregnancy can cause cognitive disorders and other neurological harm to the child.²¹¹ Fourth, most studies of prenatal fluoride exposures in animals have documented neuroanatomical, neurochemical, and/or cognitive problems. Fifth, all prospective cohort studies that included individual measurements of

prenatal fluoride exposure have found significant adverse associations with neurocognitive harm, including IQ loss and inattention.²¹²

162. The number of pregnant women exposed to fluoridated water each year is large. The CDC estimates that there are approximately 4 million children born in the U.S. each year, and therefore about 4 million pregnancies.²¹³ With approximately two-thirds of the U.S. population living in communities where fluoridation chemicals are added to water, about 2.5 million pregnancies can be expected to occur each year in fluoridated areas.

163. Of paramount concern are pregnant women who have an iodine deficiency. The CDC considers the average iodine status (median urinary iodine concentration) of women of childbearing age (12-19 years and 20-39 years) in the U.S. to be in the “adequate intake” range, but the 10th percentiles by ethnicity and for the total population are in the “insufficient intake” range, indicating that more than 10% of women of childbearing age in the U.S. are deficient in iodine.²¹⁴ Caldwell et al. report that 35% of pregnant women and 38% of nonpregnant women in the U.S. have urinary iodine concentrations below the level considered adequate.²¹⁵ In addition, the CDC notes that even higher intakes of iodine are required for pregnant and lactating women; thus an even greater percentage of American women are likely to be deficient in iodine with respect to the demands of pregnancy and lactation.²¹⁶ Pearce suggests that iodine deficiency in the U.S. may be becoming more prevalent, especially among pregnant women.²¹⁷

164. While the effects of fluoride exposure among pregnant women with iodine

²¹⁷ Pearce (2015).

deficiency have not yet been specifically studied, there is a clear basis for concern. The NRC reported that high fluoride intake appears to exacerbate the effects of low iodine intake on thyroid function in both animals and humans.²¹⁸ Consistent with this, Malin et al. found that an increase in urinary fluoride was associated with an increase in thyroid stimulating hormone (TSH)—an indicator of decreased thyroid function—among iodine-deficient adults in Canada.²¹⁹ A decrease in thyroid function during pregnancy, even in the absence of clinical symptoms in the mother, is associated with reduced IQ and other neurological effects in the offspring.²²⁰

2. Bottle-Fed Infants

165. A bottle-fed infant has a combination of *both* intrinsic *and* extrinsic susceptibility to fluoridated water.

166. *Intrinsic Susceptibility:* The blood brain barrier does not finish developing until 6 months of age,²²¹ and, as such, the fluoride ingested during early infancy will likely reach the brain more readily than during the later childhood and adult years. The brain is also undergoing “rapid development” during infancy, with the growth rate of the brain peaking at 4 months of age.²²² The EPA has thus described the neonatal stage of life as “a critical window of development.”²²³

167. *Extrinsic Susceptibility:* Infants have the highest intake of fluid per unit body weight of any age group among humans, given their mostly liquid diet at that age. This can be seen in the following figure, which uses EPA’s 2000 water intake data to compare the community water

²¹⁸ NRC (2006), pp. 227, 234, 262.

²¹⁹ Malin et al. (2018).

²²⁰ For example, see Haddow et al. (1999); Pop et al. (1999; 2003); Morreale de Escobar et al. (2000; 2004); Klein et al. (2001); Vermiglio et al. (2004); LaFranci et al. (2005); Kooistra et al. (2006); Roman (2007); Zoeller and Rovet (2004); Patel et al. (2011); Suárez-Rodríguez et al. (2012); Modesto et al. (2015); Moleti et al. (2016).

intake of adults (on the left) with the community water intake of bottle-fed infants (on the right).

Intakes based on EPA 2000 Water Intake Estimates in US, p. IV-3.

168. According to the CDC, 75% of infants born in 2015 were formula-fed at least partially during their first six months, including 17% of infants who were *exclusively* formula-fed.²²⁴ Data vary by ethnicity, with Hispanics, whites and Asians having breastfeeding rates similar to or greater than the national averages and African Americans having substantially lower rates. Breastfeeding rates tend to be highest for higher family income and maternal education levels.

169. Breastfeeding rates in the U.S. have increased substantially in recent years from a low point in the early 1970s.²²⁵ While increased breastfeeding rates are to be encouraged for a number of reasons, it is important to remember that for many infants in the U.S., breastfeeding is not an option; these include cases of infant adoption or fostering, as well as cases of death or illness of the mother.

²²⁴ CDC (2018; n.d.).

²²⁵ DHEW (1979), pp. 2-6, especially Tables A and B.

170. Most commercial infant formula, historically and currently, has been in powder form, for which the cost is approximately half that of ready-to-feed formula, per unit volume of formula as fed.²²⁶ Based on national data collected during 2005-2007, the CDC reported that approximately 83-93% of babies are fed formula prepared from powder from cans.²²⁷ For approximately 70-78% of infants in the same national survey, formula is reconstituted with tap water at least some of the time.²²⁸

171. Based on the available information, it can reasonably be assumed that the majority of formula-fed infants in the U.S. are fed powdered formula reconstituted with water, often or usually tap water. Especially for low-income homes (where breastfeeding is less likely), it is reasonable to assume that many or most infants are fed formula prepared from powder using tap water, which in much of the country is fluoridated. In addition, for approximately 20% of infants, tap water is boiled before it is used to prepare formula;²²⁹ if this tap water is fluoridated, the resulting fluoride concentration in the formula will be higher than if the water had not been boiled.²³⁰

172. Fomon et al. estimated that infants consuming powdered formula prepared with fluoridated water (1 mg/L) will ingest between 0.116 and 0.164 mg/kg/day.²³¹ If Fomon's estimate is adjusted to account for the lower concentration of fluoride now added to water (0.7 mg/L), the result is a daily intake of 0.08 to 0.115 mg/kg/day, which is 80 to 115 times higher than the amount that Fomon et al. estimated for breast-fed infants (0.001 mg/kg/day).²³² By Fomon's estimates,

²²⁶ O'Connor (2009).

²²⁹ CDC (2017), Table 3.98.

²³⁰ For example, see Juárez-López et al. (2011).

²³¹ Fomon et al. (2000), Table 2.

²³² Fomon et al. (2000), Table 2.

essentially all formula-fed infants will exceed the RfDs for neurotoxicity if their formula is prepared with fluoridated tap water.

173. Fomon's estimates agree well with recent data from Harriehausen et al., who surveyed 114 parents in Houston to determine brand and type of formula, total volume of formula consumed over 24 hours, and infant weight.²³³ Most of the parents in the study (corresponding to 92.1% of the infants) reported using powdered formula, which is consistent with the literature described above.²³⁴ Harriehausen et al. estimated that over 50% of infants fed formula made with fluoridated water will exceed 0.1 mg/kg/day during the first 4 months of life (Table 6).

Table 6. Estimated fluoride ingestion from infant formula, assuming fluoridated water at 0.7 mg/L.^a

Category	Age				
	2 months	4 months	6 months	9 months	12 months
Number of infants	32	23	27	21	11
Predicted fluoride intake					
Mean (mg/kg/day)	0.110	0.112	0.090	0.066	0.053
Variance	0.0033	0.0016	0.0018	0.0012	0.0009
Standard deviation ^b	0.057	0.040	0.042	0.035	0.03
Distribution of fluoride intake					
> 0.1 mg/kg/day (%)	59.4	56.5	33.3	14.3	9.1
< 0.1 mg/kg/day (%)	40.6	43.5	66.7	85.7	90.9

^a Data from Harriehausen et al. (2019), Table 3.

^b Calculated from the variance reported by Harriehausen et al. (2019), Table 3.

²³³ Harriehausen et al. (2019).

²³⁴ Harriehausen et al. (2019), Table 2.

174. The estimates from both Harriehausen and Fomon are consistent with EPA's most up-to-date and scientifically sound estimates for formula-fed infants.²³⁵ According to EPA's updated estimates, mean fluoride exposures during the first 6 months of life for infants receiving formula reconstituted with fluoridated water are **0.07 to 0.10 mg/kg/day** (age-dependent), with 95th percentile exposures of **0.13 to 0.2 mg/kg/day** for the first 3 months and **0.13 mg/kg/day** for the next three months.²³⁶ These intakes are very high, and far exceed even the least protective RfD, as shown in the following figure.

175. In its *Guidelines*, EPA considers the potential for postnatal toxicant exposures to interact with breastmilk composition.²³⁷ EPA was referring to animal studies, but the principle would apply to humans as well: Replacement of the mother's milk with a substitute that contains a toxic agent would be an extremely important source of postnatal exposure for infants and children

²³⁵ EPA (2019b), p. 3-9.

²³⁶ EPA (2019b), p. 3-9.

²³⁷ EPA (1998a), p. 46.

to that toxic agent. Few, if any, animal studies reproduce the effect of formula-feeding of human infants, in terms of a water-based formula containing fluoride being substituted for the mother's milk; thus this very important developmental period is routinely missed in most developmental studies on fluoride.

176. Consistent with the high fluoride intakes produced by formula feeding, studies have found that bottle-fed babies have higher rates of dental fluorosis (a disorder of enamel caused by excess fluoride intake) in their permanent teeth.²³⁸ Studies have also documented an increased prevalence and severity of dental fluorosis in the African American community, which is consistent with the high rate of formula feeding in this population.²³⁹

177. While fluoride exposure during infancy is known to produce abnormal physiological changes in the body (e.g., dental fluorosis), there has been a paucity of research on the neurodevelopmental effects of this exposure. In the developmental studies on fluoride neurotoxicity to date, the pups have been *breastfed*. Consequently, the existing animal data do not reflect the neurotoxic effects that may occur during the neonatal period.

178. Studies in humans have found lower IQ scores among formula-fed babies versus breastfed babies,²⁴⁰ but up until this year,²⁴¹ no study had investigated the role that fluoridated water may have in this association. Specific differences in brain activation and regional volumes of gray matter have been reported among formula-fed children, indicating developmental changes in children in comparison with breastfed children.²⁴² Such effects (and other adverse effects of

²³⁸ Hong et al. (2006a; 2006b); Forsman (1977); Walton and Messer (1981); Fomon and Ekstrand (1999); Fomon et al. (2000).

²³⁹ EPA (2010), pp. 33-34; Exhibit 34 to Casey Hannan Deposition; CDC (2005), Table 23.

²⁴⁰ For example, see Fomon (2001); Wolf 2003; Belfort et al. (2013); Horta et al. (2015; 2018); Victora et al. (2015; 2016); Kanazawa (2015); Boutwell et al. (2018). Many studies have controlled for possible confounders such as maternal IQ, maternal education, and family income.

²⁴¹ Till et al. (2020).

²⁴² Ou et al. (2016).

formula-feeding compared with breastfeeding, especially compared with exclusive breastfeeding for at least the first several months) could, in principle, be due to loss of the enhanced mother-child bonding associated with breast-feeding,²⁴³ to deficiency of an essential nutrient (e.g., long-chain saturated fatty acids) in the formula,²⁴⁴ to the presence of a toxic contaminant in the water used to prepare the infant formula,²⁴⁵ or to some combination of these factors.

179. Given the *a priori* basis for concern that fluoridated water may adversely affect the neurological system of bottle-fed infants, the recent findings from Till et al. must be taken very seriously.²⁴⁶ Using a prospective cohort study design, Till et al. found that fluoridated water consumption during infancy is associated with a large and significant reduction in non-verbal IQ at age 4 (i.e., a loss of 9.3 non-verbal IQ points for each 0.5 mg/L increase in exposure). Although the study did not find a statistically significant association with Full-Scale IQ after excluding several outliers, this could be a result of imprecision in the exposure estimates, or might reflect differential impacts of pre- and post-natal exposure.

180. As noted earlier, CDC data indicate that 17% of babies are *exclusively* fed formula for their first six months of life (i.e., never breast-fed).²⁴⁷ Assuming 2.5 million live births per year in fluoridated areas, approximately 1.9 million infants living in fluoridated areas will be formula-fed for at least part of the time during their first six months, including 425,000 infants who are *exclusively* formula-fed.²⁴⁸ Approximately 70-78% of these infants will have their formula made

²⁴⁸ CDC (2018; n.d.).

with fluoridated tap water (some of which will be boiled and have higher concentrations), at least part of the time.²⁴⁹

3. Elderly

181. The elderly have also been identified by the EPA as an at-risk group for neurotoxicity.²⁵⁰ According to the EPA, the elderly are “at particular risk because of the limited ability of the nervous system to regenerate or compensate to neurotoxic insult.”²⁵¹

182. The NRC has described the possible relationship of fluoride exposure, especially exposure to aluminum fluoride complexes, to the development of Alzheimer’s disease.²⁵² The NRC based its concern, in part, on studies reporting pathological lesions in the brain of fluoride-treated rodents that parallel the changes in humans with dementia.²⁵³ A recent study by Cao et al. found that exposure to fluoride for 3 months among mice genetically prone to degenerative brain changes, produced more severe, and earlier development of, neuropathological lesions than in controls, including lesions associated with Alzheimer’s.²⁵⁴ Goschorska et al. have recently postulated that fluoride plays a likely role in the initiation and progression of Alzheimer’s disease, based largely on the neuroanatomical and neurochemical changes seen in the brains of fluoride-treated animals.²⁵⁵

183. While epidemiological data on fluoride and cognition in the elderly remain relatively sparse, Li et al. reported a very high rate of cognitive impairment (81.1%) in an endemic fluorosis area.²⁵⁶ Li did not find a linear relationship between urinary fluoride and the severity of

²⁴⁹ CDC (2017), Table 3.97; Juárez-López et al. (2011).

²⁵⁰ EPA (1998a), p. 65; see also NRC (2006), p. 351.

²⁵⁴ Cao et al. (2019).

²⁵⁵ Goschorska et al. (2018).

²⁵⁶ Li et al. (2016), p. 59.

cognitive impairment within the endemic fluorosis area; however urinary fluoride levels among those with any form of cognitive impairment were significantly higher than those with normal cognition.²⁵⁷ Russ et al. described a longitudinal study involving nearly all people born in Scotland in 1921, who were passively followed for diagnoses of dementia after 2004.²⁵⁸ Residential locations after age 60 (or at death or at time of diagnosis of dementia) were used to estimate exposure to aluminum and fluoride (separately) in drinking water. The authors found that even relatively low levels of aluminum and fluoride were associated with an increased prevalence of dementia and suggested further research.²⁵⁹

184. While more research is needed to clarify fluoride's effects in the elderly population, there are a multitude of factors which support an increased vulnerability to fluoride's neurological effects among the elderly. Studies have found that water fluoridation significantly increases the level of fluoride in bone, and these levels increase with age.²⁶⁰ In the post-menopausal and elderly years, the fluoride that is taken into bone can be released back into the blood stream as bones begin to break down, leading to increased levels of fluoride in the blood.²⁶¹ Compounding this, renal function declines with age, and because of this the elderly kidney can be expected to be less efficient in clearing fluoride from the bloodstream. The net result is that more fluoride will be circulating in the bloodstream, and due to age-related increases in the permeability of the blood-brain barrier, will reach the brain more readily.²⁶²

185. Although the impact of fluoride on the elderly brain has not received as much

²⁵⁷ Li et al. (2016), Figure 2, Table 3.

²⁵⁸ Russ et al. (2019).

²⁵⁹ Russ et al. (2019).

²⁶⁰ Alhava et al. (1980); Arnala et al. (1985); Eble et al. (1992); Chachra et al. (2010).

²⁶¹ Itai et al. (2010).

²⁶² Increased permeability of the blood-brain barrier is associated with ordinary aging, as well as with diseases such as Alzheimer's and Parkinson's, both of which are common among elderly people. For example, see Mooradian (1994); Zeevi et al. (2010); Rosenberg (2014); and Pan and Nicolazzo (2018).

scholarly attention as the impact on the developing brain, this population is likely at higher risk of toxicity than healthy adults, particularly among those with elevated accumulation of fluoride in the bone following long-term residence in a fluoridated area.

Renal Impairment

186. It is well recognized that people with renal impairment (kidney disease) are less able to excrete fluoride, resulting in higher concentrations of fluoride in the body and greater susceptibility to adverse health effects from fluoride exposure.²⁶³ The World Health Organization states that it “is known that persons suffering from certain forms of renal impairment have a lower margin of safety for the effects of fluoride than the average person.”²⁶⁴ In addition, a number of papers report an association between renal impairment and reduced IQ or other cognitive impairment,²⁶⁵ which is consistent with higher fluoride retention (and often higher water intake and consequent higher fluoride intake). The role of fluoride in these IQ deficits has not yet been the subject of epidemiological study.

4. Other Predisposing Factors

187. There are a number of other factors that are known, or reasonably anticipated, to increase susceptibility to the chronic toxic effects of fluoride exposure, including neurotoxicity. These factors include:

188. *Diseases that Increase Water Intake*: The NRC identified population subgroups whose water intake “is likely to be substantially above the national average for the corresponding sex and age group” as susceptible subpopulations with respect to fluoride exposure.²⁶⁶ Health

²⁶³ For example, see Marumo and Iwanami (2001); NRC (2006), pp. 30, 292, 351; Ibarra-Santana (2007); Schiff (2008).

²⁶⁴ WHO (2004), p. 6.

²⁶⁵ For example, see Madero et al. (2008); Mendley et al. (2015); Chen et al. (2018b).

²⁶⁶ NRC (2006), p. 30.

conditions that affect water intake include “diabetes mellitus, especially if untreated or poorly controlled; disorders of water and sodium metabolism, such as diabetes insipidus; [and] renal problems resulting in reduced clearance of fluoride.”²⁶⁷ According to the NRC, adults with diabetes mellitus can ingest 0.05 mg/kg/day from fluoridated water alone, while children with diabetes mellitus can have fluoride intakes as high as 0.07 mg/kg/day.²⁶⁸ For children and adults with nephrogenic diabetes insipidus, NRC estimated waterborne fluoride intakes of 0.11 mg/kg/day.^{269,270} Each of these intakes exceeds the least protective RfD.

189. *Nutrient Deficiencies:* Nutritional deficiencies can contribute to increased susceptibility to fluoride toxicity.²⁷¹ Calcium deficiency and iodine deficiency are expected to be particularly important in terms of vulnerability to neurotoxic effects of fluoride, but deficiencies of magnesium, vitamin C, protein, and other nutrients have also been associated with increased susceptibility to the effects of fluoride exposure.

190. *Genetic Susceptibilities:* A number of studies have shown associations between specific genetic arrangements and a greater susceptibility to the chronic effects of fluoride exposure,²⁷² including dental fluorosis and alterations to reproductive hormones.²⁷³ While a complete picture of the relationship between genes, gene regulation, and adverse effects of fluoride exposure remains to be developed, it is already quite clear that some people or groups of people

²⁶⁷ NRC (2006), p. 30.

²⁶⁸ NRC (2006), p. 35, Table 2-4.

²⁶⁹ NRC (2006), p. 35, Table 2-4.

²⁷⁰ Consistent with this, case reports have documented moderate to severe dental fluorosis among children with diabetes insipidus who drank water with 0.5 to 1 mg/L NRC (2006), p. 33.

(2016); Zhang et al. (2013b); Pei et al. (2017); Jiang et al. (2015); Zhang et al. (2015b); Cui et al. (2018); K  chler et al. (2018); Bhagavatula Naga (2009).

²⁷³ Zhao et al. (2015); Zhou et al. (2016); Ma et al. (2017); An et al. (2019).

are inherently more vulnerable than others to adverse effects of fluoride exposure and require a greater level of protection from fluoride exposures.²⁷⁴ The implications to neurotoxicity have not yet been extensively studied, but two recent studies from China, including one with extensive control for covariates, suggest that certain genotypes may significantly magnify fluoride's impact on IQ in some individuals.²⁷⁵ A third, smaller study reported a contrary result.²⁷⁶ More research is needed to clarify this issue, but in light of the broader literature on genetic susceptibility to chronic fluoride toxicity, it is reasonable to suspect that genetics plays a role in rendering some individuals more vulnerable to fluoride's neurological effects.

B. Margin of Exposure (MOE)

1. Introduction to the MOE Approach and Its Similarity to the RfD Approach

191. Under the *Guidelines*, neurotoxic risk can be described either through a comparison of the human exposures to the RfD, or by calculating the “Margin of Exposure” (MOE).²⁷⁷ Although the two approaches use slightly different frameworks, they produce the same results. If comparison of human exposure with the RfD shows a risk, a risk will be shown by MOE as well, and vice versa.

192. RfD and MOE analyses produce the same results because they use the same Point of Departure (i.e., NOAEL, LOAEL, or BMDL) for the toxicity value, the same data for human exposure, and the same composite uncertainty factor to assess whether human exposure poses a risk. Where the two methods differ is in how they put these three pieces together and the terminology they use, as will now be discussed.

193. In an RfD analysis, human exposure is compared against the Reference Dose. As

²⁷⁴ Wu et al. (2015); Yang et al. (2016); Pei et al. (2017); Li et al. (2017); Yang et al. (2018b).

²⁷⁵ Cui et al. (2018); Zhang et al. (2015b).

²⁷⁶ Pang et al. (2018).

²⁷⁷ EPA (1998a), pp. 65-66; Federal Register (1998), pp. 26949-26950.

discussed earlier, the Reference Dose is the Point of Departure (i.e., NOAEL, LOAEL, or BMDL) divided by the composite uncertainty factor. In an MOE analysis, by contrast, human exposure is *compared directly against the Point of Departure*. If the ratio (i.e., Actual MOE) between the Point of Departure and human exposure is less than the composite uncertainty factor (i.e., Acceptable MOE), an unacceptable risk is presumed to exist.^{278,279} In short, the composite uncertainty factor is the standard for judging whether human exposure is unacceptably close to the toxicity value under both frameworks.

2. MOE Analysis

194. As part of the risk assessment, I conducted an MOE analysis to characterize risk because this is EPA's preferred method to characterize non-cancer risk under TSCA, as evident by its risk evaluations under both Section 5 (new chemicals)²⁸⁰ and Section 6 (existing chemicals).²⁸¹

195. *Points of Departure*: The same five Points of Departure (converted into Human Equivalent Doses) that were used for the derivation of the Reference Doses, as discussed above (see Table 5), were used for the MOE analysis.

196. *Acceptable MOEs (Benchmark MOEs)*: The same composite uncertainty factors that were used for the RfD derivation were selected as the Acceptable MOEs: 30 for the NOAEL-based PODs, and 300 for the LOAEL-based PODs. In EPA's draft risk evaluations under Section 6 of TSCA, EPA has used composite uncertainty factors of 30 for NOAEL-based PODs, and has

²⁷⁸ EPA (2016), p. 61; EPA (2012), p. 13-8.

²⁷⁹ EPA sometimes refers to the risk as a "risk of concern." EPA (2007), p. 13; EPA (2000c), p. C-12.

²⁸⁰ See for example EPA (2018b; 2018c; 2018d; 2018e; 2018f; 2018g; 2019a).

²⁸¹ In its draft risk evaluations under Section 6 thus far, EPA has used MOE to characterize non-cancer risk. (EPA 2019c; 2019d; 2020). In its Final Rule for Risk Evaluation under Section 6, however, EPA described the MOE method as "just one of several approaches to risk characterization" that may be used under TSCA (Federal Register 2017, p. 33735).

characterized this as a relatively small uncertainty factor that “indicates greater certainty in the data (because fewer of the default UFs relevant to a given POD . . . were applied).”²⁸² EPA has contrasted this with a composite uncertainty factor of 1,000, which “would indicate more uncertainty in risk estimation and extrapolation.”²⁸³

197. *Human Exposure:* At the time I conducted this analysis, EPA had not yet released any of its Section 6 draft risk evaluations. I relied, therefore, on EPA’s risk evaluations under Section 5 for guidance on the human exposure assessment. In the Section 5 risk evaluations, EPA considers the highest-exposed group in the population. When dealing with chemicals that may be present in drinking water, therefore, EPA’s MOE analyses separately consider the exposures of *infants*.²⁸⁴

198. Based on the guidance from the Section 5 risk evaluations, I relied on the NRC’s 2006 data to calculate a range of exposures representing the general adult population along with highly exposed population subgroups, including bottle-fed infants and individuals with high water intakes (for example, due to medical conditions or to physical exertion).²⁸⁵

199. In EPA’s draft risk evaluations under Section 6, EPA has used the 95th percentile exposure to represent highly exposed individuals.²⁸⁶ This is the same percentile exposure I used

²⁸² EPA (2019d), p. 301.

²⁸³ EPA (2019d), p. 301.

²⁸⁴ See for example EPA (2018b; 2018c; 2018d; 2018e; 2018f; 2018g; 2019a).

²⁸⁵ For the general adult population, I combined NRC’s estimates for adult consumers of municipal water, ages 20-24 and 25-54 years (0.011 mg/kg/day). As an example of elderly adults (ages 65+), I included the 90th percentile of adult consumers of municipal water (0.022 mg/kg/day). To account for individuals with high water intakes, I used the NRC’s waterborne fluoride intake estimates (at 0.7 mg/L) for adult athletes and physical laborers (0.05 mg/kg/day), children with diabetes mellitus (0.07 mg/kg/day), and individuals with nephrogenic diabetes insipidus (0.1 mg/kg/day). For bottle-fed infants, I estimated a typical (0.1 mg/kg/day) and high (0.14 mg/kg/day) exposure based on the data from Fomon et al. (2000), Harriehausen et al. (2019), and NRC (2006). None of these exposure estimates, even those labeled “high,” is an upper bound or maximum exposure.

²⁸⁶ E.g., EPA (2019d), pp. 266, 300; EPA (2020), p. 108.

for high exposures among bottle-fed infants, and a higher percentile exposure than I used for the elderly (90th percentile).

200. Table 7 and the two figures below show the results of the MOE analyses. The first figure shows the results using the three LOAEL-Based PODs, while the second figure shows the results using the NOAEL-based PODs. As can be seen, the Actual MOEs are below the Acceptable MOEs for each group using every POD (including the least protective), with the exception of *average* adults and 90th percentile elderly when using the NOAEL-based PODs. If EPA's recommended 95th percentile exposure data (0.031 mg/kg/day) is used as the exposure for adults, risks are present even when using the least protective PODs.

201. The margins between the neurotoxicity levels in animals and the exposure levels in humans are far smaller than what EPA considers "acceptable." In fact, the Actual MOEs are so small that unacceptable risks would still be indicated for infants for each POD if the doses from animal studies had no adjustment to convert to the Human Equivalent Doses (HEDs) (i.e., no allometric scaling). Under EPA's framework for characterizing risk, therefore, it is apparent that fluoridation chemicals in drinking water present an unacceptable risk of neurotoxicity.²⁸⁷

²⁸⁷ EPA (2016), p. 61.

Table 7. Calculated Margins of Exposure (MOEs)^a for selected subgroups of the human population for the NOAELs and LOAELs for fluoride in Table 5.

Observation ^b	Intake rate ^c	Human Equivalent Dose (HED) ^d	Estimated human exposures ^e					
LOAEL or NOAEL	LOAEL or NOAEL	LOAEL or NOAEL	Adults (average)	Elderly adults (90th percentile)	Athletes and laborers (high)	DM patients (high)	Bottle-fed infants (typical) NDI patients (high)	Bottle-fed infants (high)
mg/L	mg/kg/day	mg/kg/day	0.011 mg/kg/day	0.022 mg/kg/day	0.05 mg/kg/day	0.07 mg/kg/day	0.1 mg/kg/day	0.14 mg/kg/day
5 mg/L, LOAEL (rats)	0.83	0.20	18	9.1	4.0	2.9	2.0	1.4
23 mg/L, LOAEL (rats)	3.8	0.91	83	41	18	13	9.1	6.5
45 mg/L, LOAEL (rats)	7.5	1.8	163	82	36	26	18	13
11 mg/L, NOAEL (mice)	2.9	0.41	37	19	8.2	5.9	4.1	2.9
20 mg/L, NOAEL (rats)	3.3	0.79	72	36	16	11	7.9	5.6

^a A Margin of Exposure (MOE) is equal to the LOAEL or NOAEL (mg/kg/day) divided by an estimated human exposure (mg/kg/day). Usually, the benchmark MOE = 1000 for assessments based on a LOAEL and 100 for assessments based on an NOAEL. Since allometric scaling between animals and humans has been used to obtain the Human Equivalent Dose, the benchmark MOE is 300 for LOAELs and 30 for NOAELs. An MOE less than the benchmark MOE indicates an “unacceptable risk.”

^b These LOAEL and NOAEL values (mg/L) for fluoride are summarized in Table 2.

^c The intake rates (mg/kg/day) in this column correspond to the LOAELs and NOAELs in the first column (mg/L), converted to intake rates (mg/kg/day) as summarized in Table 5. For rats, the intake rate equals the LOAEL or NOAEL divided by 6. For mice, the intake rate equals the NOAEL divided by 3.8.

^d The Human Equivalent Dose (HED) is calculated from the intake rate for rats or mice as summarized in Table 5. The HED = the intake rate for rats × 0.24 or the intake rate for mice × 0.14.

^e The estimated human exposures are for fluoride exposures from drinking water alone, assuming a fluoride concentration of 0.7 mg/L in the drinking water. Sources are as follows:

Adults (average), NRC (2006), p. 430, Table B-11, average consumers ages 20-54;

Elderly adults (90th percentile), NRC (2006), p. 431, Table B-12, 90th percentile consumers ages 65+;

Athletes and laborers (high), NRC (2006), p. 35, Table 2-4, high consumers (but not upper bound);

DM patients (high), NRC (2006), p. 35, Table 2-4, patients with diabetes mellitus, high consumers (but not upper bound);

Bottle-fed infants (typical), based on Fomon et al. (2000) and Harriehausen et al. (2019);

NDI patients (high), NRC (2006), p. 35, Table 2-4, patients with nephrogenic diabetes insipidus, high consumers (but not upper bound); and

Bottle-fed infants (high), NRC (2006), p. 432, Table B-13, infants < 0.5 years old, 95th percentile consumers (but not upper bound).

C. Assumptions and Key Sources of Uncertainty

202. Uncertainties are inherent to the field of risk assessment; they are to be expected. As discussed throughout my expert report, there are uncertainties involved in a risk assessment of fluoride neurotoxicity,²⁸⁸ including:

203. *Uncertainties in the Animal Data:* The Points of Departure for both the RfDs and MOEs are derived from developmental animal studies that, while published in the peer-reviewed biomedical literature, have methodological limitations, including lack of control for litter effects, lack of blinding, lack of exposure during the full window of vulnerability (in utero *and* infancy), lack of long-term chronic exposures, and failure to rule out a contributing role of motor and sensory effects in the observed learning/memory deficits. As discussed earlier, the net effect of these limitations is uncertain. On one hand, lack of blinding can inflate the effect size, while on the other hand, lack of exposure during the full window of vulnerability and lack of chronic exposures can deflate it. Similarly, while lack of control for litter effects can create false positives, it can also create false negatives as well.²⁸⁹ Further, to the extent that fluoride is causing the learning/memory deficits indirectly through a motor/sensory mechanism,²⁹⁰ this would still be a neurotoxic effect and is thus not a basis to forego risk assessment, particularly since body weight changes do not appear to be a mediating mechanism in the studies from which the Points of Departure have been derived.

²⁸⁸ For purposes of brevity, my initial expert report did not reiterate each of these uncertainties in the risk characterization section, although I considered them as part of my assessment.

²⁸⁹ Zorrilla (1997), p. 144; Lazic and Essioux (2013), p. 3.

²⁹⁰ NTP (2016), p. vii.

204. While there are some uncertainties in the animal data (which is not unusual²⁹¹), there is reasonable confidence that the observed effects are both real and relevant. First, the animal studies have been overwhelmingly consistent—across numerous laboratories and study designs—in finding adverse effects on the brain, both structural and functional, which supports the conclusion that the effects are not an artifact of a methodological limitation. Second, the effect of fluoride on cognition has been detected in studies that have specifically controlled for litter effects and body weight changes, thus suggesting that fluoride’s effect on the brain is independent of these concerns.²⁹² Third, there are extensive human epidemiological data reporting associations between fluoride and reduced IQ, and the existence of these data adds plausibility to the animal data, and vice versa. Fourth, the finding of unacceptable risk through an MOE analysis of the animal toxicity values is consistent with Dr. Grandjean’s BMD analysis of the human data, which shows that the level of exposure associated with reduced IQ in humans is well below the levels of exposure produced by fluoridation. The confluence of the animal and human data thus adds strong overall confidence to the assessment.

205. *Uncertainties in the Extrapolation to Humans:* As discussed above, the extrapolation of animal data to humans involves some inherent uncertainty. There does not yet exist a physiologically based toxicokinetic model (PBTK) for fluoride, which would be the optimal method for adjusting for toxicokinetics.²⁹³ This uncertainty has been accounted for by EPA’s use of allometric scaling method which accounts for the expected difference in

²⁹¹ As discussed earlier, the principal animal studies that EPA has relied upon for its neurotoxicity risk assessments have also had methodological limitations, including failure to control for litter effects. There was also significant uncertainty in the animal data that EPA used for its unreasonable risk determinations for its draft NMP evaluation (e.g., there were only 6 studies available for the endpoint of concern, and three found no effect).

²⁹² Bartos (2018; 2019).

²⁹³ EPA (2011b), p. 19.

toxicokinetics), and use of an uncertainty factor of 3 (to address the expected difference in toxicodynamics). The use of default allometric scaling for fluoride is consistent with chemical-specific research on fluoride showing that rats and mice require approximately 5 to 10 times more fluoride, respectively, to obtain the same concentration of fluoride in the blood.²⁹⁴ The allometric scaling thus has a chemical-specific justification for fluoride, which provides confidence to the assessment. But, importantly, even if *no* allometric scaling is done to assess the risk of infant exposures, the MOEs still indicate unacceptable risks for *all* PODs.

206. The use of non-protective (i.e., non-conservative) assumptions provides additional confidence to the assessment. These non-protective assumptions include: (1) the use of 45 mg/L as a LOAEL, despite the fact that studies have found adverse effects well below this concentration; (2) the use of 20 mg/L as a NOAEL in McPherson (2018), despite the fact that the study found a neurotoxic effect at this concentration (i.e., increased pain sensitivity); and (3) conversion of water fluoride concentrations (mg/L) into doses (mg/kg/day) using the lowest end of the reported ratio, which results in Points of Departure that are likely higher than the actual dosages the animals received.

207. *Uncertainties in the Exposure Assessment:* As discussed above, I obtained most of my initial exposure estimates from the NRC's 2006 report, which in turn were based on EPA's own water intake data from 2000,²⁹⁵ and have also reviewed EPA's 2019 report in which the Agency identified the "most up-to-date and scientifically sound" water intake data to use for risk assessment. Both of EPA's water intake reports (from 2000 and 2019) are based on short-term (2-day) surveys, which introduces some uncertainty when extrapolating to long-term exposures.

²⁹⁴ NRC (2006), pp. 98, 442; Zhang et al. (2014).

²⁹⁵ NRC (2006), Appendix B; EPA (2000a).

Long-term surveys, however, do not exist, and the uncertainty of using 2-day surveys is minimized by the large, nationally-representative scale of the survey data. EPA has stated that it has medium-to-high confidence in the reliability of these data, and that the data are well suited for risk assessment of water-based exposures.²⁹⁶

208. *Uncertainties in the Human Data:* One of the major strengths of the database on fluoride neurotoxicity is that there is a large body of human data, including five prospective cohort studies that have individual measurements of exposure during the fetal and neonatal period. The large extent of human data for fluoride far surpasses what EPA has used for its draft risk assessments of other chemicals under Section 6,²⁹⁷ where the Agency has often had to rely *solely* on animal data.

209. The emergence of prospective cohort data on early life exposures to “optimal” levels of fluoride (from salt and water fluoridation programs)²⁹⁸ addresses the two primary criticisms that have been made with respect to the cross-sectional studies of populations with elevated levels of fluoride in water: i.e., (1) that cross-sectional studies are limited in establishing causation because the exposures are measured after the effect (i.e., IQ loss) has occurred; and (2) the cross-sectional studies involve exposures that are generally higher than what people receive through artificially fluoridated water. The fact that the prospective cohort studies have found cognitive deficits at “optimal” levels of exposure that are consistent with the effects observed in the cross-sectional studies adds *substantial* confidence to the risk characterization.

210. While the human data are very robust, data gaps do remain, particularly with

²⁹⁶ EPA (2000a), p. 5-5; EPA (2019b), pp. 3-6 & 3-10.

²⁹⁷ As discussed earlier, the data available for fluoride are also substantially more robust than the data EPA has considered in making hazard determinations for other neurotoxicants.

²⁹⁸ I understand that Dr. Hu and Dr. Lanphear will be addressing the criticisms with respect to imprecise exposure estimates, and thus I do not address that issue here.

respect to how the causative doses may vary across the population based on life-stage (e.g., the elderly), and other intrinsic sources of susceptibility, such as renal impairment, nutritional deficiencies, and genetic predisposition. These data gaps make it difficult to quantify the extent to which susceptibility varies across the population; the available data on chronic fluoride toxicity, however, provide a high level of confidence that human susceptibility to fluoride varies by a considerable margin, particularly in a population as large and diverse as the United States. Of particular concern are individuals with co-existing susceptibilities, such as pregnant women with iodine deficiencies, neonates that are bottle-fed with fluoridated water, and elderly individuals with diabetes.

211. To account for the *known* (but not yet quantified) variability in human susceptibility, I utilized EPA's default uncertainty factor of 10. This is consistent with EPA's standard practice, including EPA's Section 6 risk evaluations under TSCA. While I derived the Points of Departure from studies on susceptible (i.e., prenatally exposed) animals, the studies did not account for the full range of expected susceptibility in the human population. The studies did not, for example, attempt to replicate the formula-feeding practices of human infants, as all rodents were breast-fed during the critical neonatal period. Nor did the studies attempt to examine the effect of a co-existing iodine deficiency in the mother, or any other factor (e.g., renal impairment, calcium deficiency, etc) that would be expected to exacerbate the effects of prenatal fluoride exposure. Since hundreds of millions of Americans are now exposed to fluoridation chemicals on a regular basis, the spectrum of susceptibility will likely exceed the susceptibility examined in the available animal studies. An uncertainty factor of 10 is thus appropriate and necessary.

IX. RISK DETERMINATION

212. Under TSCA, a risk evaluation has a fifth and final step that is not included within the *Guidelines*: the Risk Determination. In the Risk Determination, EPA assesses whether the risks identified by the Margin of Exposure (MOE) analysis are “unreasonable.” In making this determination, EPA considers “relevant risk-related factors,” including (i) the effects of the chemical substance under the conditions of use; (ii) number of people exposed; (iii) whether susceptible subpopulations are exposed; (iv) the severity of the hazard; and (v) uncertainties in the data.

213. In practice, EPA’s Risk Determination analyses do not address each of the “relevant risk factors” identified above. Severity of the hazard, for example, is rarely discussed. Assessments of uncertainties in EPA’s Risk Determinations has also been rather cursory. In the NMP risk evaluation, for instance, the discussion of uncertainties in the analysis was largely limited to the assumptions involved in estimating worker exposure to chemicals in the absence of actual monitoring data.²⁹⁹ Although EPA’s risk estimates were based on an endpoint for which there were only 6 animal studies (with only 3 showing an effect), EPA did not re-address the underlying uncertainties in these data. The Risk Determination should thus not be mistaken as an exhaustive re-examination of all issues previously addressed; instead they tend to be brief and written in summary form.

214. At the time I conducted my initial assessment in this case, EPA had not yet released any risk evaluations under Section 6. For guidance, therefore, I relied on the risk characterization

²⁹⁹ EPA (2019d), pp. 301-335.

considerations identified in the *Guidelines*,³⁰⁰ as well as risk evaluations that EPA had recently completed on “new chemicals” under Section 5.

215. The factors that EPA considers under Section 5 substantially overlap with the factors that EPA considers under Section 6. Specifically, EPA considers the following three factors: (i) the hazardous nature of the chemical (as determined by toxicity values in animal studies);³⁰¹ (ii) the extent of human exposure to the chemical, and (iii) the Margin of Exposure (MOE). As I described in my report, fluoride meets each of these three criteria for unreasonable risk.

216. Importantly, whether one considers the factors under Section 5 or Section 6, the risk of neurotoxicity posed by fluoridation chemicals constitutes a clear and unreasonable risk, as will now be discussed.

A. Effects of Fluoridation Chemicals Under the Condition of Use

217. In most of the risk evaluations that EPA has conducted thus far under Section 6, the Agency did not have actual human data on health effects associated with the condition of use. EPA had to rely, therefore, on animal data alone. This is not the case with fluoridation. Critically, there are four prospective cohort studies that have examined the impact of optimal fluoride exposures, including two that examined the specific condition of use (water fluoridation) at issue.³⁰² Under the *Guidelines*, prospective cohort data permit “direct estimates of risks attributed to a particular

³⁰⁰ EPA (1998a), pp. 63-66.

³⁰¹ Under Section 5, a chemical is “considered to have high human health hazard if there is evidence of adverse effects in humans or conclusive evidence of severe effects in animal studies with a NOAEL of less than or equal to 10 mg/kg/day.” EPA (2018b; 2018c; 2018d; 2018e; 2018f; 2018g; 2019a). This criterion is readily satisfied with fluoride, as the LOAELs for cognitive deficits and brain abnormalities are below 10 mg/kg/day. Fluoride is thus a “high human health hazard” under Section 5.

³⁰² Bashash et al (2017, 2018); Green et al. (2019); Till et al. (2020).

exposure.”³⁰³ The effects of fluoridation chemicals under the condition of use are thus well characterized, particularly in comparison to chemicals (e.g., NMP, 1-BP) for which EPA has made unreasonable risk findings under TSCA.

B. Number of People Exposed to Fluoridation Chemicals

218. EPA has recognized that “the significance of the risk is dependent upon both the hazard (or toxicity) of the chemical substance and *the extent of exposure* to the substance.”³⁰⁴ Although EPA made this statement in the context of Section 5, EPA considers the extent of exposure to be a relevant factor under Section 6 as well. In the Section 6 risk determinations, the number of people (usually workers) who are exposed to the chemical are identified under each condition of use.³⁰⁵

219. This factor weighs in favor of an unreasonable risk finding for fluoridation chemicals. The extent of human exposure to fluoridation chemicals is nothing short of massive, much like lead exposure was during the era of leaded gasoline. Today, approximately 200 million Americans, or nearly 2/3 of the population, have municipal water to which fluoridation chemicals are added. Moreover, most of the remaining population living in “non-fluoridated” areas will routinely consume fluoridation chemicals in processed beverages and foods, as many beverages and foods are produced in fluoridated areas.³⁰⁶ To put these numbers in perspective, EPA has found unreasonable risks for conditions of use involving as few as 1,046³⁰⁷ and 1,900 occupationally-

³⁰³ EPA (1998a), p. 17.

³⁰⁴ EPA (2018b; 2018c; 2018d; 2018e; 2018f; 2018g; 2019a).

³⁰⁷ EPA (2019c), p. 264.

exposed workers.³⁰⁸ With such widespread exposure to fluoridation chemicals among the general population, even small risks can amount to widespread harm.

C. Exposure of Susceptible Subpopulations to Fluoridation Chemicals

220. One of the consequences from widely dispersing a toxicant through the environment (versus the use of industrial chemicals *within* manufacturing facilities) is that susceptible members of the general public may be exposed. This is the case with fluoridation chemicals. Each year, there are approximately **2.5 million pregnancies** in fluoridated areas; *in utero* exposures are thus widespread. Many of those exposed *in utero* will also be exposed during the sensitive neonatal period, with upwards of **1.9 million infants** living in fluoridated areas being fed formula at least part of the time, including **400,000 infants** who are *exclusively* formula-fed for their first six months. While these numbers do not account for those who use bottled water, the numbers will be substantial regardless.

D. The Severity of the Hazard (Cognitive Deficits/IQ Loss)

221. The principal hazard at issue from exposure to fluoridation chemicals is IQ loss. The prospective studies have found an approximate 5 to 6 point drop in IQ as maternal urinary fluoride levels increase from 0 to 1 mg/L.³⁰⁹ To put this in perspective, EPA has recognized that a loss of a single IQ point is associated with a loss in lifetime earnings,³¹⁰ and EPA's Clean Air Science Advisory Council has stated that "a population loss of 1-2 IQ points is highly significant from a public health perspective" and should be prevented in 99.5% of the population.³¹¹

³⁰⁸ EPA (2019d), pp. 307, 311.

³¹⁰ EPA (2008e), p. 5-28.

³¹¹ Federal Register (2008), p. 67000.

Consistent with this, EPA has established reference doses for chemicals based on observed cognitive deficits in animal studies (see Table 1 above). Cognitive deficits, including in the range observed in fluoridated areas, are a sufficiently severe effect on human health to warrant prevention, as EPA has recognized in other contexts.

E. Uncertainties

222. Uncertainties are a pervasive aspect of risk assessment; their existence does not negate a finding of risk. As would be expected, there are uncertainties in the fluoride dataset, arising in part from methodological limitations in the available animal studies (e.g., lack of control for litter effects, lack of blinding, lack of studies on neonatal exposures, lack of chronic experiments, etc.). The impact of these limitations on the observed learning and memory deficits is not yet defined. The clear suggestion from the observed findings, however, is that fluoride causes alterations to the brain and behavior. Further, the uncertainties that remain in the animal data are largely offset by the existence of high-quality prospective studies that have *consistently* detected significant associations between “optimal” fluoride exposures and cognitive deficits. While I understand that EPA’s experts in this case question whether the “causal” relationship between fluoridation and IQ loss has been proven, the *Guidelines* do not require proof of causation; they require sufficient evidence of association.³¹²

223. Another factor weighing in favor of an unreasonable risk finding is that the exposure estimates are more straightforward—and permit greater confidence—than the exposure estimates that EPA has had to extrapolate for other chemicals under TSCA. In its NMP risk evaluation, for example, EPA had to make “assumptions about glove use, glove effectiveness,

³¹² EPA (1998a), p. 53.

duration of contact with NMP, concentration of NMP, and amount of skin surface contact with NMP” in order to come up with estimates of human exposure under the conditions of use.³¹⁵ Estimating exposure to fluoridation chemicals involves much less uncertainty, as the concentration of fluoride in the water is defined (0.7 mg/L), and the EPA has extensive empirical data on water consumption in the U.S. that the Agency has described as “scientifically sound.”

224. Based on the available scientific evidence that now exists on the hazards, exposures, and risks of fluoride ingestion, the widespread addition of fluoridation chemicals to drinking water and processed foods in the United States presents an unreasonable risk to human health.

I declare under penalty of perjury, under the laws of the United States, that the foregoing is true and correct to the best of my knowledge and belief.

Executed on May 20, 2020, in Oak Ridge, Tennessee.

Appendix A

Recent Animal Studies of Fluoride Neurotoxicity (Tables A-1 and A-2)

Table A-1. Summary of animal studies that have investigated neuroanatomical and neurochemical endpoints of fluoride toxicity.

Paper	Animal	Sex	Maturity at Start of Exposure	Length of Exposure	Animals per group
Adebayo et al. 2013	Albino Rats	Male	Post-Weaning ^f	1 week	6
Adedara et al. 2017a & b	Wistar Rats	Male	8 weeks old	45 days	12
Agustina et al. 2018	Wistar Rats	Male	Adults	30 days	8
Akinrinade et al. 2015a & b	Wistar Rats	Male	Adults	30 days	5
Ameeramja et al. 2018	Wistar Albino Rats	Female	2 to 3 months old	30 days	6
Atmaca et al. 2014	Wistar Rats	Male	Post-Weaning ^f	21 days	7
Balaji et al. 2015	Swiss Albino Mice	Female	Adults	30 days	6 (of 7)
Banala and Karnati 2015	Wistar Rats	Both	Prenatal	Prenatal + 14, 21 & 30 days	5
Banji et al. 2013	Wistar Rats	Both	Gestational day 6	Prenatal + 15 days	6
Bartos et al. 2018	Wistar Rats	Female	Prenatal	Prenatal + 21 days	5
Bartos et al 2019	Wistar Rats	Both	Pre-Pregnancy	Prenatal + 21 days	5
Basha and Madhusudhan 2010	Wistar Albino Rats	Both	Pre-Pregnancy	Prenatal + 21 days	6
Basha et al. 2011a & b	Wistar Albino Rats	Both	Multigenerational	Prenatal + 12 weeks (3rd generation)	6
Basha and Sujitha 2012a & b	Wistar Rats	Male	3 months old	1 month	6
Basha and Saumya 2013	Albino Mice	Both	Adults	45 days	6
Bharti and Srivastava 2009	Wistar Rats	Female	Adults	28 days	6
Bharti et al. 2012	Wistar Rats	Female	Adults	7 days	6
Chauhan et al. 2013	Sprague-Dawley Rats	Female	6 months old	3 to 6 weeks	4 (of 8)
Chen et al. 2018a	Sprague-Dawley Rats	Female	Pre-Pregnancy	Prenatal + 6 months	6
Chouhan and Flora 2008	Albino Rats	Male	Adults	10 weeks	6
Chouhan et al. 2010	Wistar Albino Rats	Male	Adults	12 weeks	5-6 (of 6)
Dec et al. 2019	Wistar Rats	Males	Pre-Pregnancy	Prenatal + 90 days	6 (of 12)
Dong et al. 2015	Sprague-Dawley Rats	Both	1 month old	>10 months	30
Dong et al. 2015	Sprague-Dawley Rats	Both	10 months pre-birth	Prenatal + 1, 7, 14, 21, & 28 days	10
Flora et al. 2009	Swiss Mice	Male	Adults	10 weeks	5
Flora et al. 2012	Swiss Mice	Male	Adults	28 weeks	5 (of 12)
Ge et al. 2011	Wistar Albino Rats	Both	Pre-Pregnancy	Prenatal + 20 days	8
Ge et al. 2018	ICR Mice	Both	Pre-Pregnancy	Prenatal + 90 days	6
Güner et al. 2016	Wistar Albino Rats	Both	Adult	Prenatal + 1, 3, & 5 months	5

Table A-1. Summary of animal studies that have investigated neuroanatomical and neurochemical endpoints of fluoride toxicity - *Continued*

Paper	Treatment groups	LOAEL ^b	Specific Effect	Hippocampus?
Adebayo et al. 2013	100 mg/L	100 mg/L	Oxidative stress, reduced brain weight	No
Adedara et al. 2017a & b	6.8 mg/L	6.8 mg/L	Oxidative stress, reduced AChE activity, inflammation, Caspase-3 activity	No
Agustina et al. 2018	2.3, 4.5 & 9 mg/kg/day	4.5 mg/kg/day	Reduced number of Purkinje cells	No
Akinrinade et al. 2015a & b	1 & 5 mg/L	1 mg/L	Oxidative stress, inflammation, neuronal damage	No
Ameeramja et al. 2018	136 mg/L	136 mg/L	Oxidative stress	No
Atmaca et al. 2014	100 mg/L	100 mg/L	Oxidative stress & neuronal degeneration	Yes
Balaji et al. 2015	45 & 90 mg/L	45 mg/L	Inhibition of cholinesterase & increased oxidative stress	No
Banala and Karnati 2015	9 mg/L	9 mg/L	Oxidative stress	No
Banji et al. 2013	9 mg/kg/day	9 mg/kg/day	Oxidative stress	No
Bartos et al. 2018	5 & 10 mg/L (=0.6 & 1.2 mg/kg/d)	5 mg/L	Decreased nicotinic receptors & oxidative stress	Yes
Bartos et al. 2019	5 & 10 mg/L (=0.6 & 1.2 mg/kg/d)	5 mg/L	Increased oxidative stress as reflected by decreased CAT, GPT, and GOT	Yes
Basha and Madhusudhan 2010	50 & 150 mg/L	50 mg/L	Oxidative stress & reduced brain protein content	No
Basha et al. 2011a & b	100 & 200 mg/L	100 mg/L	Oxidative stress, reduced brain weight, and histological changes	Yes
Basha and Sujitha 2012a & b	270 mg/L	270 mg/L	Oxidative stress & decreased acetylcholinesterase activity	No
Basha and Saumya 2013	270 mg/L	270 mg/L	Mitochondrial disturbances & Oxidative stress	No
Bharti and Srivastava 2009	150 mg/L	150 mg/L	Oxidative stress	No
Bharti et al. 2012	150 mg/L	150 mg/L	Decreased acetylcholinesterase activity	No
Chauhan et al. 2013	11.3 mg/kg/day	11.3 mg/kg/day	Oxidative stress	No
Chen et al. 2018a	4.5, 23, 45 mg/L	4.5 mg/L	Impaired synaptogenesis	Yes
Chouhan and Flora 2008	10, 50, & 100 mg/L	100 mg/L ^c	Oxidative stress	No
Chouhan et al. 2010	1, 10, 50 & 100 mg/L	1 mg/L	Oxidative stress, alterations in neurotransmitters, neuronal lesions, & increased AChE activity	No
Dec et al. 2019	23 mg/L	23 mg/L	Evidence of inflammatory processes (reduced activity of cyclooxygenases (COX1 & COX2) and increase in prostaglandins)	Yes
Dong et al. 2015	50 mg/L (adults)	50 mg/L	Decrease in muscarinic nicotinic receptors	No
Dong et al. 2015	50 mg/L (offspring)	50 mg/L	Decrease in muscarinic nicotinic receptors	No
Flora et al. 2009	50 mg/L	50 mg/L	Oxidative stress, alteration in neurotransmitters, DNA damage, increased AChE activity	No
Flora et al. 2012	50 mg/L	50 mg/L	Oxidative stress, neuronal degeneration, DNA damage, Protein interaction	Yes
Ge et al. 2011	100 mg/L (+25 mg/kg in food)	100 mg/L	Alteration in protein expression	No
Ge et al. 2018	50 & 100 mg/L	50 mg/L	Alterations of synapse-related proteins	No
Güner et al. 2016	13.6 & 45 mg/L	13.6 mg/L	Neurodegenerative changes & catalase immunoreactivity	Yes

Table A-1. Summary of animal studies that have investigated neuroanatomical and neurochemical endpoints of fluoride toxicity – *Continued*

Paper	Treatment groups	LOAEL	Specific Effect	Hippocampus?
Hamza et al. 2015	4.7 mg/kg/day	4.7 mg/kg/day	Increased oxidative stress	No
Han et al. 2014	11, 23, and 45	23 mg/L ^c	Altered mRNA expression	Yes
Hassan and Abdel-Aziz 2010	4.7 mg/kg/day	4.7 mg/kg/day	Oxidative stress	No
Inkielwicz-Stepniak and Czarnowski 2010	25 mg/L	25 mg/L	Oxidative stress	No
Jia et al. 2019	6 & 113 mg/L	None	No reduction in neuronal density	No
Jiang et al. 2014a	54 mg/L	54 mg/L	Decreased glutamate levels	Yes
Jiang et al. 2014b	11, 23, and 45 mg/L	11 mg/L	Neuronal degeneration, decreased glucose utilization	Yes
Jiang et al. 2019	23 & 45 mg/L	23 mg/L	Impaired neurogenesis & synaptic plasticity	Yes
Kaur et al. 2009	125 mg/L	125 mg/L	Oxidative stress, alteration in neurotransmitters, & neuronal degeneration	No
Khan et al. 2018	20 mg/L	20 mg/L	Inhibition of AChE and increase in oxidative stress	No
Kinawy 2019	678 mg/L	678 mg/L	Oxidative stress	Yes
Li et al. 2019	68 mg/L	68 mg/L	Altered mRNA expression of anxiety & depression-related genes	Yes
Liu et al. 2010	5 & 50 mg/L	5 mg/L	Reductions in nicotinic receptors & activation of photoho-ERK1/2	No
Liu et al. 2011	5 & 50 mg/L	5 mg/L	Increased apoptosis & phosphorylation	No
Lou et al. 2013	10 & 50 mg/L	10 mg/L	Mitochondrial disturbances in neurons, altered protein expression	No
Ma et al. 2015	23 & 45.6 mg/L	23 mg/L	Increased BDNF expression	Yes
Mansour and Tawfik 2012	4.7 mg/kg/day	4.7 mg/kg/day	Oxidative stress	No
McPherson et al. 2018	10 & 20 mg/L (+ food exposure group)	None	No neuronal damage or glia reactivity	Yes
Nabavi et al. 2012a	270 mg/L	270 mg/L	Oxidative stress	No
Nabavi et al. 2012b	270 mg/L	270 mg/L	Oxidative stress	No
Nabavi et al. 2013	270 mg/L	270 mg/L	Oxidative stress	No
Niu et al. 2009	68 mg/L	68 mg/L	Decreased glutamate levels & altered enzyme activity	Yes
Niu et al. 2014	68 mg/L	68 mg/L	Altered protein expression	Yes
Niu et al. 2015a	11, 23, and 45 mg/L	23 mg/L	Microtubule lesions in neurons	Yes
Niu et al. 2015b	68 mg/L	68 mg/L	Alterations in protein expression	No
Niu et al. 2018a	4.5, 23, and 45 mg/L	4.5 mg/L	Endoplasmic reticulum stress	Yes
Niu et al. 2018b	11, 23, and 45 mg/L	11 mg/L	Myelin damage, and alteration to synaptic structure	Yes

Paper	Treatment groups	LOAEL	Specific Effect	Hippocampus?
Pal and Sarkar 2014	9 mg/kg/day	9 mg/kg/day	Oxidative stress, inhibited enzymes, altered neurotransmitters, reduced protein content	No
Pan et al. 2015	9 mg/kg/day	N/A ^d	Altered protein expression	Yes
Pereira et al. 2011	45 mg/L	45 mg/L	Alterations in neurotransmitters	Yes
Pulungan et al. 2018	2.3, 4.5 & 9 mg/kg/day	none	No reduction in number of pyramidal cells in medial prefrontal cortex	No
Qian et al. 2013	23 mg/L	23 mg/L	Impaired synaptic plasticity, oxidative stress, altered protein expression	Yes
Reddy et al. 2009	9 mg/kg/day	9 mg/kg/day	Oxidative stress & altered enzyme activity	No
Reddy et al. 2014	9, 27, & 45 mg/L	9 mg/L	Oxidative stress, alterations in neurotransmitters, and immunosuppression	No
Rogalska et al. 2017	4.5 & 23 mg/L	23 mg/L ^c	Increased glucose uptake	Yes
Samanta et al. 2016	5.9 mg/kg/day	5.9 mg/kg/day	Oxidative stress, cellular degeneration, apoptosis	No
Sarkar et al. 2014	9 mg/kg/day	9 mg/kg/day	Oxidative stress, inhibited enzymes, & reduced protein content	No
Shalini and Sharma 2015	10 mg/L	10 mg/L	Oxidative stress, reduced protein content & AChE activity	No
Sharma et al. 2014	120 mg/L	120 mg/L	Oxidative stress & cellular degeneration	Yes
Sharma et al. 2018	54 mg/L	54 mg/L	Oxidative stress and neuronal damage	Yes
Shen et al. 2019	200 mg/L	200 mg/L	Apoptosis and degeneration of nerve cells in spinal cord	No
Sun et al. 2017	45 mg/L	45 mg/L	Altered gene expression & apoptosis	Yes
Sun et al. 2018	11, 23, and 45 mg/L	11 mg/L (Fig 3b)	Altered mRNA expression	Yes
Teng et al. 2018	8.25, 16.5, & 33 mg/L	16.5 mg/L ^c	Elevated calcium in hippocampus	Yes
Trivedi et al. 2007	2.7 & 5.4 mg/kg/day	2.7 mg/kg/day	Reduced protein content	No
Wang et al. 2018a	11, 23, and 45 mg/L	11 mg/L (Fig 4b)	Altered expression of mi-RNAs	No
Wang et al. 2018b	45 mg/L	45 mg/L	Cellular degeneration, DNA damage	Yes
Wei et al. 2018	50 mg/L (adults)	50 mg/L	Neuronal injury (as evident by damage to Nissl bodies)	No
Wei et al. 2018	50 mg/L (offspring)	50 mg/L	Neuronal injury (as evident by damage to Nissl bodies)	No
Yan et al. 2016	60 & 120 mg/L	60 mg/L	Increased apoptosis & inflammation	Yes
Yang et al. 2018a	60 & 120 mg/L	60 mg/L	Apoptosis, altered protein expression, increased inflammation	Yes
Yu et al. 2019	2.3 & 13.6 mg/L	2.3 mg/L	Alterations of L-type calcium channels	Yes
Yuan et al. 2019	23, 45, 68 mg/L	23 mg/L	Reduced brain protein content, impaired insulin signaling pathway, reduced brain organ coefficient	Yes
Zhang et al. 2013a	45 mg/L	45 mg/L	Oxidative stress, neuronal loss, altered protein expression	Yes
Zhang et al. 2015a	5 & 50 mg/L	5 mg/L	Increased oxidative stress & activation of AGE/RAGE Pathway	Yes

Table A-1. Summary of animal studies that have investigated neuroanatomical and neurochemical endpoints of fluoride toxicity – *Continued*

Paper	Animal	Sex	Maturity at Start of Exposure	Length of Exposure	Animals per group
Zhang et al. 2017a	Sprague-Dawley Rats	Both	Pre-Pregnancy	Prenatal + 14 or 28 days	15-20 (of 20)
Zhang et al. 2019	Wistar Rats	Both	4 weeks old	3 months	2-3 (of 20)
Zhao et al. 2019	Sprague-Dawley Rats	Both	Pre-Pregnancy	Prenatal + 60 days	2-5 (of 15)
Zheng et al. 2016	Sprague-Dawley Rats	Male	Newly weaned	3 months	20
Zhou et al. 2019	Sprague-Dawley Rats	Female	Pre-Pregnancy	Prenatal + 6 months	6
Zhu et al. 2011 & Zhang et al. 2011	Sprague-Dawley Rats	Male	Just weaned	9 months	6 (of 12)
Zhu et al. 2017	Sprague-Dawley Rats	Both	Prenatal	Prenatal + 21 or 42 days	6 (of 8)

Table continued next page

Table A-1. Summary of animal studies that have investigated neuroanatomical and neurochemical endpoints of fluoride toxicity – *Continued*

Paper	Treatment groups	LOAEL	Specific Effect	Hippocampus?
Zhang et al. 2017a	45 mg/L	45 mg/L	Impaired synaptic plasticity	No
Zhang et al. 2019	25, 50, 100 mg/L	50 mg/L ^e	Autophagy in hippocampus	Yes
Zhao et al. 2019	4.5, 23, 45 mg/L	4.5 mg/L [Fig 6e]	Mitochondrial disturbances	Yes
Zheng et al. 2016	45 mg/L	45 mg/L	Increased apoptosis	Yes
Zhou et al. 2019	4.5, 23, 50 mg/L	23 mg/L ^c	Decreased neurons, suppressed autophagy, and enhanced apoptosis in hippocampus	Yes
Zhu et al. 2011 & Zhang et al. 2011	7, 13.6, & 27 mg/L	13.6 mg/L ^c	Decrease in synaptic membrane fluidity & increased calcium	Yes
Zhu et al. 2017	34 mg/L	34 mg/L	Altered protein expression in ERK/CREB signaling pathway	Yes

^a Where the study does not identify the sex of the animals, it is assumed that both sexes were studied.

^b A LOAEL refers to the lowest observed adverse effect level where a statistically significant result was observed.

^c At least one effect was seen at lower treatment doses (as reflected by a visually apparent dose-related trend), but the effect(s) at the lower treatment levels did not reach statistical significance.

^d The authors did not perform a statistical analysis to determine if the observed changes were statistically significant.

^e Ultrastructural observations of the rat hippocampal CA1 cells identified changes in the 25 mg/L group (i.e., increased lipofuscin content), but a statistical analysis of these changes was not performed.

^f Where the study does not identify the age of the animal at the start of the experiment, it is assumed that the animals had already completed weaning.

Table A-2. Summary of animal studies that have investigated toxic effects of fluoride on learning and memory

Paper	Strain	Sex ^a	Maturity at Start of Exposure	Length of Exposure	Animals per group

Zhu et al. 2017	45 mg/L (8 to 11 mg/kg/day)	Morris Water Maze	45 mg/L

^a Where the study does not identify the sex of the animals, it is assumed that both sexes were studied.

^b A LOAEL refers to the lowest observed adverse effect level where a statistically significant result was observed.

^c At least one effect was seen at lower treatment doses (as reflected by a visually apparent dose-related trend), but the effect(s) at the lower treatment levels did not reach statistical significance.

^d At least one statistically significant effect was seen at lower treatment doses but for a neurological endpoint that is not specific to learning or memory impairments.

^e The effect in the fluoride + lead treatment group was statistically significant, but the effect in the fluoride-only treatment group did not reach statistical significance.

^f A statistically significant effect was observed in the low treatment dose group (5 mg/kg/day) when compared to the control, but there were no significant differences between the control and mid/high dose treatment groups (10 mg/kg/day & 20 mg/kg/day).

^g Where the study does not identify the age of the animal at the start of the experiment, it is assumed that the animals had already completed weaning

Appendix B

KATHLEEN M. THIESSEN, Ph.D.
Senior Scientist
Oak Ridge Center for Risk Analysis, Inc.

Education

Ph.D. 1986 Genetics, University of Tennessee-Oak Ridge, Graduate School of Biomedical Sciences, Oak Ridge, TN
B.A. 1981 Biology and Chemistry (*Summa cum laude*), Covenant College, GA

Capabilities

Health Effects Assessment
Dose and Risk Assessment
Analysis of Environmental Transport and Exposure Pathways
Uncertainty and Sensitivity Analysis
Technical Writing/Editing, Technical and Public Presentations

Experience Summary

Dr. Thiessen is experienced in the evaluation of exposures, doses, and risks to human health from trace levels of contaminants in the environment and in the use of uncertainty analysis for environmental and health risk assessment. She has served on two National Research Council subcommittees, one charged with the review of fluoride exposure and toxicology, and one dealing with guidance levels for air contaminants (including hydrogen fluoride) in submarines. Dr. Thiessen has also written two reports for the U.S. Environmental Protection Agency, one on the health effects of hydrogen fluoride and related compounds, and one on the health effects of mercuric chloride. Dr. Thiessen has led several working groups on urban contamination and dose reconstruction for the International Atomic Energy Agency's programs on environmental transport modeling and has served on the coordinating committees of the programs; she currently leads a working group on assessment of exposures and countermeasures in urban environments. She also serves on a committee for the preparation of a new International Atomic Energy Agency report on modeling the impacts of planned discharges or radioactivity, and she is involved in the preparation of an IAEA guidance document on implementation of remediation strategies following accidental releases of radioactivity. Dr. Thiessen participated in two symposia on reconstruction of internal doses from Fukushima releases organized by Japan's National Institute of Radiological Sciences, and she has served as a consultant on environmental modeling issues to the Korea Atomic Energy Research Institute and on uncertainty analysis to the National Council on Radiation Protection and Measurements. Dr. Thiessen contributed to the development of a risk-based screening approach to prioritize further investigation of contaminants and exposure situations in various assessment contexts, and she led in the application of risk-based screening techniques for the reconstruction of doses and health risks associated with releases of chemicals and radionuclides from the U.S. Department of Energy's Oak Ridge (Tennessee) facilities. Dr. Thiessen also led an analysis of human exposures, doses, and health risks to off-site individuals associated with historic releases of radionuclides to the Clinch River from the Oak Ridge facilities.

Experience

- 1992-present Senior Scientist and Director, Oak Ridge Center for Risk Analysis, Inc. (Formerly *SENES* Oak Ridge, Inc., Center for Risk Analysis), Oak Ridge, TN.
- Review of data on contaminant exposure and toxicology.
 - Analysis of environmental transport and exposure pathways.
 - Screening techniques for environmental assessment.
 - Dose reconstruction.
 - Uncertainty analysis for environmental assessment.
 - International model validation using Chernobyl data sets.
 - Working Group Leader for International Atomic Energy Agency research programs.
 - Project coordination.
 - Technical review.
- 1991-1992 Consultant and Technical Writer. Environmental Sciences Division, Oak Ridge National Laboratory, Oak Ridge, TN.
- 1987-1992 Lecturer in Genetics. University of Tennessee, Oak Ridge Graduate School of Biomedical Sciences.
- 1986-1989 Oak Ridge National Laboratory, Health and Safety Research Division, Chemical Hazard Evaluation Program.
- Assessment of health effects from chemicals.
 - Risk assessment.
 - Technical review.

I, Bruce Lanphear, MD, MPH, declare that:

1. I am a Clinical Investigator at the BC Children's Hospital Research Institute, BC Children's Hospital, and Professor in the Faculty of Health Sciences at Simon Fraser University in Vancouver, British Columbia.

2. I am also the Co-Principal Investigator of an ongoing study to examine the impact of early-life fluoride exposures on intellectual abilities in a cohort of mothers and offspring from Canada known as the MIREC Study. Our study of fluoride and IQ in the MIREC cohort was funded by a grant from the U.S. National Institutes of Health (NIH).

I. SUMMARY OF QUALIFICATIONS

3. A complete summary of my qualifications and publications can be found in my Curriculum Vitae, which has been marked as Plaintiffs' Exhibit 6 and attached herein.

4. I have studied the impact of toxic chemicals, including lead and pesticides, on children's brain development for over 20 years. My research has been almost exclusively funded by federal agencies, including the Environmental Protection Agency (EPA), Centers for Disease Control and Prevention, the Department of Housing and Urban Development, Health Canada, National Institute of Allergy and Infectious Diseases, National Institute for Child Health and Human Development, National Institute of Environmental Health Sciences, National Institute of Neurologic Diseases, and the National Heart, Lung and Blood Institute.

5. My research has been published in leading medical and scientific journals, including *Journal of the American Medical Association*, *New England Journal of Medicine*, and *Pediatrics*, and has been extensively relied upon by environmental and public health agencies, including the EPA. My pooled analysis of blood lead and IQ (Lanphear 2005) was cited by the EPA as the critical study upon which the Agency based the current national air standard for lead.

1 6. I have served on the editorial boards of seven academic journals, including *Public Health*
2 *Reports* (the official journal of the U.S. Surgeon General), *PLoS Medicine* (a peer-reviewed medical
3 journal published by the Public Library of Science), and *Environmental Health Perspectives* (a journal
4 funded by the National Institutes of Environmental Health Sciences).

5 7. I have served on numerous scientific committees on environmental health issues impacting
6 children, including multiple scientific advisory boards for the EPA and the Executive Council on
7 Environmental Health for the American Academy of Pediatrics. My work with the EPA has included
8 invited expert advisory roles on EPA's (i) Science and Research Work Group of the Children's Health
9 Protection Advisory Committee (1998-2001); (ii) Workshop on Assessing Environmental Exposures to
10 Children (2000-2002); (iii) Clean Air Scientific Advisory Committee (2006-2008); (iv) Science Advisory
11 Board for Evaluating Dust Lead Standards (2010-2012); and (v) Science Advisory Board for Evaluating
12 Hazards of Partial Water Line Replacement (2011-2012).

13
14 8. My research has earned various awards and honors, including the Research Integrity Award
15 from the International Society for Environmental Epidemiology in 2012, the Public Policy and Advocacy
16 Award from the Academic Pediatric Association in 2013, and the Research Award from the Academic
17 Pediatric Association in 2015.

18
19 9. I have been involved with the MIREC Study for over 10 years. I was a Co-Principal
20 Investigator for the neurobehavioral assessments conducted when the children were 3 to 4 years old and I
21 oversaw the neurodevelopmental assessments in Vancouver. I have been a coauthor of twelve publications
22 from the MIREC Study, including three publications on fluoride described below.

23
24 10. In light of the consistent association between elevated fluoride and IQ reported in cross-
25 sectional studies (Choi, et al. 2012), we received a grant from the NIH to study the association between
26 prenatal and early-life measures of fluoride and IQ in children in the MIREC cohort. To date, we have
27

published three peer-reviewed studies, including the most extensive assessment of fluoride exposure during pregnancy ever conducted and prospective studies on early life fluoride exposure on IQ. These studies have been published in *Environmental Health Perspectives*, *JAMA Pediatrics*, and *Environment International* (Till 2018, Green 2019, Till 2020). Our study on prenatal fluoride and IQ was the highest scoring study in *JAMA Pediatrics* in 2019 (Christakis 2020).

11. I agreed to participate as a non-retained expert in this case because I believe it is a public duty to present the results of studies that suggest substantial risk to public health. I have asked *not* to be compensated for this work.

II. SUMMARY OF OPINIONS

12. Our study of prenatal fluoride and IQ in the MIREC cohort (Green 2019) further enhances the quality of data related to the neurotoxicity of fluoride. As with the ELEMENT cohort, we employed a prospective cohort design, had extensive control for potential confounders, and had multiple measures of fluoride exposure during pregnancy, including three types of urinary fluoride measurements for each trimester of pregnancy.

13. The maternal urinary fluoride levels in the MIREC cohort were significantly associated with lower intellectual abilities in 3-4-year-old children. These associations remain large and significant when controlling for relevant covariates.

14. Converging results from the MIREC and ELEMENT cohorts indicate that exposure to “optimal” levels of fluoride during fetal development is associated with diminished intelligence in childhood.

15. In the MIREC cohort, exposure to fluoridated water in infancy, particularly among formula-fed infants, was also associated with diminished intelligence (Till 2020). This association remains significant after controlling for fetal fluoride exposure and other relevant covariates, suggesting that

1 susceptibility to fluoride's adverse neurological effects may extend into infancy.

2 **III. BASIS FOR OPINIONS**

3 **A. The Growing Problem with Brain-Based Disorders**

4 16. As I have discussed elsewhere, the causes of death and disability in children have shifted
5 over the past century (Lanphear 2015). Concerted public health efforts to control tuberculosis, cholera,
6 typhoid, and other infectious agents in the early twentieth century led to a dramatic reduction in child
7 mortality, followed by a rise in life expectancy. By the end of the twentieth century, the 'new morbidities
8 of childhood' had emerged: attention deficit hyperactivity disorder (ADHD), autism, asthma, obesity, and
9 preterm birth. Learning disabilities and neurodevelopmental disorders are now two of the most prevalent
10 morbidities in children. About 7.6% of US children are estimated to have a learning disability, and 13%
11 are estimated to have a neurodevelopmental disorder, including anxiety, autism, conduct disorder,
12 depression, or ADHD (Lanphear 2015). These data indicate that we are in the midst of an epidemic of
13 brain-based disorders.
14

15 17. Neurotoxicants can have a lifelong impact on brain function. Children who have higher
16 blood lead concentrations, for example, may never meet the same peak cognitive ability in adulthood as
17 that in less exposed children. At the other end of the age spectrum, cognitive decline is accelerated in
18 adults who have higher bone lead concentrations and some evidence has shown that lead exposure is a
19 risk factor for the development of late-onset Alzheimer's disease. Few birth cohorts have been studied
20 into adulthood; however, it would be surprising if the effects of other neurotoxicants observed in school-
21 aged children do not persist into adulthood (Lanphear 2015). The cumulative impact of exposures to
22 various toxins that only modestly impact intellectual abilities can be substantial (Lanphear 2015).
23

24 18. The high reported prevalence of learning disabilities and neurodevelopmental disorders has
25 fueled research to better understand the role of environmental chemicals, including the use of prospective
26
27

1 cohort studies that collect individualized biomarkers of exposure to environmental toxins. Biologic
2 markers, or biomarkers, of exposure, which can enhance our ability to quantify an individual's internal
3 dose of a contaminant, are revolutionizing the study of environmental toxins in the same way genetic tests
4 are revolutionizing the study of heritability (Lanphear 2015).

5 **B. The MIREC Cohort Is a Comprehensively Characterized Birth Cohort**

6 19. The MIREC¹ cohort in Canada was developed to obtain biomonitoring data for pregnant
7 women and their infants to examine potential adverse health effects of early-life exposure to
8 environmental chemicals.

9 20. The MIREC cohort is a geographically diverse and comprehensively characterized birth
10 cohort. Women were recruited during the first trimester of pregnancy from 10 cities across Canada,
11 including cities that add fluoride to water for caries prevention purposes (e.g., Toronto), and cities that do
12 not (e.g., Vancouver). Women were followed through delivery and their offspring have undergone
13 periodic neurodevelopmental tests, including IQ testing.

14 21. We administered questionnaires during pregnancy and early childhood to collect
15 information on demographics, occupation, lifestyle, medical history, environmental exposures and diet.
16 Dietary questions included whether the mother drank tap water during pregnancy, how many glasses of
17 water and other beverages she consumed, and duration of breastfeeding.

18 22. Information on the pregnancy and the infant was abstracted from medical charts. Maternal
19 urine was collected at multiple points throughout pregnancy, as was blood, urine, hair, breast milk, cord
20 blood and infant meconium. These samples have been archived in a biobank.

21 23. Study staff from each participating study site completed a 3-day training session that was
22

23
24
25

¹ MIREC stands for Maternal-Infant Research on Environmental Chemicals. It is an
26 interdisciplinary collaboration between Health Canada scientists and clinical and academic researchers,
27 and was funded by Health Canada, the Ontario Ministry of the Environment, and a grant from the
28 Canadian Institutes of Health Research.

led by a PhD-level psychologist and focused on specialized training of the neurodevelopmental tests. The training emphasized the importance of providing an ideal and standardized environment in the home by ensuring that the test area was well-lit, quiet, and free from distractions and interruptions.

C. Urinary Fluoride Study (Till 2018)

24. In 2018, we published the most comprehensive study of urinary fluoride during pregnancy that has ever been conducted (Till 2018). Our study included 1,566 pregnant women from the MIREC cohort who had urine samples for each trimester of pregnancy. It was the first study of its kind in water-fluoridated areas of North America. A similar study has recently been published of a smaller pregnancy cohort in California (Uyghurturk 2020), but our study remains the largest and most thorough.

1. Methodological Strengths

25. Our study of urinary fluoride was conducted in accordance with sound and objective science practices. Important strengths of the study include: (1) a large study size, with over 1,500 women and over 5,000 urine samples; (2) collection of urine samples from each trimester for each mother; (3) empirical data on the actual measured water fluoride levels for each mother's water treatment plant boundary (WTP) during the course of the pregnancy; (4) control for other factors that have potential to influence urinary fluoride excretion, including tea consumption, alcohol use, pre-pregnancy BMI, maternal age, maternal education, annual household income, and race; (5) control for fluctuations that can occur in urine fluoride during the day by adjusting for dilution using two methods (specific gravity and creatinine) and controlling for time of void and time since last void; and (6) measurement of fluoride in urine using the same scientist (Dr. Martinez-Mier), method (microdiffusion), and laboratory (University of Indiana) as the ELEMENT cohort, thereby enhancing the comparability of the data.

26. Dr. Martinez-Mier's lab at the University of Indiana is considered a gold-standard lab for the testing of fluoride in urine and blood. EPA appears to recognize Dr. Martinez-Mier's expertise as she

was approached by EPA to serve as an expert in this case.

2. Fluoridated Water Has a Large and Significant Effect on Urinary Fluoride

27. In our study, fluoride in water had the strongest correlation with urine fluoride of all the factors that we measured, thus confirming that fluoridated water remains a major source of fluoride intake (Till, 2018).

28. The average urinary fluoride level among pregnant women in fluoridated areas is almost two times higher than the average levels in nonfluoridated areas (Till 2018).

29. The average creatinine-adjusted² maternal urinary fluoride level in the fluoridated areas is 0.87 mg/L, versus 0.46 mg/L in the non-fluoridated areas.³

30. Our data suggests that, for every 0.5 mg/L increase in water fluoride level, urinary fluoride levels will increase by 74-82%.

31. Our findings are consistent with prior studies showing that, among adults, fluoride levels in urine are closely correlated with the concentration of fluoride in water.

32. As part of our study, we attached a table showing the full distribution of urinary fluoride levels, including the 75th and 95th percentile exposures for each trimester (Till et al. 2018, Table S4). At the second trimester, 95th percentile values in the fluoridated areas were 2 mg/L (adjusted for creatinine), and 1.63 mg/L (adjusted for specific gravity).

² Creatinine-adjustment of spot urine samples adjusts for dilution and has been found to have good agreement with 24-hour fluoride values (WHO 2014, Zohouri 2006). We used the same method for creatinine adjustment as Bashash (2017). We also adjusted for dilution by correcting for specific gravity. Our adjustments for creatinine and specific gravity produced results that were highly correlated ($r = 0.91$) and interchangeable in our analyses of the factors that increase urinary fluoride.

³ The average specific gravity-adjusted concentration in the fluoridated areas was 0.71 mg/L (SD 0.38 mg/L), with a range of 0.10 to 3.12 mg/L.

3. Pregnant Women in Water-Fluoridated Areas of the MIREC Cohort Have Similar Urinary Fluoride Levels as the ELEMENT Cohort

33. One of the key findings from our 2018 study is that pregnant women who live in water-fluoridated areas of Canada have urinary fluoride levels that are essentially the same as the urinary fluoride levels documented in the ELEMENT cohort.

34. The similarity in maternal urinary fluoride levels between the MIREC and ELEMENT cohorts can be appreciated when comparing the respective mean values (0.87 vs. 0.91 mg/L), standard deviations (0.50 vs. 0.40 mg/L), and ranges (0.14-3.80 vs. 0.02-3.67 mg/L) of the study participants in the water fluoridated areas of the MIREC cohort vs. the ELEMENT cohort.

35. The similarity in maternal urinary fluoride levels between the MIREC and ELEMENT cohorts is of scientific and public health relevance given the findings of Bashash (2017) showing an inverse association between maternal urinary fluoride and offspring IQ.

D. Prenatal Fluoride/IQ Study (Green 2019)

36. In 2019, we published our findings on the relationship between prenatal fluoride exposure and IQ in the MIREC cohort. The study, which was published in *JAMA Pediatrics*, provides reliable and unbiased results and was conducted in accordance with sound and objective science practices.

1. Methodological Strengths

37. ***Prospective Birth Cohort Study Design:*** A key strength with our study is that we used a prospective cohort study design, also known as a longitudinal study. Prospective studies are the best available method for investigating the impact of environmental chemicals and, as noted earlier, have helped to revolutionize our understanding of how chemicals impact childhood health.

38. ***Extensive Control for Potential Confounders:*** The MIREC cohort is one of the most comprehensively characterized birth cohorts, with abundant individualized data on factors that may influence neurodevelopment. We took full advantage of this data. We excluded study participants if there

was a known fetal abnormality, if they had any medical complications (i.e., cancer, renal disease, cardiovascular disease), or if there was known maternal alcohol or drug abuse during pregnancy. For analyses using water fluoride, we excluded women if they did not drink tap water during their pregnancy. For those not excluded, we controlled for the following factors: maternal education; maternal age; quality of the child's home environment (HOME); child sex; mother's race; city of residence; secondhand smoke; maternal blood or urinary concentrations of other neurotoxicants, such as lead, arsenic, mercury, manganese, and PFOA. Additionally, we controlled for the diurnal fluctuations that may occur in urinary fluoride levels by including time of day that the urine sample was collected and time since last void.

39. ***Individualized Measures of Fluoride Exposure:*** Another important strength of our study is that we had multiple individualized measures of prenatal fluoride exposure, including: (1) urinary fluoride samples averaged across each trimester of pregnancy and corrected for urinary dilution; (2) measured water fluoride levels from within each participant's water treatment plant boundary during the course of their pregnancy;⁴ and (3) questionnaire data about how much water each woman drank from tap water and water-based beverages.

40. ***Large, Multi-Center Cohort:*** Our study included 512 mother-offspring pairs which is a robust sample size for statistical analyses. Further, the mother-offspring pairs came from 6 cities across Canada, some of which fluoridate their water (average F = 0.59 mg/L), and some of which do not (average F = 0.13 mg/L).⁵ Our study thus permitted us to examine the impact of fluoride exposures on IQ in communities with water fluoridation, thus addressing what some have perceived to be a limitation of prior

⁴ Water treatment plants measured fluoride levels daily if fluoride was added to municipal drinking water and weekly or monthly if fluoride was not added to water. We matched participants' postal codes with water treatment plant zones, allowing an estimation of water fluoride concentration for each woman by averaging water fluoride concentrations (in milligrams per liter) during the duration of pregnancy.

⁵ Pregnant women in the fluoridated areas tended to have higher incomes and more education, which may help explain the lack of difference in average *unadjusted* IQs between fluoridated and non-fluoridated areas (Green 2019, Table 1).

studies of fluoride neurotoxicity.

41. ***Reliable and Objective IQ Test:*** We assessed children’s intellectual abilities with the Wechsler Preschool and Primary Scale of Intelligence, Third Edition (WPPSI-III). This is a validated IQ test with excellent internal reliability ($r = 0.96$), and good test-retest reliability ($r = 0.86$). We used Full Scale IQ (FSIQ), which is a measure of global intellectual functioning, as the primary outcome. The FSIQ score is comprised of two composite scores: Verbal IQ (VIQ)—representing verbal reasoning and comprehension—and Performance IQ (PIQ)—representing nonverbal reasoning, spatial processing, and visual-motor skills.

42. ***Blinded Assessments:*** As with the ELEMENT cohort, our study was “blinded,” meaning the examiners were not aware of the mother’s fluoride exposure status at the time of the examination. This eliminates the potential for examiner bias.

43. ***Statistical Analyses that Did Not Assume Linearity:*** We conducted sound, objective, and rigorous statistical analyses that: (i) controlled for the impact of the large number of measured covariates; (ii) examined the data for collinearity, outliers, and influential points; and (iii) scrutinized the shape of the relationship between fluoride and IQ. With respect to linearity and possible threshold effects, we conducted sensitivity analyses that used quadratic and natural log effect models as well as ran spline analyses that examined the relationship below 0.5 mg/L, 0.8 mg/L, and 1.0 mg/L in urine (and below 0.4 mg/day and 0.8 mg/day in fluoride intake). We did *not* assume that statistical associations between fluoride and IQ were linear and without threshold.

44. Short of intentionally dosing pregnant mothers with fluoride, we maximized the power of environmental epidemiology to investigate whether prenatal fluoride exposure is associated with neurocognitive deficits in a prospective, observational cohort study.

2. Prenatal Fluoride Exposure Is Associated with Large and Significant Reductions in IQ in the MIREC Cohort

45. All three measures of prenatal fluoride exposure—(i) maternal urinary fluoride, (ii) maternal fluoride intake from beverages, and (iii) water fluoride concentration during pregnancy—were associated with large, statistically significant decreases in IQ among the 3 to 4-year old children in the MIREC cohort.

46. After controlling for covariates, a 1-mg/L increase in maternal urinary fluoride⁶ was associated with a **4.49 lower IQ** score (in boys); a 1-mg higher daily intake of fluoride from beverages was associated with a **3.66 lower IQ** score (in boys and girls); and a 1 mg/L higher water fluoride concentration was associated with a **5.29 lower IQ** score (in boys and girls). These fluoride-associated reductions in IQ that we found showed a linear, dose-response relationship with no apparent indication of a threshold (see figures below).

⁶ We used specific gravity (SG) as the primary adjustment method for this study. The average SG-adjusted concentration among women from the fluoridated areas was 0.69 mg/L (SD = 0.42), which is consistent with the concentration in fluoridated areas from the larger cohort (0.71 mg/L, SD = 0.38) (Till 2018). Sensitivity analyses using the creatinine-adjusted urinary fluoride values did not change the results between fluoride and IQ (Green 2019, eTable 2).

47. The effect sizes that we found are large and rival the impact of a population blood lead concentration of 5 $\mu\text{g}/\text{dL}$.⁷ Fourteen percent of the women had urinary fluoride concentrations exceeding 1.0 mg/L, and thus the impact for some children may exceed the ranges identified above.

48. Although maternal urinary fluoride was associated with significant reduction in full-scale IQ in boys, it was not associated with diminished full-scale IQ in girls. As is often the case, the reason for this discrepancy is not currently known. It is known, however, that boys have a higher prevalence of neurodevelopmental disorders such as ADHD, learning disabilities, and intellectual disabilities than girls. It is also known that boys and girls may respond differently to some neurotoxicants. In our studies of the MIREC cohort, for example, we found that low levels of blood lead correlate with a loss of IQ in boys, but not girls (Desrochers-Couture 2018).

49. The possibility that boys are more sensitive to prenatal fluoride exposure than girls is

⁷ My pooled analysis of blood lead and IQ found that an increase in childhood blood lead from <1 to 10 $\mu\text{g}/\text{dL}$ was associated with a 6.9 IQ point decrement (Lanphear 2015, p. 814). General population exposures to lead today are now on the low-to-mid range of this spectrum, with relatively few children having blood lead levels as high as 10 $\mu\text{g}/\text{dL}$.

supported by at least one animal study, in which males had greater deficits from prenatal exposure and females had greater deficits from postnatal exposure (Mullenix et al 1995). While we did not find sex-specific differences with our other two exposure measures (water F concentration and water F intake), these other measures may better correlate with chronic or postnatal exposure and thereby reflect distinct risks.

3. Convergent Findings of ELEMENT and MIREC Cohorts.

50. The significant associations we observed between prenatal fluoride and IQ in the MIREC cohort are consistent with the findings from the ELEMENT cohort (Bashash, 2017).

51. In the ELEMENT study, an increase of 1 mg/L in creatinine-adjusted maternal urine was associated with a loss of 6.3 IQ points among 4-year olds, as measured by General Cognitive Index (GCI) of the McCarthy Scales of Children's Abilities. In our analysis, an increase of 1 mg/L in creatinine-adjusted maternal urine was associated with a loss of 4.96 IQ points among 3- to 4-year old boys, as measured by the WPPSI-III test (Green 2019, eTable 2). These effect sizes are generally consistent with each other.

52. The consistency of results in both population cohorts adds further confidence that the association is real, particularly when viewed in the context of other studies that have reported inverse associations between fluoride and IQ in many different locations in other countries, as well as general knowledge about the vulnerability of the developing brain.

E. Infant Fluoride/IQ Study (Till 2020)

53. We recently completed and published a study that examined whether fluoride exposures during infancy have an influence on IQ at 3-4 years (Till 2020).

54. Concerns have been raised about the use of fluoridated water in baby formula due to the high intake of water by bodyweight during infancy. These high intakes have been associated with

significant increases in dental fluorosis, including in the permanent teeth.

55. In our study, we obtained information about fluoride intake of infants through questionnaires that the mothers completed when the children were 30 to 48 months of age.⁸ The questionnaire included the question, “How old was your baby when you ceased breastfeeding exclusively?” Women who breastfed exclusively for six months or longer were included in the breastfeeding (BF) group; those who reported introducing formula within the first six months (never breastfed or partial breastfeeding) were included in the formula-feeding (FF) group.

56. As a separate measure of infant fluoride exposure, we estimated fluoride intake by obtaining the measured water fluoride levels within the water treatment plant boundary during infancy. We took the average of these levels, multiplied by the amount of time that the infant was not exclusively breast-fed during the first year,⁹ and divided it by the estimated average water intake among Canadian formula-fed infants (0.8 L). We excluded any mother-offspring pair if the mother reported not drinking tap water.

1. Methodological Strengths

57. Our study of infants shares many of the same methodological strengths as our prenatal study, including: (i) prospective cohort design; (2) extensive control for potential confounders (discussed below); (3) blinded assessment; (4) relatively large cohort (398 mother-offspring pairs) from both fluoridated and non-fluoridated areas; (5) the same validated and standardized IQ test that we used for the prenatal study (i.e., Wechsler Primary and Preschool Scale of Intelligence-III); and (6) rigorous statistical

⁸ The answers to these questions correlated well with the contemporaneous infant feeding practices that were reported among 11% of the cohort. Among women with breastfeeding questionnaire data and infant feeding observation data, the median difference for when breast-feeding ceased was 0 months, with two-thirds being within 1.5 months of each other.

⁹ The mean duration of exclusive breastfeeding was 4.98 months; 13.6% of women reported never breastfeeding, 8% reported discontinuing breastfeeding after the first three months, and 50.2% reported continuing to breastfeed at six months or longer. Average water fluoride concentration did not significantly differ between the BF (mean=0.32 mg/L) and FF groups (mean=0.29 mg/L; p=.18).

analyses that tested for sex-specific effects and scrutinized the impact of outliers and influential points.

58. We adjusted for potential confounding by selecting covariates *a priori* that have been associated with fluoride, breastfeeding, and children's intellectual abilities. Final covariates¹⁰ included child's sex and age at testing, maternal education, maternal race, second-hand smoke in the home, and quality of the child's home environment (measured at time of testing using the Home Observation for Measurement of the Environment (HOME)). We also controlled for fetal fluoride exposure, using the previously measured maternal urinary fluoride concentrations averaged across each trimester of pregnancy.

2. Fluoride Exposure During Infancy Is Associated with Significant Reductions in Non-Verbal IQ in the MIREC Cohort

59. We found that fluoride exposure during infancy is associated with significant reductions in non-verbal IQ in the MIREC cohort.

60. For each 0.5 mg/L increase in water fluoride concentration, we found a decrease of 4.4 Full-Scale IQ (FSIQ) points among preschool children who were formula-fed in the first six months of life; 0.5 mg/L is the approximate difference in mean water fluoride level between fluoridated (0.59 mg/L) and non-fluoridated (0.13 mg/L) regions. In contrast, we did not find a significant association between water fluoride concentration and FSIQ among children who were exclusively breastfed in the first 6 months.

61. The association between water fluoride concentration and FSIQ must be interpreted with caution, however, because the association became nonsignificant when two outliers were removed.

62. We observed an even stronger association between water fluoride and PIQ (non-verbal intelligence). A 0.5 mg/L increase in water fluoride level predicted a decrement in non-verbal IQ in both

¹⁰ For each analysis, a covariate was retained in the final model if its p-value was <0.20 or its inclusion changed the regression coefficient of water fluoride concentration or fluoride intake from formula by more than 10%.

1 the formula-fed (**9.3-points**) and the breastfed groups (**6.2-points**). Adjusting for fetal exposure or
2 removing two extreme scores did not appreciably alter these results.

3 63. We observed converging results using fluoride intake from formula feeding, which is a
4 continuous, time-weighted exposure estimate. For each 0.5 mg/day of fluoride intake, we found an **8.8-**
5 **point** decrement in non-verbal IQ; adjusting for fetal exposure attenuated the association only slightly
6 (**7.6-point** decrement).

7 64. The time-weighted fluoride intake estimate may reflect a more refined measure of exposure
8 in infancy because it captures differences in both water fluoride level and the proportion of time each child
9 was given formula over the first year of life. Yet, our binary classification of whether a child was
10 exclusively breastfed for the first 6 months may distinguish infants who are exposed to higher amounts of
11 fluoride during the early infancy period when the brain undergoes significant development because breast
12 milk contains minutes amounts of fluoride.

13 65. Taken together, these findings suggest that using “optimally” fluoridated water (0.7 mg/L)
14 to reconstitute infant formula may diminish the development of intellectual abilities in young children,
15 particularly non-verbal abilities. The findings also suggest that both prenatal and early childhood fluoride
16 exposure affect the development of non-verbal intelligence to a greater extent than verbal intelligence.
17 Prior studies examining prenatal exposure to fluoride and IQ showed a similar pattern.
18

19
20 **F. The Limitations of Our Studies Do Not Provide a Likely Explanation for the**
21 **Results**

22 66. As with all epidemiological studies, our fluoride studies have limitations. These
23 limitations, however, are unlikely to explain the large and significant associations that we have found
24 between early-life exposures and IQ.

25 67. Most of the limitations in our studies involve fluoride measurement. These limitations
26
27

1 include: (1) use of spot urine samples instead of 24-hour samples;¹¹ (2) lack of water fluoride
2 measurements from the participant's home; (3) reliance on questionnaire data as to water consumption
3 and breast-feeding; (4) lack of information on the fluoride content of the infant formula concentrate and
4 other sources of fluoride exposure; and (5) use of non-validated methods¹² for estimating total beverage-
5 based intake of fluoride by mothers and water fluoride intake by infants.

6 68. The limitations in our exposure estimates are non-differential, meaning they apply equally
7 to study participants with low fluoride exposure and high fluoride exposure. Non-differential errors in
8 exposure measurement will generally bias the results towards the null (i.e., attenuate, rather than inflate,
9 an association between exposure and outcome). Because of this, the limitations in our exposure estimates
10 do not provide a likely explanation for the significant IQ decrements we observed with fluoride exposures.
11 If anything, these limitations likely attenuated the relationship.
12

13 69. Another limitation of our studies is that the MIREC cohort tends to be more affluent, more
14 educated, and less ethnically diverse than the general population. Our results may thus not be
15 representative of how fluoride may affect IQ in more disadvantaged populations. On the other hand.
16 affluent populations tend to have less confounders (e.g., less exposure to other stressors and toxicants that
17 can negatively affect neurodevelopment) (Lanphear 2015). We thus worry less about the role of
18 confounders in the MIREC cohort than we would in other cohorts.
19

20 70. Finally, despite our comprehensive array of covariates included, our studies could not
21 address the possibility of unmeasured residual confounding. This is a limitation in all observational
22

23 ¹¹ A 24-hour sample of urine is considered the optimal dosimeter for measuring chronic fluoride
24 exposure (WHO 2014). While we did not have 24-hour samples available to test, we partially controlled
25 for this by adjusting samples by creatinine. Creatine-adjusted urine fluoride measurements have been
26 found to have a strong correlation with 24-hour samples (Villa 2010; Zohouri 2006).

27 ¹² These methods were not validated in the sense that they have not yet been replicated by other
28 authors in other studies. Our method for assessing fluoride intake from beverages did show internal
validity, however, by predicting maternal urinary fluoride levels. This can be seen in the highly significant
correlations that we found ($p < 0.0001$) between maternal urinary fluoride and number of glasses of water
consumed per day and black tea consumption (see Till 2018).

1 studies, and thus inherent to the field. One of the potential confounders for which we lacked data was
2 maternal IQ. We did, however, control for maternal education which is highly correlated with maternal
3 IQ. Moreover, a greater proportion of women living in fluoridated communities (76%) had a university-
4 level degree compared with women living in nonfluoridated communities (66%), and thus it seems
5 unlikely that controlling for maternal IQ would affect our results, particularly since there is no reason to
6 believe that maternal IQ would be correlated with maternal urinary fluoride.

7
8 71. I understand that the EPA has suggested that the location of our study in Canada somehow
9 reduces the relevance of our findings to populations in the US. I disagree. From a biologic standpoint,
10 there is no credible basis to believe that people in the U.S. will respond differently to fluoride than people
11 in Canada. Nor am I aware of any credible reason to conclude, let alone suspect, that people in water-
12 fluoridated areas of the U.S. are exposed to materially less fluoride than people in water-fluoridated cities
13 of Canada.

14 IV. CONCLUSION

15 72. The collective evidence from prospective cohort studies supports the conclusion that
16 fluoride exposure during early brain development diminishes the intellectual abilities in young children,
17 including at the purportedly “optimal” levels of exposure for caries prevention.
18

19
20 I declare under penalty of perjury, under the laws of the United States, that the foregoing is true
21 and correct to the best of my knowledge and belief.

22 Executed on May 20, 2020, in Vancouver, British Columbia, Canada.

**CURRICULUM VITAE OF
BRUCE LANPHEAR, MD, MPH**

CURRICULUM VITAE

Bruce Perrin Lanphear, MD, MPH

Office Address

Blusson Hall
8888 University Drive
Burnaby, BC V5A 1S6
Canada
e-mail: blanchephear@sfu.ca

Marital status: Married to Nancy Ebbesmeyer Lanphear, M.D., a developmental pediatrician

Citizenship: United States of America and Canada (dual citizenship)

Specialty: Board Certified in General Preventive Medicine & Public Health

Employment

1984-1986	Paramedic, Jackson County Jail, Kansas City, Missouri
1988-1989	Physician, International Travel Clinic, University of Cincinnati, Cincinnati, Ohio
1988-1989	Staff Physician, Sexually Transmitted Disease Clinic, Cincinnati Public Health Department, Cincinnati, Ohio
1989-1992	Assistant Professor of Environmental Health, Associate Director, Medical Center Health Services, University of Cincinnati
1992-1997	Senior Instructor, Departments of Pediatrics and of Community & Preventive Medicine, University of Rochester School of Medicine.
1992-1994	National Research Scholar Award in General Pediatric Research, University of Rochester School of Medicine and Dentistry.
1992-1997	Assistant Professor, Department of Pediatrics and of Community & Preventive Medicine, University of Rochester School of Medicine.
1997-2002	Associate Professor, Department of Pediatrics, Children's Hospital Medical Center and the University of Cincinnati, Cincinnati, Ohio.
1997-2008	Director, General Pediatric Research Fellowship Training Program, Children's Hospital Medical Center and the University of Cincinnati.
1997-2008	Director, Children's Environmental Health Center, Children's Hospital Medical Center and the University of Cincinnati.
1997-2006	Associate Professor (Adjunct), Departments of Pediatrics and of Environmental Medicine, University of Rochester School of Medicine & Dentistry, Rochester, NY.
1998-2003	Associate Director for Research, Division of General & Community Pediatrics, Children's Hospital Medical Center.
2001-2002	Associate Professor (tenured), Department of Pediatrics, University of Cincinnati, Cincinnati, Ohio.
2001-2004	Associate Professor (Adjunct), Department of Environmental Health Sciences, University of Michigan School of Public Health, Ann Arbor, Michigan.
2002-2008	Sloan Professor of Children's Environmental Health, Departments of Pediatrics and Environmental Health, University of Cincinnati, Cincinnati Children's Hospital Medical Center, Cincinnati, Ohio.

2008-2012 Adjunct Professor of Pediatrics, Department of Pediatrics, Cincinnati Children's Hospital Medical Center and the University of Cincinnati.
 2008- Professor of Children's Environmental Health, Faculty of Health Sciences, Simon Fraser University
 2008- Clinician Scientist, Child & Family Research Institute, BC Children's Hospital, University of British Columbia

Education

1980-1985 Bachelor of Arts in Biology
 1980-1986 University of Missouri at Kansas City, Medical Degree (1986)
 1986-1987 Internship, University of Arkansas for Medical Sciences, Little Rock, Arkansas
 1987-1988 Tulane School of Public Health & Tropical Medicine
 Masters in Public Health & Tropical Medicine
 1987-1989 General Preventive Medicine and Public Health Residency
 Tulane School of Public Health & Tropical Medicine
 1992-1995 Postdoctoral Fellowship in General Academic Pediatric Research
 University of Rochester School of Medicine, Rochester, NY

Awards and Honors

2011 Sterling Prize in Controversy, Simon Fraser University
 2012 Research Integrity Award, International Society for Environmental Epidemiology
 2013 Public Policy and Advocacy Award, Academic Pediatric Association
 2015 Research Award, Academic Pediatric Association
 2015 Confederation of Union Faculty Associations of British Columbia (CUFA-BC) Academic of the Year Award
 2018 Lumina Award from the Women for Healthy Environmental Health, Pittsburgh, PA

Teaching Experience

1992-1997 Course Instructor, "Public Health & the Environment", Department of Community & Preventive Medicine, The University of Rochester School of Medicine and Dentistry. A required course for MPH students taught annually.
 1997-2008 Founding Director, NIH-funded, General Academic and Community Pediatric Research Fellowship Training Program, Cincinnati Children's Hospital Medical Center. This interdisciplinary, research training program, which included pediatricians, psychologists and epidemiologists, was the first training program in Children's Environmental Health.
 1998-2008 Course Co-Instructor, "Children's Health & the Environment", Department of Environmental Health, The University of Cincinnati School of Medicine. A course taught every other year to MPH, PhD and postdoctoral trainees in medical subspecialties.
 2008- Course Instructor, "Children's Health and the Environment". A 2-week intensive course taught annually to 4th year undergraduate students at Simon Fraser University.
 2011- Course Instructor, "Plagues, Pollutants and Poverty: The Origins and Evolution of Public Health". An undergraduate course at Simon Fraser University.

Committee and Community Involvement

1993-1997 Lead Poisoning Prevention Task Force, Monroe County Health Department.

1994-1997 Investigational Review Board, Rochester General Hospital

1995- Scientific Consultant, National Center for Healthy Housing, Columbia, Maryland.

1996-1997 Member, New York State Task Force on Environmental Neurotoxins, University of Rochester School of Medicine

1996-2001 Member, National Institute for Environmental Health Sciences Grant Review Committee for Community-Based Interventions (FG)

1996-1998 Chairman, U.S. Department of Housing and Urban Development Committee on Lead-Contaminated House Dust

1998 Member, Review Group for National Research Service Awards, Health Resources and Services Administration

1998-2000 Member, Cincinnati Board of Health, Cincinnati, Ohio.

1998-2001 Member, Science and Research Work Group, Office of Children's Health Protection Advisory Committee, U.S. EPA

1998-2000 Member, Cincinnati Lead Poisoning Prevention Advisory Task Force, Cincinnati, Ohio.

1999 Member, K23 Grant Review Committee, National Institute for Environmental Health Sciences, August 1999

1999 Member, Expert Panel on Soil Pica Behavior, Agency for Toxic Substance Disease Registry, June 7th-8th, Atlanta, Georgia

2000 Member, Panel on Health Disparities: Linking Biological and Behavioral Mechanisms with Social and Physical Environments, National Institute for Environmental Health Sciences, July 14-15th

2000-2002 Member, Workshop on Assessing Environmental Exposures to Children, U.S. Environmental Protection Agency, July 26-27th

2000-2004 Member, Children's Environmental Health Project, AAP's Child Health Research Center, Rochester, NY.

2001 Senate Testimony, "Ensuring that Children with Dangerous Levels of Lead in their Blood Receive Care as Early as Possible". Subcommittee on Housing and Transportation of the Committee on Banking, Housing and Urban Affairs, 107th U.S. Congress, November 13th, 2001.

2001 Reviewer, National Research Council, National Academy of Science Update of the 1999 Arsenic in Drinking Water Report

2001-2003 Member, Expert Panel on Children's Health and the Environment, North American Commission for Environmental Cooperation

2002- Member, Scientific Advisory Board, Scientist Communication Network.

2003 Member, "Herculaneum Health Study Workshop" Agency for Toxic Substance Diseases Registry, May 22nd to 23rd, 2003

2003-2004 Panel Member, "Lead Poisoning in Pregnant Women", Mt. Sinai for Children's Health and the Environment, New York, NY

2003 Member, "Invitational Workshop on a proposed American Family Study" National Human Genome Research Institute, December 1st to 3rd, 2003.

2004-2006 Member, Committee on “Ethical Consideration for Research on Housing-Related Health-Hazards involving Children”, National Research Council and the Institute of Medicine, The National Academies

2004 Congressional Testimony, “Tapped Out? Lead in the District of Columbia and the Providing of Safe Drinking Water”, Subcommittee on Environment and Hazardous Materials of the Committee on Energy and Commerce, U.S. House of Representatives, 108th Congress, July 22nd, 2004

2005 Reviewer, “Superfund and Mining Megasites – Lessons from the Couer d’ Alene River Basin”, National Research Council, The National Academies.

2005 Ad Hoc Member, NIEHS Board of Scientific Counselors Review of the Epidemiology Branch, April 3rd to April 5th, 2005

2005 Senate Briefing, “The Connection of Environmental Chemicals and Learning Disabilities”, U.S. Senate, May 10th, 2005

2006 Invited Participant, NIEHS Strategic Planning Forum, National Institute for Environmental Health Sciences, Chapel Hill, North Carolina, October 17-18th, 2006.

2006-2008 Member, U.S. EPA’s Clean Air Scientific Advisory Committee Lead Review Panel.

2006-2008 Member, National Children’s Study Steering Committee, NICHD

2006 Invited Participant, “How Does Housing Affect Health Outcomes of Children?”, MacArthur Foundation, Chicago, Illinois, June 21st-22nd, 2006.

2006- 2010 Member, External Scientific Advisory Committee, Richmond Center for Excellence in Tobacco Research, American Academy of Pediatrics.

2007 Testimony, Vermont State Legislature, “The Lingering Legacy of Lead Toxicity”, Montpelier, Vermont, February 1st, 2007

2007 Testimony, Connecticut State Legislature, “The Legacy of Lead Toxicity”, Hartford, Connecticut, March 14th, 2007. (PG)

2007 Invited Testimony, United States Senate Hearing, “Lead and Children’s Health”. Committee on Environmental and Public Works, October 18th, 2007

2007-2008 Member, Committee on “Committee on Contaminated Drinking Water at Camp Lejeune”, National Research Council, The National Academies.

2008 Member, Expert Panel on Health and the Environment, Statistics Canada, Ottawa,

2008- Member, Alliance for the Global Elimination of Lead Paint, Intergovernmental Forum on Chemical Safety (IFCS), World Health Organization

2008-2009 Reviewer, Toxicological Review and Recommended Toxicological Reference Values for Environmental Lead Exposure in Canada, Health Canada

2009-2013 Scientific Advisor, Canada Lead Study funded by Health Canada (Patrick Levallois, Principal Investigator).

2009-2014 Board Member, Barro Sin Plomo

2009-2010 Member, Health and Environment Experts Advisory Group of the Canadian Longitudinal Study on Aging, Canadian Institutes of Health Research

2010-2012 Member, US Environmental Protection Agency Science Advisory Board for Evaluating Dust Lead Standards

2010-2013 Advisor, Canada Environmental Health Law and Canadian Partnership for Children’s Health and Environment Retrofit Project

2010-2012 Member, Physicians Advisory Panel, Canada Health Measures Survey

2010 Invited Testimony, United States Senate Hearing, “Research on Environmental Health Factors with Autism and Neurodevelopmental Disorders”, August 3rd, 2010

2010 Member, Joint FAO/WHO Expert Panel for Toxicological and Health Review of Bisphenol A

2010-2015 Board Member, Global Community Monitoring, Oakland, California

2010- Chairman, Scientific Advisory Committee for Dartmouth University’s Program in Children’s Health and the Environment

2011-2016	Member, American Academy of Pediatrics Executive Council on Environmental Health
2011-2012	Member, US Environmental Protection Agency Science Advisory Board for Evaluating Hazards of Partial Water Line Replacement
2011	Invited Testimony, Special Committee on Cosmetic Pesticides, Legislative Assembly, Province of British Columbia, October 7 th , 2011
2011-2012	Member, Panel on Health Effects of Low-level Lead, Office of Health Effects, National Toxicology Program of the National Institutes of Environmental Health Sciences,
2012-	Member, Expert Advisory Committee, Canada Health Measures Survey
2012-	Member, Environmental Defence Fund Science Advisory Committee on Toxics
2015	Reviewer, Review of Clinical Guidance for the Care of Health Conditions Identified by the Camp Lejeune Legislation, Institute of Medicine, The National Academies
2016-	Member, The Lancet Commission on Pollution, Health & Development
2016-	Member, Targeting Environmental Neuro-Developmental Risks (TENDR)
2016	Member, Steering Committee, The National Lead Summit, United States
2017	Rockefeller Foundation Academic Writing Retreat, Bellagio, Italy
2017-	Member, Advisory Committee for the Flint (MI) Cohort Study
2017-	Pure Earth Leadership Council
2018-	Member Project TENDR Advisory Board
2018-	Member, Mercury Disability Board Committee, Health Canada

Editorial Boards

2000-2015	Assistant Editor, <i>Environmental Research</i>
2000-2008	Deputy Editor, <i>Public Health Reports</i>
2004	Associate Editor, <i>Pediatrics</i> supplement on Children's Environmental Health
2004-2017	Editorial Board Member, <i>PLoS Medicine</i>
2005-2014	Editorial Board Member, <i>Breastfeeding Medicine</i>
2007-	Editorial Board Member, <i>Environmental Health</i>
2008-2012	Editorial Review Board Member, <i>Environmental Health Perspectives</i>
2012-2015	Associate Editor, <i>Environmental Health Perspectives</i>
2016-	Advisor, <i>Environmental Health Perspectives</i> News Section

Societies and Organizations

1989-2008	American Public Health Association
1996-2015	Academic Pediatric Association
1997-2012	American Association for the Advancement of Science
2000-2008	Society for Pediatric Research
2001-2008	American Pediatric Society
2001-2016	Specialty Fellow, American Academy of Pediatrics
2006-	Fellow, Collegium Ramazzini
2006-	Member, International Society for Environmental Epidemiology
2008-	Founding Member, International Society for Children's Health & the Environment
2011-2017	Secretary and Treasurer, International Society for Children's Health & the Environment
2012-	Member, International Society for Exposure Science
2017-2018	Vice-President, International Society for Children's Health & the Environment
2019-2020	President, International Society for Children's Health & the Environment

23. "Primary Prevention of Childhood Lead Exposure: A Randomized Trial of Dust Control". American Public Health Association, Indianapolis, November 13, 1997.
24. "Evolution of a Disease: Prevention of Childhood Lead Exposure." Pediatric Grand Rounds, Medical University of South Carolina, Charleston, SC, March 20, 1998.
25. "The Science of Childhood Lead Exposure Prevention." Tulane/Xavier Center for Bioenvironmental Research, New Orleans, May 4-5th, 1998.
26. "Lead Hazard Control Research" Conference on Linking Health, Housing & Environment, Centers for Disease Control, Department of Housing and Urban Development, National Institutes of Health, Phoenix, Arizona, June 21-24, 1998.
27. "A Randomized Trial of Dust Control to Prevent Childhood Lead Exposure." Presenter and Co-chairman, Section on Heavy Metals, 1st International Conference on Children's Environmental Health, Amsterdam, The Netherlands, August 11-13th, 1998.
28. "Prevention of Childhood Lead Exposure: A Critique of the EPA's Proposed Residential Lead Standard". Office of Children's Health Protection, U.S. Environmental Protection Agency, Washington, D.C., November 5, 1998.
29. "Science and Policy of Lead Poisoning Prevention in the United States". Nicholas School of the Environment, Duke University, Durham, North Carolina, February 22, 1999.
30. "Behaviors in Early Childhood and Exposure to Environmental Toxins". (invited) Pediatric Environmental Health Conference, San Francisco, CA May 4, 1999.
31. "Patterns of Lead Exposure in Early Childhood". International Conference on Lead Exposure, Reproductive Toxicity and Carcinogenicity, Gargnano, Italy, May 7, 1999.
32. "Adverse Effects of Blood Lead Concentrations <10 µg/dL" (Invited), 17th International Conference Neurotoxicology Conference, Little Rock, Arkansas, October 17-20, 1999.
33. "Emerging Research and Implications for Prevention of Childhood Lead Exposure" (Invited), 2nd Annual Syracuse Lead Conference, Syracuse, New York October 27th, 1999.
34. "Prevention of Lead Poisoning in Children" Sierra Club, Omaha, NE, November 16th, 1999.
35. "Children's Environmental Health: A Focus on Residential Hazards" Department of Pediatrics, University of Nebraska Hospital, November 17th, 1999.
36. "Effectiveness of Lead Hazard Controls", New England Lead Conference, New Hampshire, Tufts University School of Medicine, April 25, 2000.

37. "Subclinical Lead Toxicity in U.S. Children and Adolescents", Pediatric Academic Societies, Boston, MA, May 15, 2000.
38. "Contribution of Residential Exposures to Asthma in U.S. Children and Adolescents", Pediatric Academic Societies, Boston, MA, May 16, 2000.
39. "The Effect of Soil Abatement on Blood Lead Concentration in Children living near a former Smelter and Milling Operation" (invited). Coeur d'Alene, Idaho, May 24, 2000.
40. "The Paradox of Lead Poisoning Prevention" (invited). National Institute of Justice, Washington, D.C., July 18th, 2000.
41. "Evolution of a Disease: Prevention of Childhood Lead Exposure." Pediatric Grand Rounds, Children's Hospital Medical Center, Cincinnati, Ohio, August 22, 2000.
42. "Children's Environmental Health: A Focus on Residential Hazards" Pediatric Grand Rounds, Department of Pediatrics, University of Rochester School of Medicine, Rochester, NY, September 20th, 2000.
43. "Prevention of Lead Poisoning in Childhood" 7th Annual Childhood New York State Lead Poisoning Prevention Conference, Purchase College, NY, September 29, 2000.
44. "Excavating the Enigmas of Childhood Lead Exposure". Department of Environmental and Occupational Medicine, Harvard University School of Public Health, Boston, MA, October 16th, 2000.
45. "Contribution of Residential Exposures to Asthma". Eliminating Childhood Lead Poisoning: Our Challenge for the Decade, Centers for Disease Control and the U.S. Department of Housing & Urban Development, December 11th, 2000.
46. "Setting Research Priorities for the Decade". (Moderator & Speaker) Eliminating Childhood Lead Poisoning: Our Challenge for the Decade, Centers for Disease Control and the U.S. Department of Housing & Urban Development, December 13th, 2000.
47. "Evolution of a Disease: Prevention of Childhood Lead Exposure." (Keynote Presentation) Look Out for Lead Conference, Madison, WI, April 12, 2001.
48. "Environmental Lead Exposure and Children's Intelligence at Blood Lead Concentrations below 10 µg/dl." APA Presidential Plenary Session, Pediatric Academic Society Meeting, Baltimore, MD, April 30, 2001.
49. "Elimination of Childhood Lead Exposure: Obstacles & Opportunities" (Plenary). National Housing Conference and Exposition, New Orleans, LA, May 16th, 2001.
50. "Prevention of Childhood Lead Exposure: A Public Health Perspective" (Keynote Presentation). Philadelphia Health Department, Philadelphia, PA, May 23rd, 2001.

51. "Evolution of a Disease: Prevention of Childhood Lead Exposure." (Keynote Presentation), Charles Drew University, Los Angeles, California, October 22nd, 2001.
52. "Primary Prevention of Childhood Lead Exposure" (Keynote Presentation), Midwest Regional Lead Conference, Pittsburgh PA, October 29th, 2001.
53. "Prevention of Childhood Lead Exposure: Shifting to Primary Prevention" (Keynote Presentation), Indiana Department of Health, Lead-Safe Conference, November 7th, 2001.
54. "A Strategy for Primary Prevention of Childhood Lead Exposure" A testimony to Housing and Transportation Subcommittee, U.S. Senate, Washington, D.C., November 13, 2001.
55. "Ethical issues of Environmental Research involving Children" (moderator and speaker). Panelists were Jeffrey Kahn, Ph.D., and Leonard Glantz, J.D., Raleigh-Durham, North Carolina, NIEHS Conference of Children's Environmental Health Centers, January 23, 2001.
56. "Evolution of a Disease: Science and Prevention of Childhood Lead Exposure." Grand Rounds, Omaha Children's Hospital, Omaha, Nebraska, March 1, 2002.
57. "Racial Disparities in Children due to Environmental Hazards" Ohio Commission on Minority Health, Columbus, Ohio March 27, 2002.
58. "Prevention of Childhood Lead Exposure in a Former Mining Community" Tar Creek, Oklahoma, April 4, 2002.
59. "Evolution of a Disease: Science and Prevention of Childhood Lead Exposure." Grand Rounds, Hasbro Children's Hospital, Brown University, Providence Rhode Island, May 17, 2002.
60. "Evolution of a Disease: Science and Prevention of Childhood Lead Exposure." Grand Rounds, Dayton Children's Hospital, Wright University, Dayton, Ohio May 22, 2002.
61. "Evolution of a Disease: Science and Prevention of Childhood Lead Exposure." International Lead Congress, Washington, DC, June 3rd, 2002.
62. "Residential Hazards: A Neglected Health Problem" Agency for Toxic Substances Disease Registry, Centers for Disease Control and Prevention, Atlanta, Georgia, August 19th, 2002.
63. "Control of Residential Exposures to Environmental Neurotoxins" National Center for Healthy Homes (Moderator and Speaker), Annapolis, VA, November 7th, 2003.
64. "The Promises and Potential Pitfalls of Primary Lead Poisoning Prevention" Purchase College, 9th Annual Childhood New York State Lead Poisoning Prevention Conference, Purchase College, New York,, October 4th, 2002.
65. "Evolution of a Disease: the Science and Prevention of Childhood Lead Exposure." Pediatric Grand Rounds, Syracuse, NY, October 9th, 2002.
66. "Evolution of a Disease: the Science and Prevention of Childhood Lead Exposure." University of Texas at El Paso, El Paso, Texas January 29th, 2003.

67. "Childhood Lead Poisoning" Introduction to Children's Environmental Health, Seattle, Washington, Pediatric Academic Society, May 3rd, 2003.
68. "The Legacy of Lead: Childhood Lead Poisoning in the 21st Century". Chicago Lead Summit, Chicago, Illinois, May 28th, 2003.
69. "The Legacy of Lead: Childhood Lead Poisoning in the 21st Century". Case Western Reserve University, Cleveland, Ohio, June 3rd, 2003.
70. "Housing and Children's Health", Sprawl: The impact on vulnerable populations, University of Cincinnati College of Medicine, Cincinnati, Ohio, July 8th, 2003.
71. "Trials and Tribulations of Protecting Children from Environmental Toxins". Duke University, Nicholas School of the Environment, Durham, NC, November 6th, 2003.
72. "Adverse Effects of Fetal and Childhood Exposures to Prevalent Toxins" Midwest Critical Regional Neonatology Conference, Covington, KY, November 14th, 2003.
73. "Control of Residential Hazards in Children" American Public Health Association, San Francisco, CA, November 18th, 2003.
74. "Low-Level Exposure to Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis". 21st International Neurotoxicology Conference, Honolulu, Hawaii, February 11th, 2004.
75. "Trials and Tribulations of Protecting Children from Environmental Hazards" Workshop on Ethical Issues on Children's Environmental Health, Children's Environmental Health Network, Washington, D.C. March 5, 2004.
76. "Low-Level Exposure to Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis", Pediatric Academic Societies Annual Meeting. Pediatric Research 2004;55:163A.
77. "The Impact of the Environment on Children's Health" Bob Smith Endowed Lecture, Department of Pediatrics, First Gulf Coast Children's Environmental Health Symposium, Baylor University, Houston, Texas.
78. "The Search for Environmental Causes of Learning Disabilities, Learning Disabilities Initiative, Baltimore, MD, May 18th, 2004.
79. "Residential Hazards in Children: A Neglected Public Health Problem", Pediatric Grand Rounds, Boston Medical Center, Department of Pediatrics, Boston University Medical Center, Boston, MA, May 20th, 2004.
80. "Residential Hazards in Children" "Healthier Homes, Stronger Families: Public Policy Approaches to Healthy Housing", National Center for Healthy Housing, Washington, D.C., June 2nd, 2004.

81. "Fetal and Early Childhood Exposures to Prevalent Toxins" Pediatric Grand Rounds, Ste. Justine Children's Hospital, University of Montréal, Montreal, Canada, June 16th, 2004.
82. "Childhood Exposure to Lead-Contaminated Soil: A Problem of the Past or a Problem from the Past?" National Academy of Science Committee on Superfund Site Assessment and Remediation in Coeur d'Alene River Basin", June 17th, 2004, Coeur d'Alene, Idaho.
83. "The Legacy of Lead" (Keynote Speaker). Chicago Lead Summit, Region V EPA Headquarters, September 15th, 2004.
84. "A Tale of Two Toxins: Children's Exposure to Tobacco and Lead" (with Michael Weitzman), The American Academy of Pediatrics, San Francisco, CA, October 10th, 2004.
85. "A Legacy of Childhood Lead Poisoning" University of Washington, Seattle, Washington, October 30, 2004.
86. "Protecting Children from Environmental Toxins", Pediatric Grand Rounds, Seattle Children's Hospital, Seattle Washington, March 10th, 2005.
87. "The Science and Politics of Childhood Lead Poisoning", Northwest Pediatric Environmental Health Conference, University of Washington, Seattle, Washington, March 11th, 2005.
88. "The Effects of Low-level Exposure to Environmental Toxins during Fetal Development and Early Childhood", Children's' Hospital of Fudan University, Shanghai International Pediatric Forum, Shanghai, China, June 16th to 18th, 2005.
89. "The Role of Biomarkers in Revealing Genetic and Environmental Influences of Disease and Disability" Psychiatry Grand Rounds, University of Cincinnati, February 8th, 2006.
90. "Trials and Tribulations of Protecting Children from Environmental Hazards: Ethical Issues", Johns Hopkins University of Medicine, March 17th, 2006.
91. "Key Elements of a Primary Prevention Strategy for Lead Poisoning", Albany Law School, Union University, Albany, New York, March 16th, 2006.
92. "Low-Level Lead Toxicity: The Ongoing Search for a Threshold", Case Western Reserve University, City Club of Cleveland, Cleveland, OH March 4th, 2006.
93. Integrating Genetic and Environmental Influences in Pediatric Research" (Moderator and Speaker), Pediatric Academic Societies, San Francisco, CA, April 30th 2006.

94. "Ethical Issues in Housing Health Hazard Research Involving Children" (Topic Symposia) Pediatric Academic Societies, San Francisco, CA, May 2nd 2006.
95. "Low-Level Lead Toxicity: The Ongoing Search for a Threshold", International Workshop on Neurotoxic metals: from Research to Prevention, University of Brescia, Italy, June 17th, 2006.
96. "Efficacy of HEPA-CPZ Air Cleaners on Unscheduled Asthma Visits and Asthma Symptoms", International Society for Environmental Epidemiology, Paris France, September 6th, 2006.
97. "Protecting Children from Environmental Toxins", Region VIII Children's Environmental Health Summit, Vail, Colorado September 20th, 2006.
98. "Integrating Genetic and Environmental Biomarkers in Pediatric Epidemiology", Visiting Professor, Simon Fraser University and University of British Columbia, Vancouver, British Columbia, October 19th-20th, 2006.
99. "The Legacy of Lead", Indiana Lead Conference, Indianapolis, Indiana, October 24, 2006.
100. "Ethical dilemmas in Children's Environmental Health", Seminar Series in Ethics of Toxicology, University of Champagne-Urbana, Champagne, Illinois, November 19th, 2006.
101. "Low-Level Lead Toxicity: Implications for Prevention", WHO Informal Workshop on Lead, University of Munich, Germany, November 30th, 2006.
102. "Low-Level Lead Toxicity: The Ongoing Search for a Threshold", National Environmental Public Health Conference, National Centers for Disease Control, Atlanta, Georgia, December 4th, 2006.
103. "The Epidemiologic Conquest of Childhood Lead Toxicity: A Pyrrhic Victory". NIEHS Workshop on Children's Environmental Health Research: Past, Present and Future. January 22nd, 2007.
104. "Linking Low-level Exposures to Environmental Toxicants with ADHD". Duke Integrated Toxicology and Environmental Health Program Symposium on Developmental Neurobehavioral Disabilities and Toxic Exposures, March 23, 2007, Durham, North Carolina.
105. "Using Biomarkers to Link Environmental Influences with Disease and Disability", The Channing Laboratory, Harvard University, Boston, Massachusetts, April 4th, 2007.
106. "The Lingering Legacy of Lead Toxicity". Grand Rounds, Department of Pediatrics, St. Louis Children's Hospital, St. Louis University, St. Louis, Missouri, April 11th, 2007.
107. "Protecting Children from Environmental Toxicants", United States Council of Catholic Bishops, Washington, D.C., April 30th, 2007.
108. "Efficacy of HEPA-CPZ Air Cleaners on Unscheduled Asthma Visits and Asthma Symptoms", Pediatric Academic Societies, APA Presidential Platform Plenary Session, Toronto, Canada, May 7th, 2007.

109. "The Lingering Legacy of Lead Toxicity" Grand Rounds, Department of Pediatrics, Omaha Children's Hospital, University of Nebraska, Omaha, Nebraska, April 11th, 2007.
110. "Linking Low-level Neurotoxicant Exposures of the Developing Brain to Learning and Behavioral Problems." International Conference on Developmental Programming and Effects of Environmental Toxicants in Human Health and Disease, Faroe Islands, May 20th, 2007.
111. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson", National Policy Consultation Series on Children's Health and Environment, Moncton, New Brunswick, Canada, May 31, 2007.
112. "Low-Level Toxicity of Environmental Toxicants: Much Ado about Nothing?" Occupational and Environmental Health Seminar Series, Health Canada, Ottawa, Canada, June 6th, 2007.
113. "Linking Low-Level Lead Exposure with Child and Adolescent Psychopathology", 13th Annual International Society for Research in Child and Adolescent Psychopathology, London, England, June 19th, 2007.
114. "The Legacy of Lead Toxicity". Pediatric Grand Rounds, New York Presbyterian Hospital-Weill Cornell Medical Center, September 18th, 2007.
115. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson". Pediatric Grand Rounds, Children's Hospital at Dartmouth, Dartmouth Medical School, September 19th, 2007.
116. "The Legacy of Lead Toxicity: Effects of Childhood Lead Exposure in Children, Adolescents and Adults". Mid-America Conference, Philadelphia, Pennsylvania, October 4th, 2007.
117. "Low-Level Toxicity of Environmental Toxicants: Much Ado about Nothing?" International Society for Exposure Analysis (invited plenary session), Raleigh-Durham, North Carolina, October 17th, 2007.
118. The Global Elimination of Lead Toxicity: A Focus on Housing." National Institute of Public Health, Rennes, France, October 22nd, 2007.
119. Linkage of Environmental Lead Exposure with Psychopathology in Children and Adolescents" Ramazzini Collegium, Carpi, Italy, October 25th, 2007.
120. "Linking Exposures to Environmental Toxicants with Child and Adolescent Psychopathology", Symposium on Environmental Toxicity and the Brain, University of Toronto, Toronto, Canada, December 7th, 2007.
121. "Linking Exposures to Environmental Toxicants with Child and Adolescent Psychopathology." Pediatric Grand Rounds, Rochester General Hospital and Strong Memorial Hospital, Rochester, New York, April 1&2, 2008.

122. "Rochester's Role in the Ongoing Elimination of Childhood Lead Toxicity." Beaven Lecture, Rochester Academy of Medicine, Rochester, New York, April 1, 2008.
123. "The Lingering Legacy of Lead Toxicity: Lansing Legacy." Michigan's Conference for Lead Safe & Healthy Homes, East Lansing, MI, April 22, 2008.
124. First Annual Controversies in Pediatric Environmental Health, "Should the Centers for Disease Control Lower the Blood Lead Level of Concern". A debate by Bruce Lanphear and George G. Rhoads (James Sargent, Moderator). Pediatric Academic Societies Meeting, Honolulu, Hawaii, May 2nd, 2008.
125. "Linking Exposure to Environmental Toxicants with Psychopathology in Children and Youth". Visiting Professor, Alberta Child and Youth Network, Calgary Children's Hospital, Calgary, Alberta. May 13th-15th, 2008.
126. "Lead Toxicity and the Teenage Brain", Youth Exploring Science Program, St. Louis Science Center, St. Louis, Missouri, June 30th, 2008.
127. "The Legacy of Childhood Lead Toxicity". Health Canada, Ottawa, Canada, October 6th, 2008.
128. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson". The 2008 Rachel Carson Legacy Conference: Green Chemistry – Solutions for a Healthy Economy, Duquesne University, Pittsburgh, Pennsylvania, September 20th, 2008.
129. "Trials and Tribulations of Protecting Children from Environmental Hazards", Ethics in Toxicology Seminar Series, University of Champagne-Urbana, Champagne, Illinois, September 22nd, 2008.
130. "Industry's Influence on the Prevention of Childhood Lead Poisoning." In: Symposia on Insulating Environmental Health Research from Conflicting Interests. International Society for Environmental Epidemiology Annual Meeting, Pasadena, California, October 14th, 2008.
131. "The Lingering Legacy of Lead Toxicity: Implications for Research and Policy on Other Environmental Toxicants". (Keynote Presentation) BC Environmental and Occupational Health Research Network, Vancouver, BC, November 7th, 2008.
132. "Effects of Environmental Toxicants on Children's Development". DB-PREP Course, American Academy of Pediatrics, Atlanta, Georgia, December 5th, 2008.
133. "Linking Low-level Environmental Toxicants with New Morbidities of Childhood". BC Children's Grand Rounds, British Columbia, Vancouver, February 6th, 2009.
134. "Using Biomarkers to Link Exposures with Disease and Disability in Children". Workshop on Physical and Chemical Exposures in Canadian Cohort Studies, Canadian Institute of Health Research and Health Canada, February 8th-9th, 2009.

135. "How Dangerous Is Lead In Drinking Water?" An interview on "Around The Water Cooler" with Werner Troesken and Bruce Lanphear. February 18th, 2009.
136. "Linking Environmental Toxicants with ADHD in Children" (invited), Learning Disabilities Association Annual Meeting, February 25th, Salt Lake City, Utah.
137. "The Lingering Legacy of Lead Toxicity", Norfolk Children's Hospital, April 30th, 2009, Norfolk Virginia.
138. Second Annual Controversies in Pediatric Environmental Health Debate, "Should Pediatricians Advise Parents to Feed their Children Organic Foods?" A debate by Joel Forman and Janet Silverstein (Bruce Lanphear, Moderator and Organizer). Pediatric Academic Societies Meeting, Baltimore, MD, May 4th, 2009.
139. "A Pattern of Pathology: The Population Impact of Environmental Toxicants on Health". Workshop on Endocrine Disruptors, Endocrine Society, Washington, DC, June 9th, 2009.
140. "The Quandary of Environmental Contaminants in Human Milk", 25th Anniversary of US Surgeon General's Report on Breastfeeding, Washington, DC, June 13th, 2009.
141. "Linking Exposures to Environmental Toxicants with Learning Problems and Psychopathology in Children." Northwest Conference on Children's Health and Environment, Tukwila, Washington, October 1st, 2009.
142. "The Second Coming of the Sanitarians", Pediatric Grand Rounds, University of California at Davis Children's Hospital, Sacramento, California, October 9th, 2009.
143. "The Second Coming of the Sanitarians", National Institute of Public Health, Rennes, France, November 4th, 2009.
144. "Linking Exposure to Environmental Toxicants with ADHD in Children." Symposium on ADHD. Riyadh, Saudi Arabia, November 7th, 2009.
145. "The Interplay of Genetic and Environmental Influences in Common Conditions of Children." Macquarie University, Department of Geology, Sydney, Australia, November 18th, 2009.
146. "The Lingering Legacy of Lead Toxicity: A Call for the Global Elimination of Lead Exposure." Pacific Basin Consortium Symposium on Environment and Health, Perth, Australia, November 13th, 2009.
147. "The Second Coming of the Sanitarians", SFU President's Lecture, Simon Fraser University, Burnaby, BC, March 4th, 2010.
148. Third Annual Controversies in Pediatric Environmental Health Debate, "Should the American Academy of Pediatrics Sponsor a Ratings Board to Provide Evidence-based Ratings for Media?" A debate by James Sargent and Donald Shifrin (Bruce Lanphear, Moderator and Organizer). Pediatric Academic Societies Meeting, Vancouver, BC, May 2nd, 2010.

149. "Efficacy of Reducing Lead Hazards in Housing on Lead-Contaminated House Dust, Blood Lead Concentration and Intellectual Abilities in Children." Pediatric Academic Societies Meeting, Vancouver, BC May 1st, 2010.
150. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson." Pediatric Grand Rounds, Cornell Weill Medical College, New York, New York. May 25th, 2010.
151. "Excavating the Enigmas of Childhood Lead Toxicity", Guest Lecturer, "Introduction to Toxicology, Harvard School of Public Health, Boston, Massachusetts, October 27th, 2010.
152. "The Conquest of Lead Poisoning: A Pyrrhic Victory", Lead Action Collaborative, New England Carpenters Center, Boston, Massachusetts, October 28th, 2010.
153. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson." Academy of Breastfeeding Medicine, San Francisco, California, October 29th, 2010.
154. "Bisphenol A and Behavior Problems in Children". Eastern Perinatal Conference, Kingston, Ontario, November 10th, 2010.
155. "Low-Level Toxicity of Environmental Toxicants: Much Ado about Nothing?" UBC Statistics Department Seminar, November 18th, 2010.
156. "Protecting Children from Environmental Toxicants." Children's Hospital of Quebec, University of Laval, Quebec City, Quebec, December 17th, 2010.
157. "Low-level Toxicity: Implications for Research and Policy", Joint Talks by C. Arden Pope and Bruce Lanphear, SFU, UBC and UW Annual Occupational and Environmental Health Conference, Semiahmoo, WA January 7th, 2011.
158. "Crime of the Century: Lead Toxicity in the 20th Century", Panel Presentation and Discussion, UC Davis, Sacramento, California April 7th, 2011.
159. Fourth Annual Controversies in Pediatric Environmental Health Debate, "Should Parent Slather their Children with Sunscreen?" A debate with Russell Chesney, MD and Sophie Balk, MD, (Bruce Lanphear, Moderator and Organizer). Pediatric Academic Societies Meeting, Denver, Colorado, May 1st, 2011.
160. "The Conquest of Lead Toxicity: A Pyrrhic Victory", Canadian Water Network, Ecole Polytechnique de Montreal, Montreal, Canada, June 9th, 2011.
161. "The Contribution of Environmental Influences on Chronic Disease, Canadian Partnership for Health and Environment, Toronto, Canada, June 16th, 2011.
162. "The Second Coming of the Sanitarians", Environmental and Occupational Health Seminar, University of Washington School of Public Health, Seattle, WA, May 12th, 2011.
163. "Crime of the Century: The Failure to Prevent the Lead Pandemic". Sterling Prize in Controversy, Wosk Centre, Simon Fraser University, Vancouver, BC, October 19th, 2011.

164. "Measuring Exposure: The Benefits and Limits of Biomarkers". Canadian Institute for Human Development, Child and Youth Research, Montreal, Canada, December 6th, 2011.
165. "Rachel Carson: Clarity of Vision". SFU, UBC and UW Annual Occupational and Environmental Health Conference, Semiahmoo, WA, January 6th, 2012.
166. "The Truth About Toxins: What Parents and Health Professionals Should Know". Environmental Influences on Neurodevelopment: Translating the Emerging Science into Public Health Policy". UCLA School of Public Health, Los Angeles, California, January 12th, 2012.
167. "Protecting Children from Environmental Toxicants: The Neglected Legacy of Rachel Carson". Mattel Children's Hospital, Los Angeles, California, January 13th, 2012.
168. "Why Should We Share Data?", Data Sharing Strategies for Environmental Health Workshop, National Institute of Environmental Health Sciences, Research Triangle Park, North Carolina, February 6th and 7th, 2012.
169. "The Science and Prevention of Lead Toxicity" (Keynote Presentation), Forum on Lead Toxicity: A Little is Still Too Much", Macquarie University, Sydney, Australia, June 5th, 2012
170. "Canada Environmental Health Atlas Knowledge Translation Workshop", Canadian Public Health Association, Edmonton, Alberta, June 13th, 2012.
171. "First Annual Controversies in Pediatric Environmental Health Debate: Should organophosphate pesticides be reduced or banned?" A debate with Brenda Eskenazi and Bruce Lanphear (Rob McConnell, Moderator). International Society for Environmental Epidemiology, Columbia, SC, August 28th, 2012.
172. "Supralinear Dose-Response Relationship of Environmental Toxicants: Research and Policy Implications." Moderator and Speaker, with Arden Pope, Roel Vermeulen and Bruce Lanphear. International Society for Environmental Epidemiology, Columbia, SC, August 29th, 2012.
173. Tanya Froehlich and Bruce Lanphear, "ADHD and Environmental Toxicants: Time for Prevention?", Society for Development and Behavioral Pediatrics, Phoenix, AZ, September 9th, 2012.
174. "The Epidemic of Childhood Disabilities: A Failure to Regulate". Workshop on Children's Rights and Corporate Responsibility, Green College, University of British Columbia, Vancouver, BC, October 19th, 2012.
175. "Low-level Toxicity: Much Ado About Nothing?", Department of Preventive Medicine Seminar, University of Southern , California, Los Angeles, California, October 23rd, 2012.
176. "Reflections on Silent Spring". (Invited Keynote). International Society for Exposure Sciences, Seattle, Washington, October 28th, 2012.

177. "Randomized Controlled Trials in Children's Environmental Health: Underutilized or Unethical?" The University of Washington Northwest Pediatric Environmental Health Specialty Unit and Center for Child Environmental Health, Seattle, Washington, February 26th, 2013.
178. "Crime of the Century: Our Failure to Prevent the Lead Pandemic". Dali Lana School of Public Health and of School Environment, University of Toronto, Toronto, Ontario, March 26th, 2013.
179. "The Ongoing Search for a Threshold". International Conference of Toxicology, Seoul, Korea, July 1, 2013.
180. "Blood Lead Concentrations and Cardiovascular Mortality in the United States: The NHANES Mortality Follow-up Cohort Study". International Society for Environmental Epidemiology, Basel, Switzerland, August 2, 2013.
181. "The Conquest of Lead Poisoning: A Pyrrhic Victory". Corporations and Global Health Governance. Simon Fraser University, Burnaby, British Columbia. September 17th, 2013.
182. "Striking at the Root: Changing the Narrative on the Causes of Disease". Corporations and Global Health Governance. Simon Fraser University, Burnaby, British Columbia. September 17th, 2013.
183. "Crime of the Century: The Failure to Prevent the Lead Pandemic". Pacific Basin Consortium, East-West Center, Honolulu, Hawaii. September 26, 2013.
184. "Low-level Toxicity: Policy Implications for the 21st Century". Symposium on Policy Implications of Environmental Exposures in the 21st Century. Pacific Basin Consortium, East-West Center, Honolulu, Hawaii. September 27, 2013.
185. "Excavating the Enigmas of Childhood Lead Toxicity". Network for Soil Contamination Research (INSCR), Delhi University, New Delhi, India. October 22nd, 2013.
186. "The Lingering Legacy of Lead Toxicity: A Call for the Global Elimination of Lead Exposure", World Health Organization, New Delhi, India. October 24th, 2013. "The Environmental Health Atlas: A Portal to Discover the Promises of Environmental Health." National Institute of Environmental Health Sciences, Raleigh-Durham, NC, November 10th, 2013.
187. "Protecting Children from Environmental Toxins". Japan Dioxin and Endocrine Disruptors Preventive Action, Tokyo, Japan, November 24th, 2013.
188. "ADHD: A Preventable Epidemic?" Alberta Children's Hospital, Calgary, Alberta, December 16th, 2013.
189. "Little Things Matter: The Impact of Toxins on the Developing Brain". Early Years Conference, Vancouver, British Columbia, January 30th, 2014.
190. "Little Things Matter: The Impact of Toxins on the Developing Brain". Dalhousie University, Halifax, Nova Scotia, March 6th, 2014.

191. "Low-level Toxicity of Environmental Toxins: Much Ado About Nothing?". Dalhousie University, Halifax, Nova Scotia, March 6th, 2014.
192. "The Canadian Environmental Health Atlas: A Portal to Discover the Promises of Environmental Health." School of Occupational and Environmental Health, University of British Columbia, March 28th, 2014.
193. "Little Things Matter: The Impact of Toxins on the Developing Brain". British Columbia Healthy Child Alliance, Vancouver, British Columbia, April 2nd, 2014.
194. "Sixth Annual Controversies in Pediatric Environmental Health Debate, E-Cigarettes: A weapon in the war against tobacco or a threat to tobacco control. (Moderator). Featuring Greg Connelly and James Sargent. Pediatric Academic Societies, Vancouver, May 4th, 2014.
195. "Striking at the Root Causes of Chronic Disease in Children" (Moderator). James Sargent, Joel Bakan and David Kessler, May 5th, 2014.
196. "Little Things Matter: The Impact of Toxins on the Developing Brain" (Keynote). OHKA Healthy Homes Alliance, Omaha, Nebraska, May 15th, 2014.
197. "Excavating environmental risk factors for autism: Suspects and strategies". A workshop on examining a multi-systems approach to autism and the environment: challenges and opportunities for research". Toronto, Ontario, June 23rd-24th, 2014.
198. "Lead Poisoning: Tackling a Global Problem" (Co-Moderator and Speaker). International Society for Environmental Epidemiology, Seattle, Washington, August 25th, 2014.
199. "Interventions to Reduce Exposures to Environmental Hazards in Pregnant Women and Children", (Moderator and Speaker). International Society for Environmental Epidemiology, Seattle, Washington, August 25th, 2014.
200. 3rd Annual ISCHE-Sponsored Debate: Should there be any restrictions on universities or academicians receiving payment from industry or other sources? (Moderator). International Society for Environmental Epidemiology, Seattle, Washington, August 25th, 2014.
201. "Crime of the Century: Our Failure to Prevent the Lead Pandemic", Tulane University School of Public Health and Tropical Medicine, New Orleans, Louisiana, September 5th, 2014.
202. "Environment Matters", Children's Environmental Health Panel. Society for Environmental Journalists, New Orleans, Louisiana, September 6th, 2014.
203. "Insidious Influence of Industry on Science: How Corporations Undermine Science", 5th Annual C. Everett Koop Distinguished Lecture, "Corporate Threats to Children's Health", with Joel Bakan and James Sargent, Dartmouth University, New Hampshire, October 6th, 2014.
204. "Crime of the Century: Our Failure to Prevent the Lead Pandemic", John Rosen Memorial Lecture, Montefiore Medical Center, New York, New York, October 8th, 2014.

205. "Little Things Matter: The Impact of Toxins on the Developing Brain" (Keynote). Prenatal Environmental Health Education (PEHE) Conference, University of Ottawa. Ottawa, Ontario, November 21st, 2014.
206. "Little Things Matter: The Impact of Toxins on the Developing Brain" (Keynote). ISEE Asian Regional Meeting, Shanghai, China, November 30th, 2014.
207. "Crime of the Century: Our Failure to Prevent the Lead Pandemic", John Rosen Memorial Lecture, ISEE Asian Regional Meeting, Shanghai, China, November 31st, 2014.
208. "Data Visualization", with Joe Braun and Allan Just, Pediatric Environmental Health Scholars Retreat, Reston, VA, December 6th, 2014.
209. "Victories in Public Health: Progress or Adaptation?" SFU, UBC and UW Annual Occupational and Environmental Health Conference, Semiahmoo, WA January 8th, 2015.
210. "Food in the Industrial Era: Is Backward the Way Forward?" Children's Environmental Health Network, Austin, Texas, February 4th, 2015.
211. "Excavating the enigmas of childhood lead toxicity". Broken Hill City Council and Lead Reference Group, Broken Hill, New South Wales, Australia, March 3rd, 2015.
212. "Prevention Paradox: Why a Little Lead is Too Much". Unequal Exposure Symposium, Climate Change Research Center, University of New South Wales, March 5th, 2015, Sydney, Australia.
213. "Crime of the Century: Our Failure to Prevent the Lead Pandemic". 10th Annual Break the Cycle Conference, Emory University, Atlanta, Georgia. April 23rd, 2015.
214. "The Staggering Cost of Lead Toxicity and the Unbelievable Benefit of Preventing It". 10th Annual Break the Cycle Conference, Emory University, Atlanta, Georgia. April 24th, 2015.
215. Seventh Annual Controversies in Pediatric Environmental Health Debate, "GMOs: A Hazard or Harvest of Health?" A debate with Joel Forman, MD and Daniel Goldstein, MD, (Bruce Lanphear, Moderator and Organizer). Pediatric Academic Societies Meeting, San Diego, California, April 27th, 2015.
216. "Impact of Dwellings on Child Health", Canadian Green Building Council Conference, Vancouver Convention Center, Vancouver, BC, April 28. 2015.
217. "Impact of Tobacco on the Developing Brain", Developmental Effects of Nicotine and Implications for Emerging Tobacco Products, Rockville, Maryland, May 5th, 2015.
218. "Impact of Toxins on the Developing Brain" India Tour (Bengaluru, Trivandrum, Kolkata, and Chandigarh) Sponsored by PAN-India, September 4th-11th, 2015.
219. "Impact of Dwellings on Child Health", Green School Summit, Calgary, Alberta, September 25th. 2015.

220. "Prevention Paradox: Why a Little Lead is Too Much", A debate with George Rhoads, Montefiore Medical Center, Tarrytown, October 2nd, 2015.
221. "Crime of the Century: Our Failure to Prevent the Lead Pandemic" (Keynote Presentation), University of Cincinnati Department of Environmental Health 50th Anniversary Gala, Cincinnati, Ohio, October 9th, 2015.
222. "Impact of Toxins on the Developing Brain" (Keynote Presentation) Children's Environmental Health Centers Annual Meeting, Washington, DC, October 31, 2015.
223. "The Impact of Toxins on the Developing Brain: Our Failure to Prevent Brain-based Disorders in Children", National Core for Neuroethics, UBC November 12th, 2015.
224. "Impact of Dwellings on Child Health", Canada Green Building Council, Toronto, ON Green, December 1st, 2015.
225. "The Tortuous Road to Prevention: Are We There Yet", Air Quality and Impacts on Health: Beyond the Heart and the Lungs, The Lung Association of BC, February 28th, 2016.
226. "Lead's Long Shadow: What the Story of Flint, Michigan Means for All of Us", with Bruce Lanphear, Mona Hanna-Attisha and Marc Edwards. Collaborative on Health and the Environment Webinar, March 8th, 2016.
227. "Little Things Matter: The Impact of Toxins on the Developing Brain", Collaborative on Health and Environmental Alaska Working Group Webinar, March 9th, 2016.
228. "Victories in Public Health: Progress or Adaptation?", Symposium Against Indifference, Ashland University, Ashland, Ohio, April 5th, 2016.
229. "Little Things Matter: The Impact of Toxins on the Developing Brain" (Keynote), Children's Environmental Health: New Findings from California Research, Sacramento, California, April 7th, 2016.
230. "Crime of the Century: Our Failure to Prevent the Lead Pandemic", Distinguished Visiting Professor in Health Law, Loyola University, Chicago, Illinois April 21st, 2016.
231. "The Population Impact of Toxins on Intellectual Abilities: Implications for Policy and Prevention", in Symposia on Environmental Toxins and the Brain: Growing Evidence of Risk, Pediatric Academic Societies, Baltimore, MD, May 2nd, 2016.
232. "Data Visualization and Video Production for Public Consumption", in Symposia on Innovative Tools to Enhance Knowledge Translation of Environmental Health: Data Visualization, Videos and Message Mapping, (co-Moderated by Mark Miller and Bruce Lanphear), Pediatric Academic Societies, Baltimore, MD, April 30th, 2016.
233. "Crime of the Century: Our Failure to Prevent the Lead Epidemic", Michigan State University, Flint, MI, May 7th, 2016.

234. "Crime of the Century: Our Failure to Prevent the Lead Epidemic", Johns Hopkins University School of Public Health, Baltimore, MD, May 7th, 2016.
235. "Little Things Matter: The Impact of Toxins on the Developing Brain", Baltimore, MD, International Medical Federation Autism Research (IMFAR), May 8th, 2016.
236. "Public Health Matters: Videos on Toxic Chemicals, Air Pollutants and the Prevention Paradox", Mongolian National University of Medical Sciences, June 23, 2016.
237. "Little Things Matter: The Impact of Toxins on the Developing Brain", USC Annenberg Center for Health Journalism, July 18th, 2016.
238. "Preventing Lead Toxicity", California Environmental Protection Agency, Occupational Environmental Health Hazard Assessment, September 23rd, 2016.
239. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease," World Issues Forum, Fairhaven College, University of Western Washington, (with Bob Lanphear), November 2, 2016.
240. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", Pediatric Grand Rounds, Maimonides Hospital, November 15th, 2016.
241. "Little Things Matter: The Impact of Toxic Chemicals on the Child Health" (Keynote), Hudson Valley Perinatal Conference, November 16th, 2016.
242. "Little Things Matter: The Impact of Toxins on the Developing Brain", IPEN, San Francisco, CA, November 18th, 2016.
243. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease", SFU, UBC and UW Annual Occupational and Environmental Health Conference Semiahmoo, WA, January 5th, 2017.
244. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease", University of New Brunswick, January 25th, 2017.
245. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", New Brunswick Children's Environmental Health Collaborative, January 26th, 2017.
246. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease", Rockefeller Center, Bellagio, Italy, February 22nd, 2017.
247. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", The Science in Society Speaker Series, Okanagan College, Vernon, BC, April 6th, 2017.
248. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain" (invited plenary), Vancouver, British Columbia, Canadian Pediatric Society, June 3rd, 2017.
249. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease", Macquarie University, Sydney, Australia, September 29th, 2017.

250. "Unleashing the Power of Prevention: Creating Video to Re-Imagine our Approach to Disease", Brown University, Providence, Rhode Island, October 13th, 2017.
251. Cause or Cure: Does the Relentless Pursuit of a Cure Endanger our Health? University of Alaska, Alaska Tribal Health Consortium, Anchorage, Alaska, November 2nd, 2017.
252. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain" (Keynote), All Alaska Pediatric Conference, Anchorage, Alaska, November 3rd, 2017.
253. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", CINBIOSE 30th Anniversary, University of Quebec at Montreal, Montreal, November 9th, -10th, 2017.
254. "The Legacy of Lead Poisoning: Moving towards Prevention". East Chicago Community Meeting, Illinois, November 26th, 2017.
255. "Cause or Cure", NIEHS Environmental Health Seminar, University of Southern California, Los Angeles, California, December 1st, 2017.
256. "Little Things Matter: The Impact of Lead on Brain Development" (Keynote Presentation), Workshop on Lead-Free Schools, Pew Trust, Washington, DC, December 6th-7th, 2017.
257. "Low-level Toxicity of Chemicals: No Acceptable Threshold?" Risk Modeling, Mitigation and Modeling in Health Sciences, Centre de Recherches Mathematiques, Montreal, QC, December 11th, 2017.
258. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", Department of Psychology and Neuroscience, York University, Toronto, ON, December 13th, 2017.
259. "The impact of Pollutants on Human Health: No Safe Levels?", Center for Energy and Environmental Contaminants, Macquarie University, Sydney, Australia, February 13th, 2018.
260. "Cause or Cure: Does the Relentless Pursuit of a Cure Endanger our Children's Health?", Department of Pediatrics, University of Wisconsin at Madison School of Medicine, Madison, Wisconsin, March 1st, 2018.
261. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", Wisconsin Environmental Health Network, Madison, Wisconsin, March 2nd, 2018.
262. "Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain", Biennial Atlantic Symposium on Learning Disabilities Association, Fredericton, NB.
263. "Crime of the Century: The Failure to Prevent the Lead Pandemic" (Keynote). 11th UK and Ireland Environmental and Occupational Epidemiology, John Snow Lecture Hall, London School of Hygiene and Tropical Medicine, April 27th, 2018.
264. "The Impact of Pollutants on Human Health: No Safe Levels?" From Toxicology to Planetary Health, London School of Hygiene and Tropical Medicine, April 27th, 2018.

265. Topic Symposium: “Toxic Chemicals and the Rise of Chronic Disease in Childhood: A Preventable Epidemic?” (chair and speaker), Pediatric Academic Societies, May 7th, 2018.
266. “Prevention Paradox; Why a Little Lead is Too Much”, Ontario Water Advisory, Toronto, CA, May 7th, 2018.
267. “How the Secrets of Body Care and Cleaning Products Impact your Health”, Panel with Bruce Lanphear, Muhannad Malas and Janie McConnell, Centre for Free Expression, Ryerson University, Toronto, ON, May 7th, 2018.
268. “Prevention Paradox; Why a Little Lead is Too Much” (Keynote), Pittsburgh, PA, Get the Lead Out Conference, May 9th, 2018.
269. “Low-level Lead Exposure and Mortality”, Global Health Forum, Miami, FL, May 23rd, 2018.
270. “Unleashing the Power of Prevention: Targeting Toxic Chemicals and Pollutants”, Canadian Public Health Association, Montreal, QC, May 28th, 2018.
271. “The Impact of Pollutants on Human Health: No Safe Levels?” Chemicals Management Plan Stakeholder Advisory Council, Health Canada, May 30th, 2018.
272. “Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain”, Pediatric Grand Rounds, University of California – Davis, Sacramento, CA, June 8th, 2018.
273. “Why a Little Lead is Too Much”, Health Canada, Ottawa, ON, August 29th, 2018.
274. “Unleashing the Power of Prevention: Mobilizing Science to Prevent Disease”, ISEE-ISES Workshop, Ottawa, ON, August 30th, 2018.
275. “The Lingering Legacy of Lead: Why a Little Lead is Too Much”, LA Lead Summit: A Strategy for Prevention, University of Southern California, September 14th, Los Angeles, CA.
276. “Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain”, Children’s Hospital of Orange County, Orange County, CA, September 19th, 2018.
277. “The Lingering Legacy of Lead: Why a Little Lead is Too Much”, Hurley Medical Center, Flint, Michigan, October 3rd, 2018.
278. “Lead and The Mysterious Decline in Coronary Heart Disease”, National Institute of Occupational Safety and Health, Cincinnati, OH, October 11, 2018.
279. “Little Things Matter: The Impact of Toxic Chemicals on the Developing Brain”, Grand Rounds, Oregon State Health University, Portland, OR, October 23, 2018.
280. “The Impact of Pollutants on Human Health: No Safe Levels?” Oregon Environmental Council, Portland, OR, October 23, 2018.
281. “Little Things Matter: The Impact of Toxic Chemicals and Organic Food on Children’s Health”, HIPP Scientific Symposium on Organic Food, Kranzberg, Germany, October 30, 2018.

282. “The Mysterious Decline in Coronary Heart Disease”, Harvard University Lead Summit, Cambridge, MA, November 15th, 2018.
283. “The Impact of Pollutants on Human Health: No Safe Levels?” Department of Epidemiology, UMass, Amherst, MA, November 16th, 2018.
284. “Little Things Matter: The Impact of Toxic Chemicals on Human Health”, School of Public Health, Oregon State University, Corvallis, Oregon, April 12th, 2019.
285. Why A Little Lead is Too Much: An Intimate History”, “The Impact of Pollutants on Human Health: No Safe Levels?”, Graduate Course in Environmental Health, School of Public Health, University of California, Berkeley, April 17th, 2019.
286. “The Impact of Pollutants on Human Health: No Safe Levels?”, Department of Environmental Health, School of Public Health, University of California, Berkeley, April 17th, 2019.

Grants

Active Grant Awards

1. Consultant (Joseph Braun, PI). Early Life Perfluoroalkyl Substance Exposure and Obesity: Mechanisms and Phenotyping. 02/01/2016-01/31/2021. National Institutes of Health, \$523,725 (5% effort). The purpose of this award is to study the impact of exposure to perfluoroalkyl chemicals on the development of child obesity, adverse cardiometabolic markers and gene regulation. (2.5% effort)
2. Co-Applicant (Linda Booij, Maryse Bouchard PI). In utero exposure to Bisphenol-A and the developing brain in humans: A longitudinal study of epigenetic mechanisms. 03/01-2016 – 03/31/2019. Canadian Institutes of Health Research (CIHR), \$344,025. (2.5% effort).
3. Principal Investigator (Multiple PI Award with Christine Till). “Impact of early life fluoride exposure on cognitive and behavioural outcomes in children”. NIEHS, 09/30/16 – 05/01/19, \$296,683 (10% effort).
4. Consultant (Aimin Chen, Principal Investigator). Developmental neurotoxicity of organophosphate and novel brominated flame retardants in children. National Institute for Environmental Health Sciences. 1RO1ES028277. 09/30/2017-06/30/22 (10% effort).
5. Mentor (Cynthia Curl, Principal Investigator). Measurement of Agricultural and Dietary Glyphosate Exposure among Pregnant Women. National Institutes of Environmental Health Sciences. 1KO1ES028745-01A1. 09/01/2018-08/31/2022 (5% effort).

Past Grant Awards

1. Principal Investigator, "Dust-Lead and Blood Lead Levels among Urban Children". The National Center for Lead-Safe Housing, \$561,619, 06/15/93 to 08/31/94. Department of Housing and Urban Development Contract MDLPT0001-93. (25% effort).
2. Principal Investigator, "Determinants of Lead Exposure among Children in Monroe County, NY", NIEHS Pilot Grant, University of Rochester School of Medicine and Dentistry, Department of Environmental Medicine. \$7,600, 06/15/93 to 12/31/95. (0% effort)
3. Principal Investigator, "The Effectiveness of Dust Control in Reducing Children's Blood Lead Levels" U.S. Department of Housing and Urban Development, \$128,394, 04/01/94 to 05/30/95. (25% effort).
4. Principal Investigator, "Primary Prevention of Exposure to Lead". Centers for Disease Control and Prevention, \$832,228, 09/30/94 to 10/01/98. (25% effort)
5. Principal Investigator, "Lead-Contaminated House Dust and Children's Blood Lead Levels". National Center for Lead-Safe Housing, \$43,260, 10/01/96 to 03/30/96. (25% effort).
6. Co-investigator (Christy, PI), "Tuberculosis Screening in Children". New York Department of Health, \$15,000, 01/01/95 to 12/31/96. (0% effort)
7. Co-investigator (Weitzman, PI), "Fellowship Training in General Pediatrics" (Grant # D28PE50008). Bureau of Health Professions, HRSA, U.S. Public Health Service, \$1,752,816, 06/01/96 to 05/30/97. (10% effort).
8. Principal Investigator, "Neurobehavioral Effects of Low-Level Childhood Lead Exposure". University of Rochester School of Medicine & Dentistry, \$8,560, 06/01/96 to 05/30/97. (0% effort)
9. Principal Investigator, "Neurobehavioral Effects of low-level Lead Exposure in Children". NIEHS Pilot Grant, University of Rochester Department of Environmental Medicine, \$20,035, 09/01/97 to 08/30/97. (0% effort).
10. Co-investigator (Howard, PI), "Effect on Breastfeeding of Pacifiers and Bottle Feeding". Bureau of Maternal and Child Health, \$420,333, 10/01/96 to 09/30/00. (2.5% effort)
11. Co-investigator (Canfield, PI) "Lead and Children's Cognitive Functioning", Research Grants Program, Cornell University. \$17,000, 10/01/96 to 09/31/97 (0% effort).

12. Principal Investigator, "Neurobehavioral Effects of Low-Level Lead Exposure in Children" (RO1-ES 08338). National Institute of Environmental Health Sciences, 12/01/96 to 11/31/01, \$1,946,848. (25% effort).
13. Co-investigator, (Aligne, PI). "Reduction in Passive Smoking among Children with Asthma: A Randomized Trial of HEPA Air Filtration." 10/01/96 to 09/31/97, \$6,000. KIDD Grant, Rochester General Hospital (0% effort).
14. Co-investigator, (DeWitt, PI). "Faculty Development in General Pediatrics". Bureau of Health Professions, Health, Department of Health and Human Services 07/01/97 to 06/30/00, \$338,000. (15% effort).
15. Principal Investigator, "A Side-by-Side Comparison of Allergen Sampling Methods", U.S. Department of Housing and Urban Development, 01/02/98 to 12/31/98, \$163,065. (15% effort).
16. Principal Investigator, "National Research Service Award - Fellowship Training in General Pediatrics and Adolescent Medicine" (1T32PE10027), Health Resources and Services Administration, DHHS. 07/01/98 to 06/30/03. \$634,408. (0% effort).
17. Co-investigator, (Steiner, PI) "Survey of Directors and Graduates of NRSA Fellowship Training Programs", Health Resources and Services Administration, Department of Health and Human Services. 06/01/98 to 06/30/99.
18. Principal Investigator, "Effect of Soil Remediation on Children's Blood Lead Levels in Midvale, Utah". U.S. Environmental Protection Agency, 08/01/98 to 07/30/99. \$62,550. (15% effort).
19. Co-investigator, (Phelan, PI) Trends and Patterns in Playground Injuries among U.S. Children." Ambulatory Pediatric Association, 05/05/99 to 05/04/00. \$9,000 (0% effort).
20. Principal Investigator, "Risk Assessment for Residential Lead Hazards". U.S. Department of Housing and Urban Development, 09/01/99 to 08/30/00. \$102,435. (25% effort).
21. Principal Investigator, "Residential Exposures associated with Asthma in U.S. Children and Adolescents" U.S. Department of Housing and Urban Development, 07/16/99 to 03/15/00. \$30,400. (20% effort).
22. Principal Investigator, "Effectiveness of Lead Hazard Control Interventions – A Systematic Review" National Center for Lead-Safe Housing, 10/01/99 to 06/01/00. \$22,500 (10% effort).
23. Principal Investigator, "Racial Disparity in Blood Lead Levels due to Genetic Variation in Calcium Absorption". NIEHS Pilot Grant, Center for Environmental Genetics, University of Cincinnati, 04/01/00 to 03/31/01. \$28,130 (0% effort).
24. Principal Investigator, "International Pooled Analysis of Prospective, Lead-Exposed Cohorts". National Institute of Environmental Health Sciences, National Institutes of Health, 08/15/00 to 09/14/01, \$16,000. (2.5% effort).

25. Principal Investigator, "A Randomized Trial to Reduce ETS in Children with Asthma" (RO1-HL/ES65731). National Heart, Lung and Blood Institute, National Institutes of Health, 09/29/00 to 09/28/04, \$1,546,848. (25% effort).
26. Co-investigator, (Geraghty, PI) "Breastfeeding Practices of Mothers of Multiples". Ambulatory Pediatric Association, 05/01/01 to 04/30/02. \$5,000 (0% effort).
27. Principal Investigator (Subcontract), "A Longitudinal Study of Lead Exposure and Dental Caries". National Institute of Dental and Craniofacial Research, National Institutes of Health, 08/01/01 to 07/30/04. \$300,000 (10% effort).
28. Co-investigator (Phelan, PI), "Fatal and Non-Fatal Residential Injuries in U.S. Children and Adolescents" U.S. Department of Housing and Urban Development, 03/01/01 to 11/31/01. \$40,700. (5% effort).
29. Principal Investigator, "Prevalent Neurotoxicants in Children" (PO1-ES11261). National Institute for Environmental Health Sciences and U.S. Environmental Protection Agency, 09/01/01 to 09/31/06, \$5,000,000. (30% effort).
30. Principal Investigator, "International Pooled Analysis of Lead-Exposed Cohorts". Centers for Disease Control (RO1/CCR 521049). Centers for Disease Control, 09/15/01 to 09/14/02, \$28,473. (3% effort).
31. Principal Investigator, supplement to "Prevalent Neurotoxicants in Children" (PO1-ES11261). NIEHS, 09/01/02 to 09/31/07, \$1,800,000. (10% effort).
32. Co-Investigator, "ADHD Phenotype Network: Animal Model to Clinical Trial". National Institute of Neurologic Diseases, 09/15/02 to 06/30/05 (15% effort).
33. Principal Investigator, "Linkage of ADHD and Lead Exposure", Springfield, Ohio Department of Health, 02/01/03 to 06/01/04, \$25,000. (0% effort).
34. Co-investigator (Yolton, PI) "Explorations of ETS Exposure on Child Behavior and Sleep" NIEHS, 04/01/04 to 03/30/06, \$300,000. (5% effort).
35. Co-investigator (Haynes, PI) "MRI as a Biomarker of Manganese Exposure". NIEHS, 09/01/04 to 08/30/06, \$300,000. (5% effort).
36. Co-investigator (National Center for Healthy Housing, PI) "Development of a Standardized Housing Assessment for Asthma", U.S. Department of Housing and Urban Development, 11/01/05 to 10/31/07, \$50,000. (5% effort).
37. Co-Investigator (Hershey, PI) "Epithelial Genes in Allergic Inflammation" National Institutes of Allergy and Infectious Diseases", 07/01/06 to 06/30/07, \$4,787,541. (3% effort).

38. Co-Investigator and Mentor (Wilson, PI), "Racial Difference in DNA Adducts in Tobacco-Exposed Children". Dean's Scholar Award, University of Cincinnati, 02/22/06 to 01/21/09, \$150,000 (5% effort).
39. Principal Investigator, "National Research Service Award - Fellowship Training in Primary Care Research," (1T32PE10027), Health Resources and Services Administration, DHHS. 07/01/98 to 06/30/08. \$1,600,000. (0% effort).
40. Co-Investigator and Mentor (Kahn, PI). "Childhood Asthma in an Era of Genomics: Will the Generalist's Role be Recast?" Robert Wood Johnson Generalist Physician Faculty Scholars Program" 06/01/04 to 05/30/08, \$300,000.
41. Co-Investigator and Mentor (Spanier, PI), "Exhaled Nitric Oxide to Manage Childhood Asthma". National Heart, Lung and Blood Institute, 07/01/06 to 06/31/08, \$200,000 (10% effort).
42. Co-investigator (Sub-Contract PI), BYPL Vanguard Center (Specker, Principal Investigator), "National Children's Study", National Institute for Child Health and Development, 11/01/05 to 10/31/10, \$500,000. (20% effort). [Relinquished with relocation to SFU].
43. Associate Director and Co-Investigator, (Ho, PI). "Center for Environmental Genetics," NIEHS, 04/01/08 to 3/31/13, \$1,000,000 (10% effort). [Relinquished with relocation to SFU.]
44. Co-Investigator (Yolton, PI). "Tobacco Smoke and Early Human Behavior". Clinical Innovator Award, Flight Attendant Medical Research Institute", 07/01/07 to 06/30/10, \$300,000. (3% effort).
45. Co-Investigator (Spanier, PI). "Low Level Prenatal Tobacco Exposure and Infant Wheeze." Young Clinical Scientist Award, Flight Attendant Medical Research Institute, 07/01/07 to 06/30/12, \$300,000. (5% effort).

PERSPECTIVE

Controversy: The evolving science of fluoride: when new evidence doesn't conform with existing beliefs

Christine Till¹ and Rivka Green¹

Over the past 75 years, health authorities have declared that community water fluoridation—a practice that reaches over 400 million worldwide—is safe. Yet, studies conducted in North America examining the safety of fluoride exposure in pregnancy were nonexistent. When a Canadian study reported that higher fluoride exposure in pregnant women was associated with lower IQ scores in young children, critics attacked the methodology of the study and discounted the significance of the results. Health authorities continued to conclude that fluoride is unequivocally safe, despite four well-conducted studies over the last 3 years consistently linking fluoride exposure in pregnancy with adverse neurodevelopmental effects in offspring. We describe the challenges of conducting fluoride research and the overt cognitive biases we have witnessed in the polarized fluoride debate. The tendency to ignore new evidence that does not conform to widespread beliefs impedes the response to early warnings about fluoride as a potential developmental neurotoxin. Evolving evidence should inspire scientists and health authorities to re-evaluate claims about the safety of fluoride, especially for the fetus and infant for whom there is no benefit.

Pediatric Research _#####_; <https://doi.org/10.1038/s41390-020-0973-8>

Do not avoid difficult areas of investigation. Take risks. If scientists exclusively choose the safe routes, avoid controversial research problems and play only minor variations of someone else's themes, they voluntarily turn themselves into technicians. Our craft will indeed be in peril.¹ Herbert Needleman, MD

Most people assume that community water fluoridation (CWF)—adding fluoride to public drinking water supplies—is a safe and effective way to prevent cavities. After all, it has been endorsed by public health, dental and medical organizations since it was introduced 75 years ago.^{2,3} Today, about three-fourths of people in the United States and one-third of Canadians have fluoride added to their drinking water.

After reviewing the scientific literature, it became clear that there were growing concerns about fluoride as a developmental neurotoxin.^{4,5} In 2006, a report by the National Research Council (NRC)⁶ acknowledged that fluoride exposure may be associated with adverse cognitive and endocrine outcomes, and recommended further study, especially for vulnerable populations. One NRC panel member, Dr. Isaacson, said the report “should be a wake-up call”. Yet, nearly 10 years later, not a single study had directly examined fetal exposure to fluoride in humans.

In many academic circles, it is a taboo to study fluoride. Dr. Phyllis Mullenix,⁷ former Head of the Toxicology Department at the Forsyth Dental Centre in Boston, was heavily criticized for publishing her study showing that sodium fluoride was neurotoxic to developing rats. People who questioned the safety of water fluoridation are quickly dismissed as zealots or anti-science fanatics. Indeed, some scientists dismissed our funding application with comments such as, “This study is not needed. We know that

fluoride is safe”. But we forged ahead; shouldn't claims about safety be based on evidence?

In 2015, we sought funding to investigate the safety of fluoride exposure in pregnancy. We assembled an interdisciplinary team of scientists from complementary fields including epidemiology, environmental health, neuropsychology, and dentistry—knowing that diverse perspectives would be critical for minimizing conscious or unconscious biases in our investigative process. We naively expected that the public health and medical community would trust the scientific process.

THE SCIENTIFIC PROCESS

We studied 512 mother–child pairs enrolled in the MIREC (Maternal Infant Research on Environmental Contaminants) study. The families lived in six Canadian cities; 40% lived in cities with CWF. To our astonishment, we found that higher levels of fluoride in pregnant women and water concentrations were associated with a 3- to 5-point lower IQ score in their 3- to 4-year-old children.⁸ We thought there may be other factors at play, but this association held up after accounting for important characteristics of the study population and looking at the relationship in many different ways.

In August 2018, we presented our findings at an international meeting held in Ottawa. We were nervous how the results would be received by the audience, which included members from Health Canada and other public health agencies. Afterwards, someone approached me and said, “Congratulations – you have just sabotaged your career before it even started”. Rivka Green

As part of our agreement, our manuscript required approval by the MIREC Biobank before we submitted it for publication.

Published online: 22 May 2020

Considering the sensitive nature of the topic, the manuscript was sent to reviewers from various divisions of public health. In over 60 pages, we responded to over 200 specific critiques. The upshot of addressing each critique was that we were able to do better science by refining our methods.

We submitted the manuscript to three top medical journals; two did not send it for peer review because it was “of low research relevance”. As we waited, we hired an independent data analyst to rerun all of the analyses for the third time. In April 2019, *JAMA Pediatrics* accepted our paper. We responded to several additional rounds of review by the *JAMA* editors until we eventually reached a compromise that reflected the strength of the evidence, as well as their implications for public health.

One year after that conference in Ottawa, our article was published on August 19, 2019. In only 2 months, it was viewed over 100,000 times and ranked among the top 0.0005% of research output scored by Altmetric. We expected our study would reignite the debate about the safety of fluoridation, but we didn't expect we would be at the crossfire of this political and polarized debate.

THE BACKLASH

Outside of our colleagues in environmental epidemiology, who were initially skeptical, the results were met with resistance. Attempts to debunk the data were especially apparent from “experts” who held strong beliefs about the benefits and safety of fluoridation.

There are thousands of articles pointing to the safety of community water fluoridation ... this study doesn't change the benefits of optimally fluoridated water and exposure to fluoride.⁹ Dr. Braun, chair of the AAP Section on Oral Health Executive Committee

Yet, there are no other prospective studies with biomarkers of fluoride in pregnant women living in regions with CWF. Canada's national newspaper rang with the headline, “Fluoride won't make you dumber, but the ‘debate’ about its safety might”.¹⁰ Didn't the NRC deliberately call for more studies to address this “debate”?⁶

Vitriolic comments and claims with little scientific basis, such as the results are driven by outliers, were made by the American Council on Science and Health¹¹ and the UK-based Science Media Centre,¹² both heavily funded by the pharmaceutical and food and beverage industries. In reality, we presented our models with and without outliers and the effect remained. These types of vacuous claims exemplify attempts to manipulate the scientific evidence and manufacture doubt.

So what this study found was just an association. And we know from other areas ... they are inherently problematic and inherently complex.¹³ Timothy Caulfield, University of Alberta

This was not a scholarly debate on the neurotoxicity of fluoride; it was an attack on IQ scores, statistical methodology, and observational studies. Ironically, the evidence showing that CWF protects against tooth decay was largely based on observational or “association” studies, most of which were conducted prior to the introduction of fluoridated toothpaste in the early 1970s.¹⁴ Moreover, most landmark studies in public health—including those linking smoking with lung cancer, air pollution with coronary heart disease, and asbestos with mesothelioma—were observational. Indeed, this design is optimal to study many important public health problems, usually in conjunction with toxicological studies.

There is no sensible biochemical reason why fluoride would harm the brains of boys but not those of girls. So, are the authors wrong? Probably.¹⁵ Alex Berezow, Ph.D., Vice President of Scientific Affairs, American Council on Science and Health

Our paper continued to be attacked in scientific and public arenas, many of them drawing upon critiques made by the industry-funded groups. Accusations that our data did not support our conclusions spread quickly and were propagated by social media. “Experts” wrote that the association between maternal urinary fluoride and lower IQ in males, but not females, defied plausibility. However, as we noted in our original proposal, males are often more susceptible to toxicants and failure to examine sex-specific effects of fluoride exposure may result in missing a potentially vulnerable group. Further, the NTP in 2016 specifically called for more studies on fluoride exposure with an emphasis on sex-specific associations.¹⁶

I'm confused as to why the authors would want to withhold the data.¹⁷ Stuart Ritchey, Ph.D.

On October 23, 2019, a letter signed by 30 health-care professionals and scientists from six countries was sent to the Acting Director and Acting Deputy Director of the NIEHS. The letter cited concerns about the replicability of scientific research in general and the need for transparency. Our research team was accused of “refusing to release data”, but we had not refused to release the data. The policies that govern access to the MIREC Biobank and procedures to access it are sent to anyone who requests the data.

RISK AND BENEFITS

Some critics maintained that our conclusion—that pregnant women should reduce their fluoride intake—overstated the implication of the findings and was “dangerous”. Other critics said that we should not change our actions based on “one study”. We agree that no one study is definitive; we should carefully evaluate the collective evidence from multiple studies, as well as the risks and benefits of fluoridation.

Four high-quality, prospective birth cohort studies^{5,8,18,19} show that fetal exposure to fluoride is associated with diminished cognitive abilities. In November 2019, the National Toxicology Program released a draft report on fluoride concluding that fluoride is presumed to be a cognitive neurodevelopmental hazard. This report was largely ignored by the critics of our study.^{17,20}

Fluoride offers no benefits to the fetus. The beneficial effects of fluoride predominantly occur at the tooth surface, after the teeth have erupted.^{21–23} Accordingly, the Canadian Pediatric Society and the American Academy of Pediatrics advise against fluoride supplements during the first 6 months of life.²⁴

Exposure to fluoride comes from a variety of sources, but for people who live in cities with fluoridated water, the main source of ingestion is drinking water. Importantly, pregnant women and formula-fed babies may not be able to access nonfluoridated water.

CONCLUSION

Did our article shift the needle? Perhaps for those who are willing to integrate new knowledge with their existing beliefs. To understand why many questions about the safety of CWF are still not settled after 75 years, we need to recognize how entrenched beliefs can lead to biases and blind spots, even among highly trained clinicians and scientists. Science advances by continuously challenging old ideas and adjusting our beliefs as new knowledge emerges, even if this new evidence conflicts with conventional wisdom or is inconvenient.

Dr. Lanphear, a senior scientist on our team who conducted many of the pivotal lead toxicity studies that helped confirm Dr. Needleman's work, reminded us that it took two decades of research before the CDC declared, “there is no safe level of lead in children's blood”. Dr. Lanphear wrote, “The critics—who were often paid by industry or simply ignorant about lead toxicity but

still willing to offer their 'expert' opinion—delayed efforts to prevent lead poisoning by decades”.

We typically fret about subtle biases, like recall bias and unmeasured confounding, but confirmation bias, the tendency to ignore or debunk data that does not conform to what we believe, is arguably a much larger problem. Failure to act on consistent evidence that indicates safety risks could amount to enormous costs at the population level.

1 I, Howard Hu, MD, MPH, ScD, declare that:

2 1. I am a physician-scientist trained in internal medicine, occupational/environmental
3 medicine, epidemiology and general public health who has held leadership positions in science and
4 academia for over 2 decades.

5 2. I am also the Principal Investigator of ongoing research that is examining the impact of
6 early-life exposures to fluoride on neurobehavioral development in the offspring participating in the
7 Early Life Exposures in Mexico to Environmental Toxicants (ELEMENT) project.

8
9 **I. SUMMARY OF QUALIFICATIONS**

10 3. A complete summary of my qualifications and publications can be found in my
11 Curriculum Vitae, which has been marked as Plaintiffs' Exhibit 5 and attached herein.

12 4. As relevant to my testimony here, I am an epidemiologist with decades of research
13 experience investigating the impact of environmental toxicants on human health. In 1990, I received a
14 Doctor of Science degree in Epidemiology from the Harvard School of Public Health, and since that
15 time have taught epidemiology at Harvard, University of Michigan, and University of Toronto, where I
16 served as Dean of the School of Public Health.

17 5. I hold editorial positions on leading environmental and occupational health journals,
18 including the *American Journal of Industrial Medicine*, *Current Environmental Health Reports* and
19 *Environmental Health Perspectives*, and serve as a peer reviewer for the *American Journal of*
20 *Epidemiology*, *Epidemiology*, *Journal of the American Medical Association*, *Lancet*, *New England*
21 *Journal of Medicine*, and *Pediatrics*, amongst others.

22 6. My own epidemiological research has resulted in hundreds of peer-reviewed publications
23 in leading scientific journals. For the past 29 years, this research has been continuously funded by the
24 National Institutes of Health (NIH) through a number of competitive R01 grants.

1 7. The Environmental Protection Agency (EPA) has funded several of my epidemiological
2 studies, including a \$7.8 million research grant to study the effects of metals mixtures on children's
3 health. I have also served as an expert advisor to the EPA, including as a member of EPA's Science
4 Advisory Board on Relative Risk Reduction Strategies and as an expert reviewer of EPA's recent draft
5 report on the concentration-response functions between lead exposure and cardiovascular disease.

6 8. In 1993, I co-founded the ELEMENT research project, a pregnancy and birth cohort that
7 has been funded by both the EPA and NIH. Since its inception, ELEMENT has evolved into a highly
8 successful, award-winning project involving collaborators at the University of Michigan, Harvard, and
9 other academic institutions in the U.S., Canada, and Mexico.

10 9. Through the ELEMENT cohort, we have studied how prenatal exposure to environmental
11 toxicants—including lead, mercury, and fluoride—affect children's health, including their
12 neurodevelopment. Thus far, the ELEMENT cohort has generated over 80 high-impact publications and
13 provided evidence contributing towards environmental health policies around the world, including the
14 EPA's national air standard for lead and the CDC's "Guidelines for the Identification and Management
15 of Lead Exposure in Pregnant and Lactating Women."

16 10. In 2012, following the National Research Council's (NRC) call for more research to
17 investigate the neurobehavioral risks of fluoride exposure, the team I lead successfully competed for a
18 peer-reviewed NIH RO1 grant to study the neurodevelopmental effects of pre- and post-natal fluoride
19 exposures. This research was funded with an understanding that it would provide a major contribution to
20 fluoride risk assessment and policy decision-making on the neurotoxicity concerns identified by the
21 NRC.

22 11. To date, my team has published five peer-reviewed studies on fluoride, including two
23 prospective studies on fluoride and neurodevelopment that were published in the world's two most
24
25
26
27

1 prominent environmental health journals: *Environmental Health Perspectives* and *Environment*
2 *International* (Bashash 2017, Bashash 2018, Cantoral 2019, Liu 2019, Thomas 2016). As with our own
3 research, the journal *Environmental Health Perspectives* is funded by the NIH.

4 **II. SUMMARY OF OPINIONS**

5 12. The ELEMENT prospective cohort studies of fluoride's neurodevelopmental effects are
6 methodologically rigorous studies that provide scientifically reliable and robust results.

7 13. The results of the ELEMENT prospective cohort studies are consistent with and support
8 the conclusion that fluoride is a developmental neurotoxicant at levels of exposure seen in the general
9 population in water-fluoridated communities.
10

11 **III. BASIS FOR OPINIONS**

12 **A. The Methodological Strengths of the ELEMENT Studies**

13 14. ***Prospective Birth Cohort Study Design:*** One of the key strengths of our ELEMENT
14 research is that it has utilized a prospective birth cohort design. Prospective studies (aka longitudinal
15 cohort studies designed at the outset to enable research on the topics of interest and that follow a defined
16 group of individuals) are recognized by epidemiologists as the ideal study design for investigating the
17 impact of environmental toxicants on human health, in part, because the measurement of exposure
18 precedes the development of disease/dysfunction. This is important because it permits greater
19 confidence in the causal relationship of an association since the requirement of temporality is satisfied
20 i.e., the exposure precedes the effect, which, in turn, is one of the components of the Bradford Hill
21 criteria. Where there is suspicion that a chemical may exert a toxic effect *in utero*, a birth cohort study
22 design is critical because it allows an assessment of exposure during the prenatal period.
23

24 15. ***Effective Control for Other Factors that Influence IQ:*** Our ELEMENT studies have
25 considered and controlled for a large number of factors known to affect neurodevelopment, which
26
27
28

1 increases the rigor of the results. First, we excluded women from the study who had characteristics
2 known to affect neurodevelopment, including gestational diabetes, renal disease, hypertension,
3 circulatory diseases, use of illicit drugs, and alcohol consumption. Second, our analyses of fluoride and
4 neurodevelopment controlled for a large number of potential confounders, including maternal age,
5 maternal education, maternal IQ, birth weight, gestational age at time of delivery, sex of child, birth
6 order, maternal smoking, and marital status. Third, we performed sensitivity analyses which controlled
7 for the quality of the child's home environment (i.e., HOME),¹ as well as prenatal lead and mercury
8 exposures.

9
10 16. **Blinded Assessments:** Our studies employed a "blinded" study design where neither the
11 examiners nor the subjects were aware of the subject's fluoride exposure status at the time of the
12 neurodevelopmental exams. A blinded study design is superior to a non-blinded study because it helps
13 protect against bias, including unconscious bias, in the assessment.

14 17. **Individual Biomarkers of Both Prenatal and Postnatal Exposure:** As cohort studies, our
15 investigations have collected and utilized individual measurements of fluoride exposure, covariates, and
16 the outcomes of interest. Cohort studies with individual measurements of exposure, covariates and
17 outcomes are considered much more robust than studies with group-level metrics (otherwise known as
18 "ecological studies") because the accuracy and precision of individual-level measures are far superior to
19 the estimates of these parameters that are associated with ecological studies. In our studies, we measured
20 prenatal fluoride exposure by testing archived samples of the mother's urine that were collected during
21 pregnancy. Urine fluoride is a well-accepted biomarker of total fluoride exposure. As the EPA has
22
23

24
25 ¹ The HOME Score is a rating that is performed by a research observer who gains permission to
26 enter the home and observe the interactions between the offspring and other family members, as well as
27 other characteristics of the home environment. It is intended to try to capture the ability of the home to
enrich a child's educational development and skill development. It is often highly correlated with socio-
economic status, but it also has some independent value of its own in determining a child's
neurodevelopmental trajectory.

1 recognized, “archives of biological samples from birth cohort studies . . . provide critical information on
2 the prenatal and childhood determinants of adult disease” (EPA-NIEHS 2017, p. 9). The archived urine
3 samples in our studies were tested under the oversight and direction of Dr. Angeles Martinez-Mier, a
4 leading authority on the measurement of fluoride in urine and plasma.

5 18. As I acknowledge and discuss further below, there are some limitations with our urine-
6 based exposure estimates. These limitations, however, do not provide a plausible explanation for the
7 results we have observed as they create *non-differential* imprecision in the exposure variable (in this
8 case, the non-differential exposure misclassification is sometimes referred to as “random” or “classical”
9 measurement error associated with exposure). It is a basic epidemiologic axiom that non-differential
10 errors, such as non-differential exposure misclassification, bias the results towards the null (i.e., no
11 association exists), rather than create spurious associations where none otherwise exist. I discuss this
12 further below.
13

14 19. ***Large Cohort Sizes:*** Our studies have involved a sufficiently large number of mother-
15 offspring pairs to permit statistical analyses that are stable and robust. In our 2017 study (“Bashash
16 2017”), we investigated fluoride’s relationship with intelligence among 299 mother-offspring pairs. This
17 included 287 mother-offspring pairs for the analysis of intelligence at age 4, and 211 mother-offspring
18 pairs for an analysis of intelligence at ages 6-12. In our 2018 study (“Bashash 2018”), we investigated
19 the relationship between fluoride and symptoms of Attention-Deficit Hyperactivity Disorder (ADHD)
20 among a total of 213 mother-offspring pairs, with the ADHD assessment conducted between the ages of
21 6 and 12.
22

23 20. ***Reliable Neurocognitive Tests:*** Our 2017 study on intelligence used validated,
24 standardized neurocognitive tests that were administered by a team of psychologists. For the 4-year old
25 children, we used the McCarthy Scales of Children’s Abilities (MSCA), and focused on the General
26
27

Cognitive Index (GCI) score. For the 6-12 year old children, we used the Spanish version of the Wechsler Abbreviated Scale of Intelligence (WASI)² to assess Full-Scale IQ. All raw scores were standardized for age and sex. The examining psychologists were trained and supervised by an experienced developmental psychologist, and independent testing confirmed a very high correlation (0.99) in the scoring, thus confirming a high degree of inter-examiner reliability.

21. ***Reliable Neurobehavioral Tests:*** Behaviors associated with ADHD were assessed using the Spanish version of the Conners' Rating Scales-Revised (CRS-R)³ and Conners' Continuous Performance Test (CPT-II, 2nd Edition).⁴ All measures of ADHD-behaviors were standardized for age- and sex. Higher T-scores (mean of 50, SD of 10) indicate poorer performance. All psychometric tests were applied under the supervision of an experienced psychologist.

22. ***Appropriate Statistical Analyses that Did Not Assume Linearity:*** We used the same standard statistical analyses for our fluoride studies as we have used for our other ELEMENT studies. These included regression analyses that appropriately adjusted for potential confounders, as well as Generalized Additive Models (GAM) that visualized adjusted associations between fluoride and neurodevelopment for purposes of assessing the linearity of the relationship. We did *not* assume

² The WASI shows strong criterion validity with the full-length Wechsler Intelligence Scale for Children (WISC-III; ages 6-16 yrs), and the Wechsler Adult Intelligence Scale (WAIS; ages 16+ yrs). The correlation coefficient between the Full Scale IQ of the WASI and WISC-III is 0.81 (Wechsler, 1991), and 0.92 between the WASI and the WAIS-III (Wechsler, 1999), indicating a high covariance between the abbreviated and full-length measures of intellectual ability. The WASI is also correlated with another abbreviated IQ test, the Kaufman Brief Intelligence Test ($r = 0.89$), providing evidence for convergent validity (Hays et al., 2002). Finally, the WASI demonstrates excellent internal consistency (reliability=0.976) (based on data from Tables 5.1 and 5.8 of the WASI manual).

³ The CRS-R contains three ADHD scales that correspond with the Diagnostic and Statistical Manual of Mental Disorders – 4th edition (DSM-IV) criteria for ADHD: 1) DSM-IV Inattention Index, 2) DSM-IV Hyperactive-Impulsive Index, and 3) DSM-IV Total Index (inattentive and hyperactive-impulsive behaviors combined). It also examines seven types of behavior problems that were derived through factor analysis, including: Oppositional, Anxious-Shy, Cognitive Problem/Inattention, Hyperactivity, Perfectionism, Psychosomatic, and Social Problems. For our study, we examined the three DSM-IV ADHD scales as our primary outcomes because these scales are intended to screen for ADHD, and are commonly used to study the association between diverse environmental contaminants and ADHD- behavior problems.

⁴ The CPT-II is a computer-administered signal detection paradigm. Using the CPT-II, we measured errors of omission and commission, and hit reaction time (response latency).

linearity in the dose-response relationship. Additionally, we took appropriate steps to eliminate the influence of outliers and influential points.

B. Prenatal Fluoride Exposure Is Associated with Substantial and Significant Adverse Effects on IQ and ADHD-Behaviors in the ELEMENT Cohort

23. In the ELEMENT cohort, we found that prenatal fluoride exposure has a linear, dose-response relationship with reduced IQ among both 4-year old and 6-12 year old children (Bashash 2017).⁵ In our main model that adjusted for potential confounders, we found that each 0.5 mg/L increase in maternal urinary fluoride (which approximates the interquartile range, i.e., the difference between the 25th v. 75th percentile) was significantly associated with a loss of 3.15 GCI points among the 4-year-olds, and a loss of 2.5 IQ points among the 6-to-12 year olds. These are substantial reductions in intelligence that rival the effect sizes associated with lead exposure. As one measure of practical impact developed and published in 2009 by an expert from the Economics Policy Institute, each IQ point lost due to lead exposure was estimated to represent a loss of \$17,815 in present discounted value of lifetime earnings (in 2006 USD) (Gould 2009).

24. Visual assessment of the adjusted associations between fluoride and intelligence confirmed the monotonic, mostly linear nature of the relationships (see Figures A and B). Notably, there was no evidence of a threshold among the 4-year olds, although there was some suggestion of a threshold at approximately 0.8 mg/L among the 6-12 year olds.

⁵ We have subsequently reported an analysis, in abstract form, of neurocognitive outcomes at ages 1 to 3, as measured through the Mental Development Index (Thomas 2018). These results are consistent with the age 4 and age 6-12 analyses in that they show significant adverse associations with maternal urinary fluoride. I do not rely on these results here, however, since they have not yet been published in full

Figure A: Visual Association Between Maternal Urinary Fluoride and Intelligence at Age 4

Figure B: Visual Association Between Maternal Urinary Fluoride and Intelligence at Ages 6-12

1 25. In contrast with prenatal exposures, we did not find statistically significant associations
2 between IQ and childhood urinary fluoride levels at ages 6 to 12, although there was some suggestion of
3 an adverse effect. This suggests that the timing of fluoride exposure is an important determinant of
4 fluoride's neurodevelopmental effects, and is consistent with exposures occurring prenatally being more
5 detrimental than those occurring during school-aged years. This is plausible given fluoride's passage
6 through the placental barrier, and the known enhanced vulnerability of the developing brain to
7 neurotoxins during the *in utero* period.

8
9 26. In addition to IQ, we have also found a significant association between prenatal fluoride
10 exposure and some attention deficit hyperactivity disorder (ADHD)-like behaviors on the CRS-R test,
11 including cognitive problems and inattention (Bashash 2018). As with our IQ analyses, the associations
12 were linear, although—as we have found for lead (Huang 2016)—there was some indication in some of
13 the analyses of a ceiling effect at higher doses (i.e., the dose-response curve for cognitive problems and
14 inattention began to flatten above 1 mg/L).

15 27. The effect sizes between prenatal fluoride and ADHD behaviors in our cohort were
16 substantial. For those effects which reached statistical significance, increases of 0.5 mg/L in maternal
17 urinary fluoride were associated with 2.4 to 2.8-point higher scores (higher scores reflect indicate poorer
18 performance). Whereas IQ is standardized to a mean of 100, the ADHD behavior scales are standardized
19 to a scale of 50. The effect sizes that we found for prenatal fluoride are similar to what we have found
20 for childhood blood lead levels (Huang 2016).
21
22
23
24
25
26
27

Figure C: Association Between Maternal Urinary Fluoride & ADHD Behaviors

28. We did not find statistically significant associations between fluoride and ADHD-behaviors on the CPT-II test. Other studies of environmental chemicals have reported similar discrepancies between the two tests, suggesting that they are assessing different constructs. The stronger association that we found between fluoride and ADHD behaviors on the CRS-R scale may be explained by the CRS-R's focus on constructs that rely on attention (e.g., new learning, ability to hold information and complete tasks, organizational skills, etc).

29. The relationship we observed between fluoride and inattention is consistent with some animal research that has reported a relationship between prenatal fluoride exposure and hypoactive behavioral patterns (Mullenix 1995), as well as prior epidemiological research associating fluoride with impaired working memory (Choi 2015). Working memory is linked with the ability to control attention and it is common for youth with ADHD to have weaknesses in working memory (Kasper 2012).

Fluoride's effect on working memory may relate to an effect on the dopamine system, which fluoride has been found to alter in animal studies (Pal & Sarkar 2014). Dopamine is an important modulatory neurotransmitter in planning and initiation of motor responses, activation, switching, reaction to novelty and processing of reward (Fararone 2015).

30. Some have suggested that the “scatter” in the above scatterplots is a basis to doubt the relation between fluoride and the neurodevelopmental outcomes. Such scatter, however, is typical in epidemiological studies of neurotoxicants, as can be seen in the following figure from our study on lead and neurocognitive effects which the EPA relied upon as evidence of low-level lead neurotoxicity when the Agency set the national air standard for lead (Tellez-Rojos 2006, Fig 1, reproduced as Figure D below). We also found similar scatter in our analysis of blood lead and ADHD behaviors, as measured by CRS-R (Huang 2016, Fig. 1, reproduced as Figure E below). The scatter relates to the fact that there are multiple factors that impact on intelligence and behavior; however, unless they are confounders (which we controlled for), they do not preclude the ability to focus on the specific effect of fluoride.

Figure D: Association Between Childhood Blood Lead Levels and Mental Development Index

Figure E: Association Between Childhood Blood Lead Levels and ADHD Behaviors

C. The Limitations of Our Studies Do Not Provide Plausible Alternative Explanations for the Results

31. Every epidemiological study, including our studies on fluoride and neurodevelopment, has its limitations. Some of these limitations could theoretically be avoided through the use of human experiments where the toxicant is delivered to the study participants in a controlled and randomized manner. Human experimentation on neurotoxicants, however, is strictly prohibited for obvious ethical reasons. We are thus left with “observational” studies to investigate the impact of environmental toxicants on human health, with prospective cohort studies being the study design best suited for this purpose.

32. As is often the case with epidemiological studies of environmental toxicants, there are limitations in the exposure measurements that we have used in the ELEMENT studies. Our use of spot samples to collect the urine introduces some imprecision into the exposure measurement because urinary

1 fluoride concentrations can fluctuate somewhat throughout the day. This imprecision would have been
2 reduced through the use of 24-hour urine collection samples, and, to a lesser extent, fasting first-morning
3 voids, which are both considered more rigorous measures of fluoride exposure. We compensated for this
4 limitation by using “timed” samples (i.e., second void in the morning) and adjusting for urinary
5 creatinine. Urinary fluoride concentrations fluctuate during the day in large part because fluctuations in
6 an individual’s hydration during the day result in fluctuations in urinary dilution (and therefore, urinary
7 concentrations). Adjusting for urinary creatinine is particularly important because the resulting measure
8 adjusts for urinary dilution. As a result, measures of fluoride in spot urine samples adjusted for
9 creatinine have been found to have excellent agreement with 24-hour samples (Zohouri 2006). Timed
10 spot samples also have an important advantage over 24-hour samples in that they are less imposing on
11 study participants. This is an important consideration when designing cohort studies because the
12 imposition of difficult tasks like collecting 24-hour urines serve to reduce participation, which, in turn,
13 reduces the study’s sample size and statistical power.⁶
14

15 33. Another limitation in our exposure measurements is that, for most of the mothers, we did
16 not have urine samples for every trimester. In our age 4 IQ analysis, 49%, 42%, and 9% of the mother-
17 offspring pairs had urine samples for one, two, and all three trimesters, respectively. In the age 6-12
18 analysis, the respective percentages were 56%, 39%, and 5%; while in the ADHD study, the respective
19 numbers were 57%, 36.4%, and 6.5%. It is common for prospective cohort studies to only have one or
20 two exposure measurements during the prenatal period, but this does not introduce undue imprecision in
21 the exposure estimate, as exposures to a toxicant have limited variation during pregnancy.
22

23 34. Importantly, the imprecision in our exposure measurements does not explain the large
24 and significant associations we observed between maternal urinary fluoride and neurodevelopmental
25

26 ⁶ To put it in simple terms, less people will volunteer to participate in a study if it requires them to
27 collect all of their urine throughout the entire day, including while they are in public spaces, such as
28 their work environment and restaurants, etc.

1 effects. Imprecision in exposure measurements (of the classical or random type, as noted above) is a
2 type of non-differential error that introduces scatter into the analysis which has a generally expected
3 effect of biasing the results towards the null hypothesis. To put it another way, imprecisions in exposure
4 measurements make it *harder*, not easier, to detect an association between an exposure and outcome,
5 much like background noise makes it harder to hear a sound or signal of interest. Imprecision in the
6 exposure measurement is thus anticipated to *obscure* an association, rather than create spurious
7 associations where none otherwise exist. Because of this, improvement in the measurement of a
8 particular exposure tends to reveal and strengthen associations associated with that exposure, not
9 eliminate them.
10

11 35. Another limitation with our studies is, as with most observational studies, we could not
12 rule out the potential for uncontrolled confounding from factors that we did not measure. For example,
13 we did not have data on arsenic which is a neurotoxicant that has been associated with fluoride in certain
14 rural drinking water supplies. While it is always preferable to have more data than less, it is unlikely that
15 arsenic is a meaningful confounder in our cohort. To be a confounder, a covariate must be associated
16 with *both* the outcome *and* exposure. In our cohort, the main source of fluoride is from *salt*, not water.⁷
17 Accordingly, even if arsenic is correlated with fluoride in rural water supplies in Mexico, this
18 association is unlikely to be materially associated with fluoride exposures in our cohort.
19

20 36. Finally, an additional limitation in our studies is that we did not have information on the
21 iodine status of our cohort. Iodine has been theorized to be a potential effect-modifier for fluoride's
22 nervous system effects, i.e., deficiencies of iodine may magnify fluoride's effects, and vice versa (NRC
23 2006). However, failure to control for an effect modifier is unlikely to produce an association between
24 exposure and outcome that does not otherwise exist. Moreover, in Mexico, salt is required by law to be
25

26 ⁷ The water in Mexico City has low levels of fluoride (i.e., 0.16 mg/L) and thus does not present a
27 meaningful exposure in our cohort (Cantoral et al. 2019).

1 iodized. Fluoride levels in our cohort are thus likely correlated with *increased* iodine. To the extent that
2 iodine modifies the effect of fluoride in our population, it is more likely to be in the direction of
3 *reducing* toxicity rather than magnifying it.

4 **D. Implications of Our Findings to the General Population in Water-Fluoridated**
5 **Areas**

6 37. In 2016, we published the largest characterization to date of urinary and plasma fluoride
7 levels throughout pregnancy (Thomas, et al. 2016). At the time we published this study, there had yet to
8 be a population-based study of fluoride exposures among pregnant women in North America, although
9 there were two small-scale studies available from Israel and Poland. The lack of data from North
10 America prevented us, at that time, from comparing the urinary fluoride levels in our cohort with
11 populations from Canada or the United States.

12 38. Urine and plasma fluoride are metrics of the total absorbed dose of fluoride, sometimes
13 referred to as the “internalized” or “bioavailable” dose. These internalized doses do not currently permit
14 one to directly estimate the amount of fluoride that is ingested (i.e., the “external” exposure), nor do they
15 permit the determination of source apportionment of the fluoride exposures. Internalized doses,
16 however, are more relevant than external intake in predicting toxic effects, since they reflect the
17 concentration of toxics that are being delivered to target organs in the body.

18 39. Our 2016 study presented the urinary and plasma fluoride levels from 825 and 330
19 pregnant women from our cohort, respectively. The urine samples were collected and measured using
20 the procedures discussed above for our neurodevelopmental papers (i.e., early morning 2nd voids that
21 were adjusted for creatinine), and both the urine and plasma samples were tested under the direction of
22 Dr. Angeles Martinez-Mier from Indiana University, a world leader in the measurement of fluoride in
23 biological samples.

24 40. The average creatinine-adjusted urinary fluoride level across all three trimesters in the
25
26
27
28

1 ELEMENT cohort was 0.91 mg/L, with a standard deviation of 0.4 mg/L.⁸ The average plasma fluoride
2 level across all three trimesters was 0.0221 mg/L, with a standard deviation of 0.0164 mg/L.⁹

3 41. By the time we published our 2018 study on ADHD behaviors, general population data
4 had become available on maternal urinary fluoride levels in pregnancy (Till 2018). As we noted in our
5 2018 study, the maternal fluoride levels in the Canadian study are similar to the levels in our cohort
6 (Bashash 2018). The mean (creatinine-adjusted) maternal urinary fluoride level among pregnant women
7 living in the water-fluoridated areas of Canada was 0.87 mg/L, with a standard deviation of 0.50 mg/L,
8 which is clearly in the same range as our cohort (i.e., mean = 0.91 mg/L, SD = 0.4 mg/L). The urine
9 samples in the Canadian study were tested by Dr. Martinez-Mier using the same creatinine-adjustment
10 method, which increases the comparability of the data.
11

12 42. The similarity in maternal urinary fluoride levels between pregnant women in the
13 ELEMENT cohort and water-fluoridated areas of the Canadian cohort is consistent with the fact that
14 both populations are receiving so-called “optimal” levels of fluoride through fluoridation programs (i.e.,
15 salt fluoridation in Mexico, and water fluoridation in Canada). Since salt fluoridation programs are
16 designed to replicate the doses provided by fluoridated water, it is a reasonable, first-order expectation
17 that populations living in salt-fluoridated and water-fluoridated areas will receive similar doses of
18 fluoride.
19

20 43. The maternal urinary fluoride data from the ELEMENT cohort and water-fluoridated
21 areas of Canada support the conclusions that the two populations have essentially the same *internalized*
22 doses of fluoride. The internalized doses in water-fluoridated areas are thus in the range that we have
23

24 ⁸ The 75th and 90th percentile values were 1.09 mg/L and 1.37 mg/L, respectively.

25 ⁹ We tested for and found no correlation between creatinine-adjusted urinary fluoride and
26 sociodemographic variables, including maternal age, maternal education, child sex, smoking status, birth
27 order, and cohort. Although we found a trend towards increasing urinary fluoride levels through the first
28 22-23 weeks of pregnancy, and a reduction thereafter, these trends were not statistically significant
(Thomas 2016).

1 found to be associated with substantial and significant neurodevelopmental harms in the ELEMENT
2 cohort.

3 44. Although direct comparisons of *external* fluoride intake cannot yet be made, such
4 information is not necessary to generalize the neurodevelopmental results from the ELEMENT cohort to
5 water-fluoridated areas.

6 45. There is no identified reason to believe that the neurodevelopmental effects of fluoride
7 will differ by the source of exposure, be it fluoridated salt or fluoridated water; once inside the body the
8 source of fluoride is immaterial.

9 46. For the reasons stated, it is my opinion to a reasonable degree of scientific certainty that
10 the results of the ELEMENT studies support the conclusion that fluoride is a developmental
11 neurotoxicant at levels of internalized exposure seen in water-fluoridated communities.
12

13
14 I declare under penalty of perjury, under the laws of the United States, that the foregoing
15 is true and correct to the best of my knowledge and belief.

16 Executed on May 20, 2020, in Seattle Washington.

EDUCATION:

9/1973-6/1976	Biology	B.Sc.	Brown University
9/1977-6/1982	Medicine	M.D.	Albert Einstein College of Medicine
9/1979-6/1980 (degree in 6/1982*)		M.P.H. (Occ Hlth)	Harvard School of Public Health
9/1985-6/1986	Epidemiology	M.S.	Harvard School of Public Health
7/1986-6/1990	Epidemiology	Sc.D.	Harvard School of Public Health

* Awarding of the Harvard M.P.H. to medical students is delayed until the M.D. degree is conferred

POSTDOCTORAL TRAINING:

Research Fellowships

7/1987-6/1988 Occupational Health Research Fellow, Dept. of Environmental Health
Harvard School of Public Health

Internship and Residencies

7/1982-6/1983	Intern in Medicine	Boston City Hospital
7/1983-6/1984	Junior Assistant Resident, Internal Medicine	Boston City Hospital
7/1984-6/1985	Senior Assistant Resident, Internal Medicine	Boston City Hospital
7/1985-6/1987	Resident, Occupational Medicine	Harvard School of Public Health

CERTIFICATION AND LICENSURE:

1984	Massachusetts Medical License Registration
1985	American Board of Internal Medicine, Diplomate
1987	American Board of Preventive Medicine, Diplomate (Occupational Medicine)
2006	Michigan Medical License Registration
2013	College of Physicians & Surgeons of Ontario
2018	Washington State Medical License Registration

ACADEMIC APPOINTMENTS:

9/1988-6/1992	Instructor in Medicine Department of Medicine, Harvard Medical School
9/1988-6/2006	Associate Physician (Clinical and Research), Channing Laboratory, Department of Medicine, Brigham & Women's Hospital
9/1990-6/1994	Assistant Professor of Occupational Medicine Department of Environmental Health, Harvard School of Public Health

CV: Howard Hu, M.D., M.P.H., Sc.D.

7/1992-6/1997 Assistant Professor of Medicine
Department of Medicine, Harvard Medical School

7/1994-6/2002 Associate Professor of Occupational Medicine
Department of Environmental Health, Harvard School of Public Health

7/1997-8/2006 Associate Professor of Medicine
Department of Medicine, Harvard Medical School

7/2002-8/2006 Professor of Occupational and Environmental Medicine (tenured)
Department of Environmental Health, Harvard School of Public Health

9/2006-6/2012 Chair and Professor of Environmental Health Sciences (tenured), Department of
Environmental Health Sciences, University of Michigan School of Public Health

9/2006-8/2009 Adjunct Professor of Occupational and Environmental Medicine
Department of Environmental Health, Harvard School of Public Health

9/2006-6/2012 Research Associate Physician, Channing Laboratory, Department of
Medicine, Brigham & Women's Hospital

5/2007-2012 Professor of Epidemiology, University of Michigan School of Public Health

5/2007-2012 Professor of Internal Medicine, University of Michigan Medical School

1/2009-2012 NSF International Endowed Department Chair, University of Michigan School of
Public Health, Department of Environmental Health Sciences

7/2012-2018 Professor of Environmental Health, Epidemiology and Global Health (tenured)
Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario,
Canada (on sabbatical/administrative leave, 2017-2018)

7/2012-2018 Professor, School of Medicine, University of Toronto, Toronto, Ontario, Canada

7/2012- Adjunct Professor, Department of Environmental Health Sciences, University of
Michigan School of Public Health

7/2012-2013 Director, Dalla Lana School of Public Health, University of Toronto, Toronto,
Ontario, Canada

7/2013-6/2017 Founding Dean, Dalla Lana School of Public Health, a Faculty of the University
of Toronto, Toronto, Ontario, Canada

7/2017- Affiliate Professor (started as Visiting Scholar until December, 2017),
Department of Occupational and Environmental Health Sciences, University of
Washington School of Public Health, Seattle, WA

ADMINISTRATIVE APPOINTMENTS:

7/1991-6/2006 (Founding) Director, Metals Epidemiology Research Group, Channing Laboratory,
Department of Medicine, Brigham and Women's Hospital, Harvard Medical School, and
Department of Environmental Health, Harvard School of Public Health

7/1992-6/1995 Director, Commission to Investigate the Health and Environmental Effects of Nuclear
Weapons Production, International Physicians for the Prevention of Nuclear War

7/1996-6/2006 Director, Residency Program in Occupational and Environmental Medicine, Harvard
School of Public Health

7/1996-8/2006 Director, Occupational and Environmental Medicine Core, National Institute for
Occupational Safety and Health Educational Resource Center at the Harvard School of

CV: Howard Hu, M.D., M.P.H., Sc.D.

Public Health

- 7/1998-6/2004 (Founding) Medical Editor, Environmental Health Perspectives (official journal of NIEHS)
- 7/2000-8/2006 Associate Director, the Harvard NIEHS Environmental Sciences Center, Harvard School of Public Health
- 7/2004-6/2009 (Founding) Principal Investigator and Director, Harvard Center for Children's Environmental Health and Disease Prevention Research (co-PI and co-Director after 9/1/08)
- 9/2006-6/2012 Chair, Department of Environmental Health Sciences, University of Michigan School of Public Health
- 9/2006-2012 Director, Occupational Epidemiology Core, NIOSH Education and Research Center, University of Michigan
- 9/2006-2012 Co-Director, Michigan-Harvard/Harvard-Michigan Metals Epidemiology Research Group
- 7/2009-2011 Director, NIA T32 Training Grant in Aging and Public Health, University of Michigan School of Public Health
- 1/2010-2012 Chair, Faculty Steering Committee on Global Health, University of Michigan School of Public Health
- 4/2011-2012 (Founding PI) and Director, University of Michigan NIEHS P30 Core Center.
- 7/2012-2013 Director, Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario, Canada
- 7/2013-6/2017 Founding Dean, Dalla Lana School of Public Health, a Faculty of the University of Toronto, Toronto, Ontario, Canada

CLINICAL APPOINTMENTS:

- 7/1985-6/1987 Attending Physician, Emergency Department, Whidden Memorial Hospital
- 7/1985-6/1988 Assistant Visiting Physician, Department of Medicine, Boston City Hospital
- 1/1985-6/2006 Consultant in Occupational and Environmental Medicine, Center for Occupational and Environmental Medicine, Northeast Specialty Hospital (formerly known as the Olympus Specialty Hospital, the Massachusetts Respiratory Hospital, and Norfolk County Hospital).
- 3/1987-9/1987 Attending Physician, Occupational Health Program, University Hospital/Boston University Medical Center
- 7/1988-9/2006 Associate Physician, Brigham and Women's Hospital
- 7/1990-6/1995 Occupational/Environmental Medicine Consultant, Brigham and Women's Hospital Employee Health Services
- 7/2007-2012 Associate Physician, Division of General Medicine, Department of Medicine, University of Michigan Health System
- 1/2019-present Staff Physician, RotaClinic-Lake City, Seattle, WA

OTHER ACADEMIC POSITIONS and MAJOR VISITING APPOINTMENTS:

CV: Howard Hu, M.D., M.P.H., Sc.D.

7/1987-6/1990 Visiting Physician, South Cove Health Center, Boston (Chinatown)
 7/1996-8/2006 Associate, Center for Health and the Global Environment, Harvard Medical School
 2/1997 Alice Hamilton Visiting Professor, Division of Occupational and Environmental
 Medicine, Department of Medicine, University of California at San Francisco
 11/2000- Visiting Scientist, Sri Ramachandra Medical College and Research Institute
 7/2010- Senior Consultant, Tianjin Centers for Disease Control and Prevention, Tianjin,
 China
 10/2012- Visiting Professor, Shanghai Key Laboratory of Children's Environmental Health,
 Xinhua Hospital, Shanghai Jiao-Tung University, China
 7/2013-6/2016 Visiting Professor, Shanghai Jiao Tong School of Medicine, China
 5/2015- Affiliate Scientist to the Li Ka Shing Knowledge Institute, St. Michael's Hospital,
 Toronto, Canada

MAJOR RESEARCH INTERESTS:

1. Environmental and molecular epidemiologic research related to heavy metals, potential endocrine disruptors, other neurotoxicants, carcinogens, etc.
2. Gene-environment interactions; epigenetic dysregulation
3. Fetal/early life exposures and long-term effects
4. Aging-environment interactions
5. Environmental health, health inequities and health disparities, human rights
6. Health and the global environment
7. "Big Data" for population health
8. Environmental sensitivities/Multiple chemical sensitivities

GRANTS (as PI, Co-PI, or primary mentor only):

Past Funding:

1980 (summer) Montefiore Hospital, Bronx NY, PI; \$2,000 (approx)
 A study of rural and occupational health in Tulua, Colombia, South America
 1982 (summer) Albert Einstein College of Medicine, PI; \$3,000 (approx)
 A study of occupational/environmental health in Shanghai, China
 7/1987-6/1989 NIEHS Center Grant ES00002 Pilot Project, PI; \$12,000
 The Long-term Renal and Neurologic Effects of Childhood Plumbism
 7/1989-6/1990 NIEHS subcontract 7083-1, PI; \$50,000 (approx)
 The Use of X-Ray Fluorescence to Measure Lead Burden and Childhood Lead
 Exposure
 7/1990-6/1992 Agency for Toxic Substances and Disease Registry, PI; \$150,000 (approx)
 "Clinical Environmental/ Occupational Medicine Research Fellowship Award",
 7/1990-6/1991 NIEHS Center Grant ES00002 Pilot Project, PI; \$12,000
 The Metabolic Effects of Pregnancy and Lactation on Lead Burden

CV: Howard Hu, M.D., M.P.H., Sc.D.

7/1990-6/1991 Harvard School of Public Health Basic, PI
Research Support Grant; \$10,000
K-X-Ray Fluorescence Measured Lead Burden

10/1991-11/1991 NIOSH Special Grants, PI; \$50,000 (approx)
The Carpenters Lead Project

4/1991-3/1996 NIEHS/R01, PI; \$2,200,000 (approx)
The Epidemiology of Lead, Diet and Blood Pressure

7/1991-6/1996 NIEHS/R01 supplement, PI; \$240,000 (approx)
The Epidemiology of Lead, Diet and Blood
Pressure--Research Supplement for Minority Investigator

7/1992-6/1995 NIEHS/R01 (Office of Research on Women), PI; \$200,000 (approx)
Lead and Hypertension in Women

7/1993-6/1996 NIEHS/subcontract, PI; \$150,000 (approx)
Exposure to Neurotoxins as Risk Factors for Amyotrophic Lateral Sclerosis

7/1995-6/1998 State of Washington, Department of Labor, PI; \$350,000 (approx)
SPECT Imaging of the Brain in Patients with Multiple Chemical Sensitivity
Syndrome and Controls

7/1996-6/1997 NIEHS Center Grant ES00002 Pilot Project, PI; \$15,000
Electrocardiographic abnormalities in association with low-level lead exposure
among middle-aged to elderly men: the Normative Aging Study

4/1995-3/2000 NIEHS Project PI (Program Project PI: Richard Monson); \$1,800,000 (approx)
Lead Exposure, Accumulation in Bone, and Reproductive Toxicity Among Men and
Women In Mexico

4/1995-3/2000 NIEHS Project PI (Program Project PI: Richard Monson); \$1,900,000 (approx)
Lead Exposure, Accumulation in Bone, and Cognitive Toxicity Among Elderly Men
and Women

6/1997-5/2002 NIEHS/R01 ES05257 PI; \$2,312,274
Lead Biomarkers, Aging, and Chronic Disease

7/1997-6/1999 NIEHS Center Grant ES00002 Pilot Project, PI; \$10,000
The effect of genetic polymorphisms of metallothionein-IIA on mRNA levels in
middle-aged to elderly men: the Normative Aging Study

7/1998-6/2003 NIEHS/R01 PI (with no-cost extension; 5R01ES007821); \$2,291,833
Lead Dose Biomarkers, Reproduction, and Infant Outcomes

7/1999-6/2000 NIEHS Center Grant ES00002 Pilot Project, co-PI; \$14,000
Magnetic Resonance Spectroscopy in the Evaluation of Lead Neurotoxicity: the
Normative Aging Study

7/2000-6/2001 MAVERIC (Massachusetts Area Veterans Epidemiology Resource and Institute
Center) Pilot Project PI (with Dr. Robert Wright, co-PI); \$10,000
The Use of Magnetic Resonance Spectroscopy in Lead Poisoning

7/2000-6/2001 NIOSH Center Grant Pilot Project, PI (with Dr. Robert Wright, co-PI); \$12,000
Interaction between ApoE Genotype and Lead Exposure in the Development of
Cognitive Impairment

7/2002-6/2004 The Rasmussen Foundation/Health Care Without Harm; \$50,000

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

7

- Medical Use of Phthalate Containing Products in the Neonatal Intensive Care Unit and Biomarkers of Neonatal Phthalate Metabolites
7/2002-6/2003 NIEHS Center Grant Pilot Project, PI; \$8,000
Vitamin D Receptor Gene and Bone Lead in Reproduction
- 3/2004-2/2005 The Critelli Family Foundation; \$10,000
Review of Environmental Cadmium Exposure and Toxicity
- 4/2000-3/2007 NIEHS Project Leader (Program Project PI: Richard Monson; 5P01ES05947); \$2,472,677; Controlled Trial in Pregnancy of Dietary Supplements for the Suppression of Bone Resorption and Mobilization of Lead into Plasma (no cost extension)
- 4/2000-3/2007 NIEHS Project co-Leader (Program Project PI: Richard Monson; 5P01ES05947); \$1,210,000 (approx); A Community-Based Study of Lead Exposure Pathways, Biomarkers of Dose, Health Effects, and Phytoremediation Strategies at the Tar Creek Superfund Site (no cost extension)
- 4/2002-9/2007 NIEHS/R01 PI (5R01ES010798); \$3,011,295
Gene-Metal Interactions and Parkinson's Disease
- 10/2003-9/2007 NCMHI/P20 Project Leader (MD000501-01; Hughes Harris, PI); \$828,781 (Project)
"FAMU and Harvard Center for Health and Health Care Disparities"
- 8/2003-7/2008 NIEHS/R01 PI (2R01ES05257-11A2); \$3,357,424 (became co-PI in 2007 after move to University of Michigan)
Lead-Gene Interactions and Cognition
- 6/2004-3/2009 NIEHS/P01 PI (5 P01ES012874-01); \$6,662,670 (became co-PI in 2006 after move to University of Michigan)
Metals Mixtures and Children's Health (Center for Children's Environmental Health and Disease Prevention Research)
- 7/2002-12/2009 NIH/R03 PI (1R03TW005914; no cost ext through 2008); \$192,000 (approx)
Lead, Genes, and Cognition in Children in Chennai, India
- 9/2006-7/2011 NIEHS/R01 PI (R01ES0007821); \$3,116,831
Fetal Origins of Neurobehavior: Lead and Cholesterol Metabolism Interactions
- 7/2006-6/2011 NIEHS/R01 co-PI (R01ES013744; PI Wright), \$3,200,000
Stress, Lead, Iron Deficiency and Neurodevelopment
- 7/2006-6/2011 NIEHS/R01 co-PI (R01ES014930; PI Wright), \$2,800,000
Metal Mixtures and Neurodevelopment
- 2/2008-2/2010 Michigan Institute for Clinical and Health Research (MICHHR; home of the UM CTSA; UL1RR024986) Pilot Project PI; \$26,000 (no cost extension)
Epigenetics of Early Life Events and Environmental Toxicants
- 4/2009-4/2010 Michigan Alzheimer's Disease Research Center Pilot Project PI, \$25,000
Environment, Epigenetics and Alzheimer's Disease (no cost extension)
- 12/2009-12/2010 University of Michigan Center for Global Health Pilot Project PI, \$25,000
Climate Variability and Impacts on Mortality and Morbidity in Chennai, India: A Pilot Project Stemming from the 2009 U.S.-India Workshop on Climate Change and Public Health, Goa India (no cost extension)

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

TEACHING:

1. LOCAL CONTRIBUTIONS (at the Harvard School of Public Health, 1985-2006)

1985-	“Toxicology of the Kidney and Urinary Tract” Guest Lecturer for TOX204a,b
1988-	“Occupational Health” Guest Lecturer for EH201a,b
1989-1992	“Lead Toxicology” Guest Lecturer for TOX204a,b
1990-	<u>Grand Rounds in Occupational/Environmental Medicine</u> Director
1990-2000	<u>Introduction to Occupational and Environmental Medicine (EH232c,d)</u> Course director, lecturer
1990-	“The Epidemiology of Lead Exposure, Dose, and Toxicity” Guest Lecturer for EPE215c,d and EPE215t
1990-	“Solvent toxicity” Fundamentals of Industrial Hygiene, Continuing Education Department
1992	"Current Research on Lead", Metals Epidemiology Research Group Seminar Presenter
1992	"Lead Poisoning Without a Known Source in a Hyperthyroid Patient" Case discussant, Grand Rounds in Occupational and Environmental Medicine
1992-	“Biological Markers of Lead Dose” Guest Lecturer, EHE280c,d
1994-	“Screening for Lead Toxicity” Guest lecturer, EPI227d
1994-	“Lead Exposure and Biological Monitoring” Guest Lecturer, ID263b
1994-	“Case Study: Lead” Guest Lecturer and Case Discussant, EH202d
1996-	<u>Introduction to Environmental Health (EH201b)</u>

- Course director and lecturer
 1997- Human Health and Global Environment Change (EH278a,b)
 Course Co-developer, Co-director, and lecturer

Hospital courses and Invited Teaching Presentations (Harvard-affiliated Hospitals)

- 1990 Guest Lecturer on Occupational Medicine
 Residency Program, Department of Medicine, Brigham and Women's Hospital
- 1994 Speaker, Grand Rounds; "Is Lead a Ticking Time Bomb?"
 Department of Obstetrics and Gynecology, Brigham and Women's Hospital
- 1994 Speaker, Grand Rounds; "Is Lead a Ticking Time Bomb?"
 Department of Medicine, Brockton V.A. Hospital
- 1994 Speaker, Symposium on Preventive Medicine and Clinical Epidemiology,; "Is Lead a Ticking Time Bomb"; Brigham and Women's Hospital
- 1995 Discussant, "Multiple Chemical Sensitivity", Occupational/Environmental Medicine
 Grand Rounds, Occupational Health Program, Harvard School of Public Health
- 1996 Guest lecturer, "Lead Toxicity as a Paradigm for a Regional and Global Health Hazard", Environmental Health Student Group, Holmes Society, Harvard Medical School
- 1997 Speaker, "Mobilization of maternal bone lead as a hazard to the fetus", Grand Rounds, Dept. of Neonatology, Beth Israel Hospital, Boston, MA
- 2000 Guest lecturer, "Update on Lead Toxicity Research", Program in Pediatric Toxicology, Children's Hospital
- 2000 Discussant, "Adult Lead Toxicity", Weekly Case Round, Department of Medicine, Brigham and Women's Hospital, Boston.
- 2000 Lecturer, "Update on Lead Toxicity, Hypertension, and Chronic Renal Failure", Renal Rounds, Division of Nephrology, Department of Medicine, Brigham and Women's Hospital, Boston.
- 2002 Lecturer, "Maternal Bone Lead as a Threat to Fetal Development", Program in Neonatology, Beth Israel-Deaconness Hospital, Boston, MA

Doctoral student committees

Dr. Ananya Roy	Sc.D. Environmental Health, '08
Dr. Elissa Wilker	Sc.D. Environmental Health, '09

Post-doctoral fellow mentor:

Dr. Marinelle Payton (Channing Lab), Dr. Susan Korrick (Channing Lab), Dr. Rokho Kim (Channing Lab), Dr. Viji Potula (HSPH Research Fellow), Dr. Barbara Nowak (Visiting Scientist from Silesian University School of Medicine, Poland), Dr. Robert Wright (Channing Lab), Dr. Ming Tsuang Wu (HSPH Research Fellow), Dr. Yawen Cheng (Channing Lab), Dr. Geeta Mathur (neonatology fellow at the Brigham and Women's Hospital), Dr. Sri Hari Bojja (HSPH Research Fellow), Dr. Hae-Kwan Cheong (Visiting Scientist from Dongguk University School of Medicine, S. Korea), Dr. Sahar Elmarsafawy (HSPH Research Fellow), Dr. Jing Lu (Visiting Scientist from the Chinese Academy of Preventive Medicine), Dr. Dieter Affeln (Occ/Env Med Fellow), Dr. Ahmed Gomaa (Occ/Env Med Fellow), Dr. Chris Leffler (Occ/Env Med Fellow), Dr. Ronald Dykeman (Occ/Env Med Fellow), Dr. Uma Dhanabalan (Occ/Env Med Fellow), Dr. Hsien-Wen Hsu (Occ/Env Med Fellow), Dr. Betty Ann Cohen (Occ/Env Med Fellow), Dr. Arvin Chin (Occ/Env Med Fellow), Dr. Daniel Rhodes (Occ/Env Med Fellow), Dr. Richard Wittman (Occ/Env Med Fellow), Dr. Sun-Dong Lee (Visiting Scientist from Sangji University, Korea), Dr. Ronald Green (Occ/Env Med Fellow), Dr. Erma Lawson (Environmental Health Fellow), Dr. Marc Weisskopf (Environmental Health Fellow), Dr. Bridget Bagert (Occ/Env Med Fellow), Dr. John Jarrell (Visiting Scientist from University of Calgary), Dr. Jennifer Weuve (Environmental Health Fellow), Dr. Karen Chou (Visiting Scientist from Michigan State), Dr. Nitin Jain (Channing Laboratory Fellow), Dr. Adrienne Ettinger (Children's Center Scientist), Dr. Sam Myers (Fellow in Alternative and Complementary Medicine), Dr. Marcelo Targino (Occ/Env Med Fellow), Dr. Manish Arora (Post-doctoral fellow from University of Sydney), Dr. Huiling Nie (Post-doctoral fellow from McMaster University).

Other faculty mentorship:

Elizabeth Rubinstein (HMS Summer research), Alicia Marier (HMS Summer research), Vanitha Janakiraman (HMS Summer research), Young-Sook Lim (Harvard College Summer research), Charles Lin (Harvard College Senior thesis research), Ed Hsieh (Harvard College Summer research), Naveen Thomas (Emory University Medical School Senior thesis research), Shreekrishna Akilesh (Harvard Dental School summer research), Christine Pace (HMS Summer research)

Advisory and supervisory responsibilities

1985-1987 Attending Physician, outpatient general medicine clinic, Boston City Hospital; weekly precepting for housestaff and medical students

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

15

- 1990-2006 Preceptor, Residency in Occupational and Environmental Medicine, Harvard School of Public Health at the Mass Respiratory Hospital
- 1990-2006 Advisor to general M.P.H. students, Harvard School of Public Health.

2. LOCAL CONTRIBUTIONS (at the University of Michigan, 2006-2012)

- 2006- Principles of Environmental Health (EHS-500)
Course director and lecturer
- 2006- Environmental Epidemiology (EHS-608)
Guest lecturer on birth cohorts and environmental epidemiology
- 2006- Occupational and Environmental Disease (EHS-501)
Guest lecturer on metals exposure and health effects; Course Director (2009-)
- 2007- Metals Exposure, Biomarkers and Toxicity: A Multi-disciplinary Environmental Epidemiology Approach (EHS-698 reading course)
Course director and lecturer
- 2008-2009, Topics in Environmental Health Sciences (EHS-688)
2010-2011 Course director and lecturer
- 2009 Occupational and Environmental Disease (EHS-501)
Course director and lecturer
- 2009- On-line (Long-distance Foundations in Public Health Certificate Program): Principles of Environmental Health (EHS-500-801)
Course director and lecturer
- 2009 Introduction to Public Health (HMP-200)
Guest lecturer on environmental health
- 2009- Seminars in Aging and Public Health (EPID 813)
Course director and lecturer
- 2011 Seminar on Public Health in China (HMP-xxx)
Guest lecturer on “Environmental Health in China”

Post-doctoral fellow mentor:

Dr. Sung Kyun Park (Environmental Health Sciences Fellow, now Research Assistant Professor), Dr. Brisa Sanchez (Biostatistics Research Assistant Professor, now Assistant Professor), Dr. Richard Pilsner (Robert Wood Johnson Health & Society Fellow), Dr. Aimin Zhang (Environmental Health Sciences Fellow, Toxicology Training Grant), Dr. Ananya Roy (Environmental Health Sciences Fellow), Dr. David Cantonwine (Reproductive Sciences Fellow).

Doctoral Student Advisor (principal)

- | | |
|------------------|---|
| David Cantonwine | Ph.D. Environmental Health Sciences (2009) |
| Myriam Afeiche | Ph.D. Environmental Health Sciences (co-mentor with Karen Peterson; 2010) |
| Yoon-Hyeong Choi | Ph.D. Environmental Health Sciences (co-mentor with Sung Kyun Park; 2011) |

Katie F. Bush	Ph.D. Environmental Health Sciences (co-mentor with Marie O'Neill; 2011)
Kelly Bakulski	Ph.D. Environmental Health Sciences (2012)
Gamola Fortenberry	Ph.D. Environmental Health Sciences (co-mentor with John Meeker; 2013)
Siyang Huang	Ph.D. Environmental Health Sciences (2013)
Deena Thomas	Ph.D. Environmental Health Sciences (2014)
Rebecca Tutino	Ph.D. Environmental Health Sciences (2015)
Zishaan Farooqui	Ph.D. MD-PhD Medical Scientist Training Program (2015)

Masters Student Thesis Advisor

Bradley Lampe (OEE), Troy Meissner (OEE), Pheba Alexander (OEE), Brian Davis (OEE & HBHE), Aaron Leftwich (OJOC program), Suengwon Lee (Nutrition), Allen Zhong (OEE), Graham Newman (OEE), Jacqueline Barkoski (OEE)

Undergraduate Thesis Advisor

Lauren Schwartz (Neuroscience, LSA)

3. LOCAL CONTRIBUTIONS (at the University of Toronto, 2012-present)

2012	Determinants of Community Health (Faculty of Medicine) Guest lecturer on 'The Future of Medicine & Public Health in a Crowded, Diverse, Aging, Stratified, Urbanized, Polluted, Hot, Thirsty, Hungry, Debt-Ridden World'.
2012-	CHL5004H Introduction to Public Health Guest lecturer on "The Future of Public Health (and Your Role !) in a Hot, Flat, Crowded...and Diverse, Aging, Stratified, Urbanized, Polluted, Thirsty, Hungry, Debt-Ridden World". "What is Public Health?", "Climate Change and Health"
2012-	CHL 5912F Industrial Toxicology. Guest lecturer on the "Toxicology of Metals".
2013-2014	Department of Family & Community Medicine "Building Blocks" (short course for International post-graduate primary care trainees); Guest lecturer on "Public Health & Primary Care"
2013-	CHL5701H Doctoral Seminar, Collaborative Doctoral Program in Global Health Guest lecturer on "The Challenges of Environmental Health in a Rapidly-Changing World, from the Molecular to the Global".
2014	JCR1000 "Interdisciplinary Approach to Global Challenges" Guest lecturer on "Global Environmental Health"
2014-	PHS100H1 "Grand Opportunities in Global Health"; Guest lecturer on "Urban Environments"
2015	Public Health & Preventive Medicine Residency Rounds "Physicians, Climate, and other Global Environmental Changes: Our Role"
2016	<u>CHL5004H Introduction to Public Health, Course Co-Director (with Professor Erica</u>

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

17

- 2016 DiRuggiero)
CHL 7001H F6 Environmental-Molecular Epidemiology, Course Co-Moderator (with Professor Morteza Bashash)
- 2016 CHL5701H Doctoral Seminar, Collaborative Doctoral Program in Global Health, Course Co-Director (with Professors Erica DiRuggiero and Abdallah Daar)
- 2016 Joint Seminar, “The Impact on Intelligence, Behaviour, and Society of Lead Exposure: A Case Study of a Global Pollutant and On-going Research”; Collaborative Program in Neurosciences and Collaborative Global Health Doctoral Program, University of Toronto
- 2016 CHL5420H “Global Health Research Methods”
 Guest lecturer on “The Early Life Exposures in Mexico to Environmental Toxicants Project (ELEMENT): A Global Health Collaboration Case Study”

Masters student research advisor

Maele Marchand

Doctoral student advisor

Adele Carty

Doctoral student thesis committee member

Laura Bogaert

Doctoral student thesis examination committee member

Claudie CY Wong (doctoral student in epidemiology, Jockey School of Public Health and Primary Care, Chinese University of Hong Kong)

Zilong Zhang (doctoral student in epidemiology, Jockey School of Public Health and Primary Care, Chinese University of Hong Kong)

Post-doctoral fellow mentor:

Siyang Huang, Ph.D.; Morteza Bashash, Ph.D.; Roman Pabayo, Sc.D. (Harvard School of Public Health); Tripler Pell, M.D., M.P.H.

4. LOCAL CONTRIBUTIONS (at the University of Washington, 2017-present)

Doctoral student thesis research mentor

Megan Suter

Doctoral student special projects advisor

Rachel Shaffer

Joey Frostad

Rebecca De Buen

5. NIH K-grant mentorship:

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

18

Robert Wright, M.D., M.P.H. (K-23 ES000381, “*Neurochemical and Genetic Markers of Lead Toxicity*”), 2000-2005; Dr. Wright is now Prof of Pediatrics, Mt. Sinai School of Medicine
 Marc Weisskopf, Ph.D. (K-01 ES012653, “*New Biomarkers of Neurotoxicity*”), 2004-2009; Dr. Weisskopf is now Associate Prof of Occup Health, Harvard Sch Public Health
 Sung Kyun Park, Sc.D. (K-01 ES016587; “*Environment, Novel Aging Outcomes, and Genetics*”), 2009-2014; Dr. Park is now Assistant Prof, Department of Epidemiology, University of Michigan Sch Public Health
 Emily Somers, Ph.D. (K-01 ES019909; “*Immune Dysfunction Associated with Early Life Heavy Metals Exposure*”), 2011-2016; Dr. Somers is now Associate Prof, Division of Rheumatology, Department of Internal Medicine, University of Michigan Medical School

COMMITTEE, ORGANIZATIONAL, AND VOLUNTEER SERVICE

National/International

1978-1982 Taskforce on Occupational and Environmental Health, Co-coordinator, Am Med Stu Assoc
 1989 Ad Hoc Study Committee, National Institute for Environmental Health Sciences Council
 1989-2006 Association of Occupational and Environmental Medicine Clinics (AOEC)-- (through the Northeast Specialty Hospital Center for Occupational and Environmental Medicine)
 1989-1990 Member, Relative Risk Reduction Strategies Committee, Science Advisory Board, U.S. Environmental Protection Agency
 1989-1992 Member, Board of Directors, Physicians for Human Rights, Boston, MA
 1991 National Institutes of Health, General Clinical Research Center Program, Site Visit Team
 1992- Member, National Advisory Committee, Physicians for Human Rights, Boston, MA
 1992 Special Study Section member (R3/S1/B3), National Institutes of Health
 1994 Ad Hoc Reviewer, National Institutes of Health, General Dental Research Center Program
 1994- Advisory Board, Institute for Energy and Environmental Research
 1994-1996 Associate, Project on Global Environmental Change and Health, Physicians for Social Responsibility
 1995 Ad Hoc Reviewer, National Institutes of Health, Diagnostic Radiology Study Section
 1996- Membor, Editorial Board, Health and Human Rights—an International Journal
 1995-1998 Advisory Committee, Consortium for Environmental Education in Medicine, Cambridge, MA.
 1996-1997 Reviewer, Agency for Toxic Substances and Disease Registry
 1997-1998 Program Committee, Annual Mtg, NIEHS Superfund Basic Research Group Centers
 1998-2013 (Founding) Medical Editor (1998-2004); Associated Medical Editor (2004-), Environmental Health Perspectives (official journal of NIEHS)
 2001 Ad Hoc Reviewer, National Institutes of Health, R-13 applications

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

19

- 2002-2006 External Advisory Committee, Program Project on Lead and Osteoporosis, University of Rochester
- 2003-2005 Member, Ad-Hoc Expert Panel to Form Medical Management Guidelines for Lead-Exposed Adults, (supported by NIOSH and AOEC)
- 2003-2009 Member, Working Group on Lead and Pregnancy, Advisory Committee on Childhood Lead Poisoning Prevention, U.S. Centers for Disease Control and Prevention
- 2004 Ad Hoc Reviewer, National Institutes of Health, K-23 applications
- 2004 Ad Hoc Reviewer, Draft of "Immunization Safety Review: Vaccines and Autism" Immunization Safety Review Committee, Institute of Medicine, National Academies of Science
- 2004 Finalist (one of 8), Search for Director, National Institute for Environmental Health Sciences, U.S. National Institutes of Health
- 2005 Member, Strategic Planning Conference, National Institute for Environmental Health Sciences, Research Triangle Park, NC
- 2006 Ad Hoc Reviewer, Draft of "Preterm Birth: Causes, Consequence, and Prevention" Committee on Understanding Premature Birth and Assuring Health Outcomes, Institute of Medicine, National Academies of Science
- 2006 Member, External Advisory Committee, NIEHS Center, University of Rochester
- 2007 Member, Ad Hoc Study Section, Special Emphasis Panel/Scientific Review Group 2007/05 ZES1 JAB-C (DI) (NIEHS Discover Centers)
- 2007-2010 Member, Board on Population Health and Public Health Practice, Institute of Medicine, National Academies, Washington DC.
- 2007 Member, Ad Hoc Review Panel, Centers of Excellence Program, Swedish Council for Working Life and Social Research.
- 2007-2008 Member, Search Committee for Director of Extramural Research, NIEHS
- 2007 Special Consultant, Ad Hoc Study Section, Special Emphasis Panel/Scientific Review Group 2008/01 ZAR1 CHW-G (NIAMS Arthritis Centers)
- 2008 Report Reviewer, Draft National Research Council Report, "The National Children's Study Research Plan: A Review", National Academies
- 2008 Report Reviewer, Draft National Research Council Report, "Gulf War and Health: Updated Literature Review of Depleted Uranium", Institute of Medicine, National Academies
- 2008-2009 Data Safety Monitoring Board, "d-Penicillamine Chelation in lead-poisoned Children—A Phase II/III Trial" (R01FD003361; PI: Michael Shannon)
- 2008 Subcommittee to review Draft Report on Bisphenol A, Science Board, Food and Drug Administration
- 2008 Planning Committee, International Symposium on the Environmental and Health Consequences of Metal Mining and Smelting
- 2008-2009 Co-Chair, Planning Committee, "Climate Change Impacts on Public Health in India", Workshop that took place in Goa, India in Aug-Sept 2009 co-sponsored by UM Center for Global Health, the US Centers for Disease Control and Prevention and the Indian Council for Medical Research

CV: Howard Hu

20

- 2008 Finalist (one of 2), Search for Director, National Institute for Environmental Health Sciences, U.S. National Institutes of Health
- 2009-2012 Member, Board on Environmental Studies and Toxicology, National Research Council
- 2009 Reviewer, NIH Challenge Grants, Special Emphasis Panel/Scientific Review Group 2009/10 ZRG1 GGG-F
- 2009-2010 External Member, Academic Program Review Site Visit Committee, Department of Environmental and Occupational Health Sciences, University of Washington School of Public Health
- 2010-2012 Member, External Advisory Committee, University of Rochester NIEHS P30 Core Center
- 2010 Member, Ad-hoc review committee, National Health Research Institutes of Taiwan, Special Emphasis Panel—NHRI-Kaoshiung Medical College Program Project on “: “Gene Environment Interaction in the Genesis of Asthma and Allergic Diseases”
- 2010-2012 Member, Advisory Board, Institute of Public Health, Florida Agricultural & Mechanical University, Tallahassee, FL
- 2011 Reviewer, NIEHS Career Development Awards, Special Emphasis Panel/Scientific Review Group 2011/05 ZES1 LKB-J (K9)
- 2011-2016 Member, NIEHS National Advisory Environmental Health Sciences Council
- 2012 Member, Editorial Board, Journal of Alzheimer’s Disease
- 2015 Member and External Reviewer, School of Population and Public Health Review Committee, University of British Columbia, Vancouver, B.C.
- 2016- Chair, Board of Directors, Canadian Urban Environmental Health Research Consortium, (National Consortium based out of the Dalla Lana School of Public Health)
- 2017- Member, Energy Research Committee, Health Effects Institute, Boston, MA
- 2017-2018 Executive Co-Chair, Workshop on the Global Burden of Disease-Pollution and Health Initiative, March 1-2, 2018, Institute for Health Metrics and Evaluation, Seattle, WA
- 2017- Executive Co-Leader, Global Burden of Disease-Pollution and Health Initiative
- 2019- Member, Research Advisory Committee, Centre of Environmental Health, The Public Health Foundation of India and the Tata Institute of Social Sciences, New Delhi, India
- 2019- Reviewer, draft report on trace metals levels in pregnancy women, Agency for Toxic Substances and Disease Registry, Centers for Disease Control and Prevention, Atlanta

Regional

- 1988-1990 Health Facilities Appeals Board, Member, Dept. Public Health, Comm. Of Mass.
- 1988-2006 Advisory Board, Massachusetts Department of Public Health, Sentinel Event Notification System for Occupational Risks (SENSOR) Project
- 1989-1995 Advisory Board, Massachusetts Division of Occupational Hygiene, Lead Registry Project
- 1990-1992 Board of Directors, Member, Health Care for All, Boston, Massachusetts
- 1993-1995 Faculty Council, Member, Harvard School of Public Health
- 1995-2006 Faculty Advisory Committee, Public Health Practice Program, Harvard School of Public Health

CV: Howard Hu, M.D., M.P.H., Sc.D.

21

1996-2006 Advisory Board, Boston VA Environmental Hazards Center, Boston

1997-2001 Faculty Steering Committee, Center for Children's Health, Harvard School of Public Health

1996-2006 Senior Epidemiology Consultant, Massachusetts Veterans Epidemiology Research and Information Center, Boston.

1996-2006 Associate, Center for Health and the Global Environment, Harvard Medical School

1997-2002 Faculty Advisory Committee on Continuing Professional Education, Harvard School of Public Health

1998-2006 Faculty Steering Committee, Masters of Public Health program, Harvard School of Public Health

2001-2003 Board of Directors, New England College of Occupational and Environmental Medicine

2001-2006 Associate Director, Harvard NIEHS Environmental Sciences Center, Harvard School of Public Health

2001-2006 Senior Advisory Council Member, Lowell Center for Sustainable Production, University of Massachusetts, Lowell, MA

2003-2006 Member, Human Subjects Committee, Harvard School of Public Health

2003-2006 Advisory Committee, Occupational Health Services Research Program, Harvard School of Public Health

2006 Study Section Review Committee, Pilot Project Program, Graham Environmental Sustainability Institute, School of Natural Resources and Environment, University of Michigan

2006-2007 Chair, Planning Committee, Health Sector, May 8-10, 2007 National Summit on Coping with Climate Change, University of Michigan

2007-2009 Member, Advisory Committee, SPH Practice Committee, University of Michigan School of Public Health

2007-2012 Member, Residency Advisory Committee, General Preventive Medicine Residency, University of Michigan School of Public Health

2008-2009 Member, Steering Committee, NIA T32 Training Grant on Aging Research (PI: Mary Haan), University of Michigan School of Public Health

2008-2013 Member, Advisory Committee, Outstanding New Environmental Scientist Awardee (Marie O'Neill), NIEHS

2008-2009 Member, Search Committee for Director of the Risk Science Center, University of Michigan School of Public Health

2009 Co-Chair, Planning Committee, Workshop on Predicting and Preventing Climate Change Impacts on Public Health, Goa, India (Collaboration with the UM Center for Global Health, the US Centers for Disease Control and Prevention, and the Indian Council for Medical Research)

2009-2011 Director and PI, NIA T32 Training Grant on Aging Research, University of Michigan School of Public Health

2009-2010 Member, Planning Committee, University Research Corridor (U of M, Michigan State, Wayne State) symposium on environmental health sciences in January 2010

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

22

2009-2012 Faculty Associate, Center for Global Health, University of Michigan
 2009-2012 Member, Internal Advisory Board, Cancer Epidemiology Education in Special Populations Program, University of Michigan School of Public Health
 2009-2011 Chair, Steering Committee on Global Health, University of Michigan School of Public Health
 2010-2012 Member, Executive Committee, Graham Environmental Sustainability Institute, University Of Michigan
 2010-2012 Member, Committee on Diversity, University of Michigan School of Public Health
 2012-2017 Chair, Executive Committee, Dalla Lana School of Public Health, University of Toronto
 2012-2017 Chair, Tenure Committee, Dalla Lana School of Public Health, University of Toronto
 2012-2017 Chair, Decanal Promotions Committee, Dalla Lana School of Public Health, University of Toronto
 2012-2017 Chair, Executive Advisory Committee, Institute for Global Health Equity & Innovation, Dalla Lana School of Public Health, University of Toronto
 2013-2015 Interim Director, Institute for Global Health Equity & Innovation, Dalla Lana School of Public Health, University of Toronto
 2013-2014 Co-Chair, Research Committee, Dalla Lana School of Public Health, University of Toronto
 2014-2017 Chair, Executive Advisory Committee, Institute for Health Policy Management and Evaluation, University of Toronto
 2014 Chair, Ad-hoc Committee to create an Institute for Indigenous Health (based on a \$10 million endowment gift made to DLSPH), Dalla Lana School of Public Health, University of Toronto; Chair, Executive Advisory Committee beginning 2015
 2015-2017 Chair, Executive Advisory Committee, Joint Centre for Bioethics, University of Toronto
 2015- Chair (2015-2017); Member (2017-present), Taskforce on Environmental Health, Ministry of Health and Longterm Care, Province of Ontario
 2016-2017 Chair, Executive Advisory Committee, Centre for Critical Qualitative Health Research, University of Toronto
 2017-2018 Executive Co-Chair, Workshop on the Global Burden of Disease-Pollution and Health Initiative (a collaboration between the Global Alliance on Health and Pollution and the Institute for Health Metrics), Seattle, WA

Hospital

1982-1985 Occupational Safety and Health Committee, Member, Boston City Hospital, Boston
 1983-1984 House Officers Association, Treasurer, Boston City Hospital
 1984-1985 House Officers Association, Co-President, Boston City Hospital

OTHER PUBLIC SERVICE

1987 Member, Fact-finding tour on "The Health Effects of Massive Exposure to Tear Gas",

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

23

- Seoul, South Korea, July 11-18 (Sponsored by Physicians for Human Rights, American College of Physicians)
- 1988 Member, Fact-finding tour on "Chemical Weapons and the Iraqi Kurdish refugees", Turkey Oct 6-16 (Sponsored by Physician for Human Rights and the MacArthur Foundation)
- 1990 Leader, Fact-finding tour on "Health and Human Rights in Burma (Myanmar)", Thailand-Burma Dec. 26-Jan 6 (Sponsored by Physician for Human Rights and the MacArthur Foundation)
- 2009 Consultant and senior advisor, Fact-finding tour on "Mining and Potential Exposures and Health Effects in Guatemala", August 2009 (Sponsored by Physicians for Human Rights)

CONSULTING POSITIONS

- 1987-1989 Consultant, "In-Vivo Total Body Lead Analysis by X-Ray Fluorescence", NIH/SBIR Grant 2R44ES03918-02
- 1988-1989 Consultant, "Boston Area Health Coalition Demonstration Project", DHHS/MP000003-A1
- 1993-1995 Consultant, Employee Health Services, Brigham and Women's Hospital
- 1994 Consultant, Public Welfare Foundation, Washington, DC (review of Environmental Programs)
- 1997-2006 Consultant, Pediatric Environmental Health Center, Children's Hospital, Boston, MA
- 2000 Consultant, Doris Duke Foundation, New York, NY (review of potential Environment and Medicine programs)
- 2009-2010 Consultant and Member, Academic Program Review Site Visit Committee, Department of Environmental and Occupational Health Sciences, University of Washington School of Public Health, Seattle, WA
- 2011 Consultant, JPB Foundation, New York, NY (review of Environmental Health programs)
- 2014- Advisor, Hearing Health Sciences, Ann Arbor MI and Amsterdam, Netherlands

VISITING PROFESSORSHIPS

- 1997 Alice Hamilton Visiting Professor, University of California at San Francisco
- 2000-2001 Visiting Professor, Sri Ramachandra Medical College & Research Institute, Chennai, India
- 2004 Visiting Professor, Department of Environmental Medicine, University of Rochester
- 2013 Visiting Professor, Shanghai Key Laboratory, Shanghai Jiao-Tung University

SEMINARS AND EXTRAMURAL INVITED PRESENTATIONS (last 15 years, since 2003; prior presentations upon request)

CV: Howard Hu, M.D., M.P.H., Sc.D.

CV: Howard Hu

24

- 2003 Guest lecturer, "Lead as a trans-generational toxin", Seminar series, Department of OB/GYN, Brigham and Women's Hospital
- 2003 Plenary speaker, "Clinical opportunities in environmental health", Annual Leadership Retreat, National Institute for Environmental Health Sciences, Greensboro, NC.
- 2003 Discussant, "Uncontrolled Hypertension in a Painter", Grand Rounds in Occupational/Environmental Medicine, Harvard School of Public Health
- 2003 Discussant, "A 53-Year Old Teacher with Chemical Sensitivities", Grand Rounds in Occupational/Environmental Medicine, Harvard School of Public Health
- 2003 Lecturer, "Pestilence and Progress: The Future of Public Health through the Lens of Blood", Center for Blood Research Symposium, Museum of Science, Boston, MA.
- 2003 Speaker, "Bones, Genes, Plasma, and Lead: New Frontiers in Understanding the Toxicity of an Old Hazard", Distinguished Lecture Series. National Center for Environmental Health/Agency for Toxic Substances and Disease Registry, Centers for Disease Control and Prevention, Atlanta GA.
- 2003 Plenary speaker, "Biomarkers, Genes, Interactions and Lead: New Insights from Research on an Old Hazard", Superfund Basic Research Program Annual Meeting, Dartmouth University, Hanover, NH.
- 2003 Special Lecturer, "Lead Exposure and Chronic Disease: Recent Research on Susceptible Sub-populations", Florida Agricultural and Mechanical University, Tallahassee, FL.
- 2004 Speaker, "New Frontiers in Understanding the Toxicity of Lead", Department of Environmental Medicine, University of Rochester, Rochester, NY.
- 2004 Presenter, "Lead Exposure During Pregnancy: Mobilization of Maternal Bone Lead Stores and Their Threat to the Fetus", Semi-annual meeting of the Childhood Lead Poisoning Prevention Branch, Centers for Disease Control and Prevention, Baltimore, MD
- 2004 Presenter, "Environmental Medicine", Annual meeting of the Editorial Board, *Environmental Health Perspectives*, Baltimore MD
- 2004 Plenary speaker, "Metals, Genes, and Neurodegeneration: the Approach of the Metals Epidemiology Research Group at the Harvard School of Public Health", National Institute for Environmental Health Sciences Conference on Neurodegeneration.
- 2004 Discussant, "Suspected Lead Toxicity" Grand Rounds in Occupational/Environmental Medicine, Harvard School of Public Health
- 2004 Discussant, "Mercury Exposure in a Metal Worker", Grand Rounds in Occupational/Environmental Medicine, Harvard School of Public Health
- 2004 Presenter, "Effects of Our Environment on Intellect, Behavior, Life and Death," Leadership Council meeting, Harvard School of Public Health
- 2004 Guest Speaker, "Biomarkers, Genes, Interactions and Lead: New Insights from Research on an Old Hazard", Department of Environmental Health, University of Michigan School of Public Health
- 2004 Guest Speaker, "Medicine, Public Health, and the Great American Melting Pot: A Second-Generation Chinese-American Reflects on His Personal Odyssey", Sponsored by the Asian Student Association, Harvard School of Public Health
- 2004 Speaker, "Aging, the Environment and Genetics: Recent Insights from

- Epidemiologic Studies of Environmental Lead Exposure”, Annual Leadership Retreat, National Institute for Environmental Health Sciences, Pinehurst, NC.
- 2004 Plenary Speaker, “Guidelines for the Management of Lead-Exposed Adults: Recommendations by a National Expert Panel Based on Recent Research”, New England College of Occupational and Environmental Medicine Annual Meeting
- 2005 Lecturer, “Biomarkers, Genes, Interactions and Lead: New Insights from Research on an Old Hazard”, Sri Ramachandra Medical College and Research Institute, Chennai, Tamil Nadu, India
- 2005 Lecturer, “Your Child's IQ, Behavior and Neuropathology: Genes or Environment?”, the Harvard Club of Boston, Boston, MA
- 2005 Guest Speaker, “Metals, Neurodevelopment, and Neurodegeneration: The Work of the Metals Epidemiology Research Group at HSPH”, Neurostatistics Working Group, Harvard School of Public Health, Boston, MA.
- 2005 Plenary Speaker, “Aging, the Environment and Genetics: Recent Insights from Epidemiologic Cohort Studies of Environmental Lead Exposure”, NIEHS Symposium on Aging and the Environment, Duke University, Durham, NC.
- 2005 Plenary Speaker, “SPECT Imaging and Chemical Intolerance”, NIEHS/NIAA symposium on “Chemical Intolerance and Addiction: a Shared Etiology?”, Research Triangle Park, NC
- 2005 Workshop Presenter, “Social and Environmental Threats: the Unnecessary Epidemics”, Harvard School of Public Health Leadership Council Annual Conference, Boston, MA
- 2005 Keynote Speaker, “Our Food, Our Water, Our Homes: Toxic Metals”, The Boston Foundation, Boston, MA.
- 2006 Invited Speaker (invited by David Schwartz, NIEHS Director), “Goal IV: Improve and Expand Community-Linked Research”, Roundtable on Environmental Health Sciences, Research, and Medicine; Institute of Medicine, National Academy of Sciences, Wash DC.
- 2006 Speaker, “The Future of Environmental Health Sciences at the University of Michigan”, Dean’s Advisory Board, University of Michigan School of Public Health, Ann Arbor, MI
- 2006 Keynote Speaker and Harriett Hardy Annual Lecturer, “The ‘E’ in Occupational/ Environmental Medicine: the Present and the Future”, New England College of Occupational Medicine Annual Meeting, New Bedford, MA
- 2007 Speaker, “The Future of Environmental Health Sciences at the University of Michigan”, Meetings of the UMSPH Alumni Council and the EHS Emeritus Faculty, Ann Arbor, MI
- 2007 Moderator and Speaker, “The Normative Aging Study: Health Effects of Lead”, Symposium on the Health Effects of Lead, 2007 Annual Meeting of the International Society for Environmental Epidemiology, Mexico City, Sept 8, 2007
- 2007 Guest Lecture, “Uncovering the Impact of the Environment on Disease: Big Opportunities for Physician-Scientists”, Medical Scientist Training Program, University of Michigan Medical School
- 2007 Guest Lecture, “Industrialization, Pollution and Public Health in India: Can India Survive Modernization?”, Osher Institute, Ann Arbor, MI
- 2007 Plenary Speaker, “Environmental Equity: Local and Global Challenges and the Balance Between Research and Advocacy”, Michigan’s Premier Public Health Conference,

- October 16, 2007, Dearborn, MI
- 2007 Board Member Lecture, "Metals, Genes, Health and Human Rights: from the Molecular to the Global", Fall Meeting of the Board of Population Health and Public Health Practice, Institute of Medicine, National Academies of Science, Washington DC, Dec 13, 2007.
- 2008 Speaker, "MDs as Leaders for Change in Environmentalism", 2008 Annual Regional Political Leadership Institute, American Medical Student Association, University of Michigan Medical School, February 16, 2008
- 2008 Speaker, Grand Rounds, "The Impact of Environmental Pollutants on Disease: New Insights and Implications for Research and Medical Practice" Department of Medicine, University of Michigan Health System.
- 2008 Guest Lecture, "Emerging Insights into the Pervasive Influence of Environment Toxicants on Reproductive Outcomes and Offspring Development: Lead as a Case Study", Reproductive Sciences Program, University of Michigan
- 2008 Panelist, "Environmental Health in China", Public Health Grand Rounds, Division of Health Practice, University of Michigan School of Public Health
- 2008 Keynote Speaker, "Human Health and the Role of Water", Symposium on Water, Health & The Environment, Graham Environmental Sustainability Institute, University of Michigan
- 2008 Guest Speaker, "Lead Exposure and Toxicity: New Insights Using Molecular Epidemiology" Wadsworth Laboratories and SUNY-Albany
- 2008 Speaker: "Impact of Climate Change on Human Health: Vulnerability" 5th AKKA World Kannada Conference, Chicago IL
- 2008 Speaker, "The 'E' in Occupational/Environmental Medicine: the Present and the Future", Michigan Occupational/Environmental Medicine Annual Meeting, Mackinac Island, MI
- 2008 Speaker, "Impact of Climate Change on Human Health", University of Michigan Chapter of the American Medical Student Association, Ann Arbor, MI
- 2008 Speaker, "Early Life Origins of Adult Chronic Disease: Environmental Health and Toxicology at a Crossroads" Michigan Chapter of the Society for Toxicology, Ann Arbor, MI
- 2009 Speaker, "Evidence for Lead as an Environmental Stressor of Alzheimer's Disease and the Role of Epigenetics", Symposium Panel, Annual Meeting of the Society for Toxicology, Baltimore, MD
- 2009 Keynote Speaker, "Lead, Late-Life and Early Life Effects, and the Emerging Field of Environmental Epigenetics: Looking Ahead", Annual Meeting of the American College for the Advancement of Medicine, San Diego, CA
- 2009 Speaker, "Lead Toxicity and Mechanistically-Oriented Molecular Epidemiology: Targeting the Epigenetics of Alzheimer's Disease", Seminar Series, Institute for Environmental Health Sciences, Wayne State University, Detroit, MI
- 2009 Speaker, "Climate Change Impacts on Health in the Developing World", Research Discussion Series, University of Michigan Center for Global Health
- 2009 Speaker, "Autism, Aggressive Behavior, Anxiety, and Alzheimer's: are Environmental Toxicants Playing a Major Etiologic Role?", Department of Psychology, University of Michigan
- 2009 Speaker, "Early Life Exposures and Endocrine Disruption: Evidence from Molecular

- Epidemiology”, Pediatric Endocrine Seminar, University of Michigan Medical School
- 2009 Distinguished Speaker, “Lead Toxicity: Twenty Years of Research On The Poison That Keeps on Poisoning” 10th Anniversary of the Department of Microbiology and Environmental Toxicology, University of California at Santa Cruz
- 2010 Speaker, “The Centers for Disease Control and Prevention & the Environmental Protection Agency: Potential Funding Opportunities for Regional Collaboration in Michigan”, University Research Corridor Symposium on Environmental Health, Detroit, MI.
- 2010 Speaker, “The Future of Public Health”, University of Washington School of Public Health
- 2010 Speaker, “The Environment Meets the Epigenome: Is This Where Autoimmunity Begins?” Symposium on Autoimmunity and Epigenetics, University of Michigan
- 2010 Keynote Speaker, “A New Twist to an Old Story: The Evidence for Early Life Lead Exposure as a Risk Factor for Alzheimer's Disease through Epigenetic Programming”, NIEHS Environmental Health Sciences Center and Toxicology Training Program Retreat, University of Rochester, NY
- 2010 Speaker, “Lead Toxicity: Twenty Years of Research on The Poison That Keeps on Poisoning” and “Environmental Health Sciences at the University of Michigan”, Tianjin Centers for Disease Control, Tianjin, China
- 2010 Speaker, “Pediatric Lead Toxicity”, Xinhua Hospital and the Shanghai Jiao-Tung Medical University Department of Pediatrics, Shanghai, China
- 2010 Speaker, “Environmental Health Sciences at the University of Michigan”, Fudan University, Shanghai, China
- 2010 Speaker, “Alzheimer’s Disease, Epigenetics and the Environment”, Symposium Update, Alzheimer’s Disease Association, Ann Arbor, MI
- 2010 Speaker, “Environmental Justice, Progress (and the Lack Thereof) and the Role of Research”, Roundtable on Environmental Health Sciences, Research and Medicine, Institute of Medicine, National Academies, Washington DC.
- 2010 Speaker, “White Coats, Population Science and Poison Gas: A Life Spent at the Intersection of Academic Medicine, Global Health & Human Rights”, Robert Wood Johnson Clinical Fellows Program, University of Michigan Medical School, Ann Arbor, MI
- 2011 Speaker, “The Three Most Difficult Challenges to Molecular Epidemiologic Research on Gene-Environment Interactions: Lead Toxicity as a Case Study.” Department of Human Genetics, University of Michigan Medical School, Ann Arbor, MI
- 2011 Speaker, “The Integration of Data on Environmental Carcinogens with Population and Genetic Resources”, “Opportunities & Challenges for Translational Research on Cancer Prevention”, Translational Cancer Prevention & Biomarkers Workshop, Mazamdur-Shaw Cancer Center, Bangalore, India.
- 2011 Speaker, “Success in the Academy”, Faculty Panel, Students of Color of Rackham, Rackham Graduate School, University of Michigan
- 2011 Speaker, “White Coats, Population Science and Poison Gas: Fact-Finding Missions by Health Professionals for Human Rights”, Sujal Parikh Memorial Symposium, University of Michigan Medical School.
- 2011 Speaker, “The Analysis of Biomarker Data to Ascertain the Contribution of Environmental

- Exposures to the Etiology of Disease: Lead Exposure and Toxicity as a Case Study”, Department of Computational Medicine and Bioinformatics, University of Michigan Medical School.
- 2012 Speaker, “Research and Analysis Linking Upstream and Downstream Disparities Work”, Webinar hosted by the Health & Environmental Funders Network, Bethesda, MD, with 52 Foundations related Health.
- 2012 Keynote Speaker, “The Future of Public Health & Medicine in a Crowded, Diverse, Stratified, Hot, Urbanized, Polluted, Thirsty, Hungry and Debt-Ridden World”. E.J. Van Liere Memorial Convocation and Health Sciences Center Research Day, West Virginia University, Morgantown, West Virginia
- 2012 Plenary Speaker, “Transgenerational Impacts of Pollutants on Offspring: Recent Insights and Case Studies”, Connaught Global Challenge International Symposium, University of Toronto.
- 2012 Speaker, “Environmental Impacts on Aging (+ an update on the Dalla Lana School of Public Health)”, Community Medicine Rounds, University of Toronto
- 2012 Speaker, “The Environment & Public Health in a Research-Intensive University: Opportunities for Scholarship in a Crowded, Diverse, Stratified, Hot, Urbanized, Polluted, Thirsty, Hungry and Debt-Ridden World”, School for the Environment, University of Toronto
- 2012 Speaker, “Big Public Health Challenges (& Opportunities) in a Crowded, Diverse, Aging, Stratified, Urbanized, Polluted, Hot, Thirsty, Hungry, Debt-Ridden World”, External Advisory Meeting, Public Health Ontario, Toronto
- 2012 Speaker, “Canadian Public Health Schools (in a Crowded, Diverse, Aging, Stratified, Urbanized, Polluted, Hot, Thirsty, Hungry, Debt-Ridden World): The View from Toronto, External Advisory Board Meeting, Institute for Population and Public Health, Canadian Institutes for Health Research, Toronto
- 2012 Speaker, “Sustainable Development and Health: The Global Mining Industry”, Canadian Society for International Health Annual Meeting, Ottawa
- 2012 Speaker, “Big Public Health Challenges (& Opportunities) in a Crowded, Diverse, Aging, Stratified, Urbanized, Polluted, Hot, Thirsty, Hungry, Debt-Ridden World”, Xinhua Hospital/Shanghai Jiao-Tung University, Shanghai, China.
- 2012 Speaker, “The Impact of Population-Wide Lead Exposure and Gene-Lead Interactions on Chronic Disease”, Genetic Grand Rounds, Sick Kids Hospital, Toronto.
- 2012 Speaker, “Looking behind the curtain: Lead Toxicity as a Case Study of Methodologic Challenges in Gene-Environment Interactions Research”, Strategic Training in Advanced Genetic Epidemiology (STAGE), Dalla Lana School of Public Health, University of Toronto.
- 2012 Keynote speaker: “Public Health—the Next Frontier in Health Professions Education”. Council of Health Sciences annual retreat, University of Toronto.
- 2013 Speaker, “White Coats, Population Science and Poison Gas: Lessons from a Life Spent at the Intersection of Academic Medicine, Global Health & Human Rights”, Joint Center for Bioethics, University of Toronto
- 2013 Speaker, “Gauging environmental impact on the development of chronic inflammation”,

- Lana School of Public Health, Toronto, ON
- 2015 John Goldsmith Memorial Lecture: “Big Data, Environmental (and Social) Epidemiology, Power and Politics”, Opening Plenary Session, International Society for Environmental Epidemiology Annual Meeting, Sao Paulo, Brazil
- 2015 Inaugural Speaker: “The Future of Public Health and Medicine in a Crowded and Complex World”, Global Health Leadership Series, PSG Medical School & the Shanti Ashram Foundation, Coimbatore, Tamil Nadu, India
- 2016 Speaker “The Future of Public Health & Medicine in a Crowded, Diverse, Aging, Stratified, Urbanized, Polluted, Hot, Thirsty, Hungry, Debt-Ridden World”, Indian Institutes of Public Health—Hyderabad, Hyderabad, India
- 2016 Speaker: “Integration of Public Health & Health Care: The Unmet Agenda for a Truly Sustainable Health System”, Board of Directors Retreat, Toronto East General Hospital, Toronto
- 2016 Plenary speaker: “Health Promotion, Prevention and Health Protection: Innovative Initiatives”, 6th Asia-Pacific Conference on Public Health | 1st ASEAN Health Promotion Conference Bangkok, August
- 2016 Speaker: “Big Data, Environmental (and Social) Epidemiology, Power and Politics”, Mount Sinai School of Medicine, New York, NY
- 2016 Plenary Speaker: “The Impact of Environmental Toxicants on Health: Recent Epidemiologic Approaches & Advances”, International College of Integrative Medicine Annual Meeting, Toronto, ON
- 2016 Plenary Speaker: “Big Data and Implications for Environmental Health”, 15th Anniversary Conference, Jockey Club School of Public Health & Primary Care, Chinese University of Hong Kong, Hong Kong
- 2016 Plenary Speaker: “Innovations in Assessing Lead Poisoning and Child Health: Policy & Clinical Implications”, Chinese University of Hong Kong-Fudan-Oxford International Symposium on Health Impacts of Environmental Exposures”, Hong Kong
- 2016 Speaker: “Addressing a Changing Environment (and Impacts on Health, AKA Can India Survive Modernization?)”, Indian Institutes of Technology Alumni, Canada, International Conference 2016, Toronto.
- 2016 Plenary Speaker, “Hidradenitis Suppurativa: Research Directions from a Population Health Perspective”, Symposium on Hidradenitis Suppurativa Advances, Toronto.
- 2016 Plenary Speaker, “Children’s Environmental Health”, The 2016 Annual National Conference on Children’s Healthcare, Shanghai, China
- 2016 Special Guest Speaker, “Big Data, Environmental (and Social) Epidemiology, Power and Politics”, Shanghai Municipal Center for Disease Control, Shanghai, China
- 2016 Lecturer, “Lead and Human Health: Recent Research and Associated Lessons for Science & Policy”, Fudan University School of Public Health, Shanghai, China
- 2017 Lecturer, “The Impact of Environmental Toxicants on Health: Recent Epidemiologic Approaches & Advances”, Saw Swee Hock School of Public Health, National University of Singapore, Singapore
- 2017 Lecturer, “The Future of Academic Public Health”, Saw Swee Hock School of Public Health,

Chris Neurath
Research Director
Health Studies Project

1

I'm Chris Neurath and I'm the Research Director for the American Environmental Health Studies Project. I'm going to give an overview of the scientific evidence for fluoride's developmental neurotoxicity.

I'm going to start with some amazing and beautiful pictures ... and the question: What exactly is developmental neurotoxicity ... and why is it such a focus of current research on fluoride?

F neurotoxicity

Brain development is highly complex dynamic process

Brain Development

“The wiring of brains is *staggeringly complex*. Our own brains have tens of billions of neurons connected through perhaps one hundred trillion synapses. *This circuitry is the result of our development and experience*”

Harvard Center for Brain Science

Image of neurons engineered to express multiple fluorescent colors

Harvard Center for Brain Science

Brain development starts with a few cells in the early fetus and continues rapidly in a highly complex dynamic process through infancy. Indeed the rate of neurodevelopment in humans is extremely rapid in utero, but is even faster in the first months after birth. This formation of the wiring of our brains is “staggeringly complex” as described by the Harvard Center for Brain Science. “Our own brains have tens of billions of neurons connected through perhaps one hundred trillion synapses.”

F neurotoxicity

Brain development is highly complex dynamic process

Neurotoxicants can disrupt brain development in many ways

There are many critical processes during neurodevelopment, which all have to take place with precise timing and coordination with the other processes. A disruption from a toxic chemical to any process, even during a brief window of time, can cause permanent harm. Reduced IQ is one symptom of such harm.

F neurotoxicity

Brain development is highly complex dynamic process

The fetal and infant brain is more susceptible than the adult to permanent harm from neurotoxic chemicals.

- The complex precisely timed neurodevelopment process offers many opportunities for disruption.
- The blood brain barrier is not well developed during the fetal period and the first 6 months of life.
- Disruption during even a short window of neurodevelopment can cause life-long permanent harm.

The fetal brain and the infant brain is more susceptible to disruption than the adult brain because of this complex neurodevelopment process but also because the blood-brain barrier, which can limit access of toxic chemicals to the brain in adults, is not well developed until after age 6 months. Disruptions to neurodevelopment can cause life-long harm which often can not be repaired.

**National Toxicology Program (NTP)
draft systematic review and health assessment
of the neurotoxicity of fluoride:**

“Conclusions: NTP concludes that fluoride is presumed to be a cognitive neurodevelopmental hazard to humans. This conclusion is based on a consistent pattern of findings in human studies across several different populations showing that higher fluoride exposure is associated with decreased IQ or other cognitive impairments in children.”

The best place to start is with the recently released National Toxicology Program, or NTP, a systematic review of fluoride’s neurotoxicity. This was a very thorough review that has been 5 years in the making. They concluded that fluoride is a presumed neurotoxin.

F neurotoxicity

Large number
of studies

National Toxicology Program
U.S. Department of Health and Human Services

Systematic Review of Fluoride Exposure
and Neurodevelopmental and
Cognitive Health Effects

Figure 4. Study Selection Diagram

Their conclusion is based on a very large amount of evidence that would probably surprise most people who have not studied fluoride's adverse effects. The NTP identified 149 human studies and 339 laboratory animal studies.

F neurotoxicity

Large number
of studies

National Toxicology Program
U.S. Department of Health and Human Services

Systematic Review of Fluoride Exposure and
Neurodevelopmental and
Cognitive Health Effects

Figure 5. Number of Epidemiological Studies by Outcome and Age Categories*

Outcome Category	Age Category					
	Child	Adult	Child/Adult Combined	Infant	Fetus	
Intelligence (IQ)	60	3				
Learning/Memory	4	3		1		
Cognitive Development	2			1		
Cognitive Impairment		5				
Attention/Hyperactivity/Behavioral Issues	5					
Motor/Sensory Function or Development	2	4		1		
Mood/Affect		1				
Visual-Spatial/Visual-Motor Function	2	2				
Brain Activity		1				
Brain Structure					2	
Neurological Biochemical	2	1	1		1	
Neurological Complications of Fluorosis		3				
Neurological Symptoms	1	3				
Birth Defects				3		
Thyroid Gland Function	12	5	2			
Thyroid Disease		2				

Of the human studies, there was a wide variety of developmental neurotoxic endpoints, with the largest number being studies of IQ in children with 60 such studies.

F neurotoxicity

**Large number
of studies**

**NTP found many
more studies of F
neurotoxicity
compared to
what it has found
for other toxins
in its recent
reviews**

National Toxicology Program
U.S. Department of Health and Human Services

Systematic Review of Fluoride Exposure and
Neurodevelopmental and
Cognitive Health Effects

It is worth comparing this NTP review of fluoride neurotoxicity to NTP reviews of other toxic chemicals. The NTP's main purpose is to assess the toxicity of chemicals and they have issued several recent reports on other chemicals that concluded they were "presumed" hazards. But fluoride turns out to have many more studies than any of these other chemicals. The other chemicals shown are PFOA which is a perfluorinated chemical, BDE-47 is a brominated fire retardant, and "air pollution" which includes PM 2.5.

F neurotoxicity

Large number
of studies

20 of the
studies
were
considered
high quality
(low Risk of
Bias).

National Toxicology Program
U.S. Department of Health and Human Services

Systematic Review of Fluoride Exposure and
Neurodevelopmental and
Cognitive Health Effects

Figure_A3-01 Human Risk of Bias scores (neurobehavioral, lower RoB studies)
from HAWC's NTP project "Fluoride 2019"

10

The NTP carefully assessed every study and gave them scores for several domains. Of the 149 human studies, they determined that 20 were high quality, or in their terminology, at “low Risk of Bias”. When comparing this number of high quality human studies to the number available for other developmental neurotoxins, or for toxins of any type, this is a very large number. The EPA, for example, has determined that some chemicals are neurotoxins without a single high quality human study available.

The green in the graphic essentially means “good” and low Risk of Bias for that domain. Yellow and red indicate higher Risk of Bias. Of the 20 high quality studies, 18 were in children and all 18 found statistically significant adverse effects. This is the high level of consistency cited by the NTP in their conclusion of “presumed” neurotoxic in humans.

The graphic is from the NTP report but I have added the colored arrows that are **blue**, **purple**, and **black**. They indicate the exposure levels at which harm was found and are related to the exposure levels found in the USA, due largely to artificially fluoridated water. The **blue arrows** indicate studies that found adverse effects at 0.7 mg/L water fluoride concentrations or the equivalent in urine fluoride. 0.7 mg/L is currently the most common level of fluoridation in the USA. The NTP also considered that levels below 1.5 mg/L are relevant to exposures in the USA. I’ve marked those in **purple**. Half of the high quality studies found that exposures common in the USA were associated with harm, mostly lowered IQ.

F neurotoxicity Pre-conceptions

JAMA Pediatrics | Original Investigation
Association Between Maternal Fluoride Exposure
During Pregnancy and IQ Scores in Offspring in Canada

Frederick P. Rivara, MD, MPH, Robert Henning, PhD, David Hertz, PhD, D. Angeline-Bernier, MD, PhD,
Rachael Neufeld, MD, Harris Smith, PhD, Louis Morin, PhD, Christine Van Praag

JAMA Editor's Podcast excerpts, on Green 2019:

**Pre-conceptions that people who claimed that
fluoridation is harmful were “nuts”.**

Frederick P. Rivara, MD, MPH
Editor, *JAMA Networks Open*

Dimitri A. Christakis, MD, MPH
Editor, *JAMA Pediatrics*

11

I now want to discuss the reaction to the rapidly emerging evidence that fluoride is neurotoxic and can lower IQ of children. The single study which has received by far the most attention is the Green 2019 study published in *JAMA Pediatrics* in August 2019. You've probably heard about it and may have read it. I found the *JAMA* editors reactions to it to be very revealing of where most people, including health professionals, beliefs about fluoride have been ... and where they can move to when they have an open mind. I'm going to give excerpts from their Podcast discussion of the paper.

F neurotoxicity

Pre-conceptions

Dr Rivara- “The paper is about fluoride, and maternal fluoride exposure during pregnancy, and its effects upon IQ scores of children at ages 3 and 4, which in itself is like a shocking title, because I had never known that there was even any concern that maternal fluoride use might affect children’s IQ.”

Dr Christakis- “... the traditional teaching when I was going through residency in my early professional career was that fluoride was completely safe, all these people that are trying to take it out of the water are nuts, its the best thing that’s ever happened for children’s dental health, and we just need to push back and get it into every water system.”
“So when I first saw this title my initial inclination was **‘What the hell?’**”

12

Excerpts from their Podcast: audio clip A.

[Open "JAMAPed clip A" to play](#)

F neurotoxicity

“in Europe only 3% of municipal water supplies are fluoridated”

Editors surprised by just how much of the world does *NOT* fluoridate.

13

The editors were surprised at how many cities and countries do not fluoridate their water. In fact, the large majority of the world does not fluoridate.

F neurotoxicity

“in Europe only 3% of municipal water supplies are fluoridated”

Editors surprised by just how much of the world does *NOT* fluoridate.

Dr Rivara- “... this was from Canada and they picked some large cities in Canada; these were Montreal, Vancouver, Kingston, Toronto, Hamilton and Halifax; so I’m a little surprised that those places did not [all] have fluoridated water supplies.”

Dr Rivara- “And the other interesting thing that came out, like in the editorial and in this paper, was that in Europe only 3% of municipal water supplies are fluoridated.”

Dr Christakis- “Right, so again this was to me sort of eye-opening, that you know, I sort-of thought that ‘everyone did it’; certainly all developed countries, everyone that was at any level of sophistication was putting fluoride in the water.”

14

Excerpts from Podcast: audio clip B.

[Open "JAMAPed clip B" to play](#)

F neurotoxicity

A sizable effect “on par with lead”
“that’s a real concern”

Editors “really startled” at size of effect.

For an increase of 1 mg/L in maternal urine fluoride concentration, boys lost 5 IQ points.

The editors noted with concern that the loss of IQ from fluoridation is “on par with lead”. They also point out that even a small average drop of IQ of a few points, can produce a large increase in those on the lower tail of the distribution who need special education, and a halving of the number of gifted children on the high end distribution tail.

F neurotoxicity

**A sizable effect “on par with lead”
“that’s a real concern”**

Dr Rivara- “... a 1 mg/L increase in the maternal urinary fluoride concentration was associated with a 5 point lower score on the boys’ IQ.”

Dr Christakis- “Right. An effect size which is sizable, on a par with lead”

Dr Rivara- “Right, it is.”

Dr Rivara- “The effect size is really quite large, because when you think about it really in terms of not the individual child so much as the shift in the curve ... the shift in the curve, now, being shifted to the left, for boys, that’s a real concern”

Dr Rivara- “the results are really startling”

Dr Christakis- “... there have been other observational studies that have shown this, and there have been animal models as well, that have shown this idea that fluoride could be a neurotoxin; which again was totally news to me because I thought it was junk science, anyone would ever say such a thing.”

16

F neurotoxicity

Editor's advice: Pregnant mothers should avoid fluoridated water

The editors concluded with the advice that pregnant mothers should not drink fluoridated water.

F neurotoxicity

Editor's advice: Pregnant mothers should avoid fluoridated water

Dr Rivara- “So, if mothers now come into their doctor’s offices and ask the pediatrician what to do, what are you going to say?”

Dr Christakis- “I think I would advise them to drink bottled water, or filtered water, because its not a particularly odious thing to do, and potentially does reduce the risk.”

Dr Rivara- “Yea, you know the other thing is that some people may not be able to afford bottled water, it could be a financial burden to some low-income families, and we need to think about that as well.”

“Well, its going to get a lot of attention, and I’m very proud that you published it.” 18

F neurotoxicity

Individual Studies

19

I'm now going to briefly go over some of the most important individual studies. These will just be ones that the NTP rates high quality and low risk of bias.

F neurotoxicity

First studies from China

In the 1980s China started investigating F neurotoxicity because it had 100 million people living in endemic fluorosis areas due to natural F in groundwater.

No artificial fluoridation in China.

High Fluoride Pollution Sources in the People's Republic of China

20

Studies of fluoride's developmental neurotoxicity started in China in the 1980s. That's because large areas of China with a population of about 100 million used groundwater for drinking that had elevated fluoride levels. China and WHO consider water fluoride concentrations above 1.5 mg/L elevated. The map shows the large areas with elevated groundwater fluoride as light green. It shows other sources of fluoride exposure in other colors. Purple shaded areas are a special localized situation where people cook indoors using coal briquettes that are made from a mix of clay and coal. The clay is the source of the high indoor fluoride levels. Normal coal combustion, such as from power plants, is not a significant source of fluoride exposure. The large red "F" markers show the locations of neurotox studies, which are spread throughout China in many different populations. Almost all of the studies found reduced IQ in the children with higher fluoride exposure.

F neurotoxicity

Xiang 2003

High quality
study with
individual level
data; China.

Figure adapted
from Hirzy
2016 based on
data reported
in Xiang 2003.

F and IQ

21

The earliest studies in China were often of relatively unsophisticated design, but by about 2000, stronger study designs were being used. The Xiang 2003 study is the earliest study to be rated high quality in NTP's review. As shown in the graph, as the water fluoride increased, IQ steadily decreased. Loss of IQ is even apparent at concentrations below 1.5 mg/L.

F neurotoxicity

Xiang 2003

High quality study with individual level data; China.

F and % IQ below 80

Figure adapted from Hirzy 2016 based on data reported in Xiang 2003.

22

But Xiang 2003 also found an even more worrying effect by looking at the percentage of children with IQ below 80, as shown in this graph. At the lowest water fluoride level of about 0.8 mg/L, shown as group “A”, no children had IQ below 80. At the next higher level, group “B”, at about 1.5 mg/L, 10% of children had IQs below 80, and at the highest exposure level almost 40% of children had IQ below 80.

F neurotoxicity

Zhang 2015

High quality study; first
with gene-F interaction;
China.

**Found 5x greater
loss of IQ for those
with specific
genotype**

Genotype	N	IQ points lost per 1 mg/L urine F	p- value
combined	108	-2.42	0.030
val/val	28	-9.67	0.003

F and IQ
all genotypes combined

Figure based on Zhang 2015, Figure 1, with Benchmark
Dose analysis using PROAST method.

23

Of the 18 studies in children that NTP considers to be of high quality, I'm only going to discuss those that have some special feature. All 18 found statistically significant adverse effects. The Zhang 2015 study shown here was the first study to look at interactions between fluoride and genes. That is, it looked to see whether individuals with particular genetic variants were more susceptible to loss of IQ from fluoride than more common genetic variants. It found a 5-fold greater loss of IQ for a specific gene variant. The table on the lower left shows that for all children with all variants the loss of IQ was 2.42 points per 1 mg/L increase in urine fluoride, but for the val/val variant, the loss was 9.67 IQ points. About a quarter of the population had the val/val variant. The figure on the right shows how IQ drops in the susceptible group as urine fluoride increases. There is a substantial drop in IQ even at the lowest urine fluoride levels which are well below 1.5 mg/L.

F neurotoxicity

Valdez-Jimenez 2017

High quality study; first mother-offspring longitudinal cohort; Mexico.

F and IQ

Figure based on Valdez-Jimenez 2017, Table 4, with overlay of Till 2018 exposure levels in Canada.

24

This study is noteworthy because it is the first mother-offspring longitudinal cohort study. It measured fluoride in the mothers during pregnancy and then assessed the neurodevelopment of the infants. There was a steep drop in infant's neurodevelopment score, especially in the range of maternal urine fluoride below 1.5 mg/L. This study was in Mexico, but the exposure levels can be related to those in Canadian pregnant women or pregnant women in the USA, for that matter. The purple shading indicates urine fluoride levels found in a Canadian study. Much of the loss of IQ occurs within the shaded purple range.

F neurotoxicity

Bashash 2017

**High quality, mother-offspring
longitudinal cohort study;
Mexico City.**

**First NIH-funded study of
F developmental
neurotoxicity.**

**Found large, statistically
significant effects on IQ.**

**Average IQ losses of 4-6
points for each 1 mg/L
increase in mother's
urine F.**

F and IQ

Figure based on Bashash 2017, Figure 2.

25

This study, Bashash 2017, was the first funded by the US National Institutes of Health, or NIH, with a grants totaling about \$3 million. It is a very high quality study and found a large, statistically significant effect of fluoride on IQ. The average loss was 4 to 6 IQ points for each 1 mg/L increase in mother's urine fluoride. The graph shows the dose-response relationship found for children tested at age 4 years. It also shows in the blue bracketed region the range of fluoride levels expected in the USA and the resulting loss of IQ of 6 IQ points is shown in the red bracketed region.

To date, there have not been any published studies of maternal urine fluoride levels in the USA so the range shown here is based on studies in artificially fluoridated areas of Canada and New Zealand.

F neurotoxicity

Bashash 2017

Many potential confounders considered and/or adjusted for:

Child characteristics:

1. gestational age
2. weight at birth
3. sex
4. parity (being the first child)
5. age at outcome measurement

Maternal characteristics:

6. smoking history (ever smoked vs. nonsmoker)
7. marital status (married vs. others)
8. age at delivery
9. maternal IQ
10. education,
11. cohort (Cohort 3-Ca, Cohort 3-placebo and Cohort 2A)
12. HOME score (Home Observation for the Measurement of the Environment)
13. child's urine F at outcome assessment
14. SES (Socio-Economic Status)
15. maternal bone lead
16. maternal blood mercury
17. calcium supplement

Excluded from study if:

18. history of psychiatric disorders
19. high-risk pregnancies
20. gestational diabetes

or reported current use of:

21. daily alcohol
22. illegal drugs
23. continuous prescription drugs

or were diagnosed with:

24. preeclampsia
25. renal disease
26. circulatory diseases
27. hypertension
28. seizures during the index pregnancy

As just one indication of the high quality and rigor of the Bashash 2017 study, this is a listing of all the potential confounders that were considered and adjusted for if necessary.

Bashash 2017

**High quality, mother-offspring
longitudinal cohort study;
Mexico City.**

“Conclusion

In this study, higher levels of maternal urinary fluoride during pregnancy (a proxy for prenatal fluoride exposure) that are in the range of levels of exposure in other general population samples of pregnant women as well as nonpregnant adults were associated with lower scores on tests of cognitive function in the offspring at 4 and 6-12 y old.”

The study concluded: “higher levels of maternal urinary fluoride during pregnancy ... in the range of levels of exposure in other general populations ... were associated with lower scores on tests of cognitive function ... in offspring”. The phrase “in the range of levels of exposure in other general populations” is important, because it means this study in Mexico had fluoride exposures in the same range that women experience in the USA from artificially fluoridated drinking water. There is no artificial water fluoridation in Mexico, and instead salt is fluoridated, but the total intake of fluoride covers the same range as in the USA.

F neurotoxicity

Cui 2018

High quality study; with
gene-F interaction; China.

F and IQ

- Second study to ever look at gene-F interaction. Also found much greater susceptibility to IQ loss for those children with a gene variant:

10 IQ point loss for 1 mg/L increase in urine F.

- 4x greater loss than for all children combined.

- 14% of children had susceptible TT gene variant.

Figure based on
Cui 2018, Table
1 and Table 4.

28

This study, Cui 2018, is noteworthy because it is the second to examine gene-fluoride interactions. Just as the first such study by Zhang 2015, it found a much greater loss of IQ in those children with a particular gene variant, although in this study they looked at a different gene. For the genetically susceptible children, this study found a 10 IQ point loss for each 1 mg/L increase in urine fluoride. This was a 4-fold greater loss than in all children combined. 14% of the children had this susceptible gene variant. The graph shows that this large loss of IQ was found even below 1.5 mg/L urine fluoride.

F neurotoxicity

Green 2019

High quality, mother-offspring longitudinal cohort study; Canada.

- Second NIH-funded study of F developmental neurotoxicity.
- Found large, statistically significant effects on IQ.
- Average IQ loss of 4.5 points in boys for each 1 mg/L increase in mother's urine.
- Average IQ loss of 3.7 points for each 1 mg/day increase in mother's F ingestion.

JAMA Pediatrics | Original Investigation
Association Between Maternal Fluoride Exposure During Pregnancy and IQ Scores in Offspring in Canada
Hodgeshaw JA, Brown L, et al. *JAMA Pediatrics*. 2019;173(12):e190000. doi:10.1093/pediatrics/kiz123

F and IQ

29

The Green 2019 paper is the highly cited study in *JAMA Pediatrics*, which the editors commented about in their Podcast that I gave excerpts from earlier. This study was also NIH funded, and is important not just because of its very high quality, but because it was done in Canada. Canada is about as similar to the USA in socioeconomic and fluoride exposure conditions as anywhere. Fluoride exposure in both countries comes mainly from artificial water fluoridation, with the average level in Canada being about 0.6 mg/L and in the USA, somewhat higher, at 0.7 mg/L. Although no study of fluoride and IQ has yet been done in the USA, this study in Canada can be considered very applicable to the USA.

It found large statistically significant effects on IQ. For boys, the average IQ loss was 4.5 points for each 1 mg/L increase in mother's urine. The study also estimated total daily fluoride intake in the mothers and found an average 3.7 IQ points loss for both boys and girls for each 1 mg/day increase in mother's fluoride ingestion.

Defenders of water fluoridation have tried to criticize this Green 2019 study. I won't get into a detailed discussion of this, other than to point out that the authors themselves have rebutted virtually all the criticisms in a letter published in *JAMA Pediatrics* in December 2019. If you are interested in the discussions about the validity and relevance of the Green 2019 study that response letter is a good place to start.

F neurotoxicity

Malin 2019

1st study of F and sleep patterns; adolescents in USA.

- **Altered sleep patterns in adolescents** linked to levels of fluoride in the drinking water in the USA.
- Study used nationally representative NHANES data collected by CDC.
- Animal studies suggest F may impair melatonin production in pineal gland.

30

The NTP review of fluoride neurotoxicity studies only included studies published up until August 2019. There have been 3 more high quality studies published in just the last 6 months, and they both reinforce and extend the evidence compiled in the NTP review. This study, Malin 2019, was the first to ever examine sleep patterns in relationship to fluoride exposure. Furthermore, it used data from the USA in the nationally representative sample of the NHANES survey conducted by the CDC. It found altered sleep patterns in adolescents with higher drinking water fluoride levels. Altered sleep patterns can be considered a neurologic effect. Animal studies suggest fluoride may impair melatonin production in the pineal gland, so that might be the mechanism for altering sleep patterns.

F neurotoxicity

Till 2020

High quality, mother-offspring
longitudinal cohort study;
F in infant formula;
Canada.

Dramatic lowering of IQ

NEW STUDY:
FLUORIDATION LOWERS IQ OF FORMULA-FED BABIES

FLUORIDE & IQ
NEW STUDY
PUBLISHED 2019

Fluoride exposure from infant formula and child IQ in a Canadian birth cohort
Shannon Bell¹, Rasha Ghossein², David Ploner³, Richard Huxley⁴, E. Angelika Martinez-Mill⁵,
Mandy Brown⁶, Linda Fawcett⁷, Phyllis Ayoub⁸, Gina Muckle⁹, Bruce Langlois¹⁰

NIH
National Institutes of Health
Department of Health and Human Services

31

This is the most recently published study, and in my opinion, is the most concerning study yet. It was done in the same Canadian cohort as the Green 2019 paper in *JAMA Pediatrics*. But, instead of estimating prenatal exposure to fluoride it measured exposure to the infants between birth and age 6 months, with comes largely through infant formula when it is made up with fluoridated water.

F neurotoxicity

Till 2020

High quality, mother-offspring
longitudinal cohort study;
F in infant formula;
Canada.

*Children who were formula-fed and lived in
fluoridated areas as babies have dramatically
lower IQ compared to those who lived in non-
fluoridated areas.*

The composite image includes a photograph of a baby's face and a bottle of formula. Overlaid on the image is a circular stamp with the text 'FLUORIDE & IQ' at the top, 'NEW STUDY' in the center, and 'PUBLISHED 2019' at the bottom. To the right, a snippet of a news article is visible, with the title 'Fluoride exposure from infant formula and child IQ in a Canadian birth cohort' and a list of authors including Christine Tuff, Rasha Ghara, David Fraser, Richard Harrison, E. Angelika Martinez-Mor, Maiky Rivera, Linda Fawcett, Phyllis Ayres, Gina Muckle, and Bruce Langlois. The NIH logo is also present in the bottom right corner.

32

The study found that children who were formula-fed and lived in fluoridated areas as babies have dramatically lower IQ compared to those who lived in non-fluoridated areas.

F neurotoxicity

Till 2020

High quality, mother-offspring
longitudinal cohort study;
F in infant formula;
Canada.

F and IQ

Very large loss of IQ with increasing tap
water F for *formula-fed infants*:

-9 IQ points (Full Scale IQ) for each 1 mg/L increase in
tap water F.

based on Till 2020, Table 2

33

Children given formula as infants **lost 9 IQ points** for each 1 mg/L increase in tap water fluoride. For the so-called Performance Scale IQ score, also known as “non-verbal IQ score”, **the children lost 19 points** for each 1 mg/L increase in tap water fluoride. These are dramatic and very concerning reductions in IQ that are even larger than the losses from prenatal exposure.

Two possible factors may explain this greater loss from infant period exposure than from prenatal. First: Brain development is actually more rapid during early infancy than prenatally, so may be more sensitive to disruption by neurotoxic agents. Second: Infant exposures to fluoride are much simpler and are less subject to random error than are maternal urine fluoride measurements. Maternal urine fluoride can vary by whether the mother ingested any fluoride in the hour or so before the urine sample was taken. Random error in estimating the prenatal exposures can lead to what is called “bias toward the null” which is an underestimate of the true effect. Therefore, the studies of prenatal fluoride exposure may be underestimating the size of the effect. In contrast, this study of fluoride from infant formula is not underestimating the effect, so this larger effect may be closer to the true effect.

F neurotoxicity

Till 2020

High quality, mother-offspring
longitudinal cohort study;
F in infant formula;
Canada.

**Recommendation: no fluoridated
water for infants**

**NEW STUDY:
FLUORIDATION LOWERS IQ OF FORMULA-FED BABIES**

“After adjusting for fetal exposure, we found that fluoride exposure during infancy predicts diminished non-verbal intelligence in children. In the absence of any [dental] benefit from fluoride consumption in the first six months, it is prudent to limit fluoride exposure by using non-fluoridated water or water with lower fluoride content as a formula diluent.”

The authors conclude that for infants: **“in the absence of any [dental] benefit from fluoride consumption in the first six months, it is prudent to limit fluoride exposure by using non-fluoridated water”** to make formula.

F neurotoxicity

Fluoride and ADHD

Three studies of Fluoride and ADHD

35

While most studies of fluoride neurotoxicity have looked at IQ loss, there have also been several that have looked at the association with ADHD, or Attention Deficit Hyperactivity Disorder. I'll discuss three such studies.

F neurotoxicity

Malin 2015

F and ADHD

Exposure to fluoridated water and attention deficit hyperactivity disorder prevalence among children and adolescents in the United States: an ecological association

1st study of F and ADHD; ecological; USA.

Dramatic rise in ADHD prevalence as percent of state fluoridated increased.

About 50% higher ADHD rate in states with most fluoridation compared to those with least.

36

The first study to ever look at fluoride and ADHD was by Malin in 2015. It found a dramatic increase of ADHD prevalence with increasing percent of state-level fluoridation. States with high proportions of their population fluoridated had significantly higher rates of ADHD than states with less fluoridation. The effect is large, with the most fluoridated states having about 50% higher rates of ADHD than the least fluoridated states.

The study also looked at secular trends in ADHD rates by comparing surveys conducted in three different years: 2003, 2007, and 2011. In the graph, the red is the earliest survey in 2003, the light blue is the middle survey in 2007, and the most recent survey in 2011 is shown in dark blue. ADHD diagnoses have been increasing over time, and the association between fluoridation and ADHD has continued and even grown between 2003 and 2011.

F neurotoxicity

Bashash 2018

**1st high quality
study of F and
ADHD; Mexico.**

**Statistically
significant increase in
ADHD Total Score
(inattentive and
hyperactive-impulsive
behaviors combined)
with higher maternal
urine F.**

F and ADHD

37

The next study of fluoride and ADHD was the first using a high quality longitudinal mother-child cohort design. It found a statistically significant increase in child ADHD score with increasing prenatal exposure, as estimated by the maternal urine fluoride level.

F neurotoxicity

Riddell 2019

High quality study of F
and ADHD; Canada.

F and ADHD

Found almost **300% higher risk of ADHD** for those living in fluoridated areas in national sample of Canadian children.

Found **600% higher risk of ADHD** for every 1 mg/L increase in tap water F.

“In conclusion, we found that higher tap water fluoride levels and fluoridation of municipal water supplies were associated with a higher risk of an ADHD diagnosis as well as increased symptoms of hyperactivity and inattention, especially among adolescents.”

38

The latest fluoride ADHD study was published just a few months ago, and found a dramatically higher risk of ADHD in children living in fluoridated areas of Canada compared to those living in unfluoridated areas. The risk of having a diagnosis of ADHD was **300% higher** in fluoridated areas. The study used a sample of children from throughout Canada from the CHMS survey or Canadian Health Measures Survey. This survey is conducted by Health Canada and is similar to the NHANES survey in the USA.

The increased risk of ADHD, when stated in terms of a 1 mg/L increase in the tap water fluoride concentration, was **600% higher**.

An implication of these findings is that the majority of ADHD cases may be attributable to water fluoridation.

The Scientific Evidence for Fluoride's Developmental Neurotoxicity . . .

is Overwhelming

39

Summarizing the overall body of evidence, with particular focus on the strong studies discussed here, the scientific evidence for Fluoride's developmental neurotoxicity ...

is Overwhelming.

F neurotoxicity

Should we care?

What are the implications of a few IQ points lost per person?

Should we care?

40

But what are the implications of a few IQ points lost per person, on average? Should we care?

F neurotoxicity

Population-wide IQ loss

Estimate of total IQ points lost in the USA due to fluoridated water

Using similar methods as Bellinger 2012 used for other risk factors.
 Assume steady-state conditions of exposure.

Loss of IQ for infants fed formula made up with fluoridated tap water:

8.8 IQ points loss per 1.0 mg/L increase in tap water F (Till 2020)

0.46 mg/L difference in water F between fluoridated and non-fluoridated areas (Till 2020)

$8.8 \times 0.46 = 4.1$ IQ point average loss in fluoridated areas

50% of infants formula-fed in first 6 months (Till 2020)

70% of USA has fluoridated tap water

$50\% \times 70\% = 35\%$ formula-fed and have fluoridated water

3.8 million children born in USA each year

3.8 million children $\times$ 35% who are formula-fed and have fluoridated tap water $\times$ 4.1 IQ points loss =

**5.4 million IQ points lost per year in the USA
 due to water fluoridation**

As the *JAMA Pediatrics* editors noted in their Podcast, even a small shift downward in the distribution of IQ scores can represent a large population-wide loss of IQ. In order to compare the total harm to the population of the USA from fluoridation to that from other causes of IQ loss, we have calculated the total IQ points lost per year. Since infant formula made with fluoridated water appears to represent the greatest effect on IQ, we used the results from the Till 2020 study in Canada to estimate the total number of IQ points lost in the USA, assuming the same dose-response and infant feeding practices as in Canada but accounting for the much larger population of the USA with fluoridated water. We estimated that 5.4 million IQ points are lost per year. It is likely that a certain fraction of the population who are genetically more susceptible will bear the majority of the burden, although considering the large magnitude of the effect found in the Till 2020 study amongst all children, it is plausible that even those who are genetically less susceptible will suffer loss of IQ.

F neurotoxicity Comparison

*Water fluoridation
causes greater loss of IQ
in the USA than any
other risk factor*

All risk factors except fluoride based on Bellinger 2012, Table 2.

42

A loss of 5.4 million IQ points per year can be put into context by comparing it to the estimated losses from a variety of other risk factors, including the best known developmental neurotoxic chemicals lead, mercury, and organophosphate pesticides. Bellinger 2012 estimated the total USA-wide IQ loss for 16 other well-established risk factors and I have graphed them here. My estimate shows that fluoridated water is responsible for a greater total IQ points loss than any of the other risk factors, including lead, organophosphate pesticides, and preterm birth.

F neurotoxicity

Population-wide
economic cost

\$\$\$ cost of
Fluoridation?

Estimate of total dollar cost due to IQ loss from fluoridated water and
subsequent lower lifetime incomes, in the USA.

43

It may seem crass, but there are standard methods for estimating the total economic cost to society from IQ loss. The main economic harm arises from the reduced lifetime earnings which have been found associated with lowered IQ.

F neurotoxicity

Population-wide economic cost

\$\$\$ cost of Fluoridation?

**Estimate of total dollar cost due to population-wide IQ loss from
fluoridated water and subsequent lower lifetime incomes, in the USA.**

\$20,000	lifetime earnings lost per 1 IQ point reduction per person
79 years	average life expectancy
\$254	earnings lost per year per person per 1 IQ point reduction
327 million	population of USA
50%	percent of infants who drink formula
70%	percent living in fluoridated area as infants
35%	percent of persons who had formula and lived in fluoridated areas as infants
114 million	number of persons in USA who had formula and lived in fluoridated areas as infants
-4.1	average IQ point loss for formula-fed infants in fluoridated areas compared to non-fluoridated
-\$117 billion	annual earnings loss for USA (assuming steady state exposure and costs)

Over \$100 billion per year in USA

44

We have calculated the annual dollar cost of water fluoridation, from earnings lost due to lower IQ. We have used standard methods of health economists that have been applied to other developmental neurotoxins, like mercury. It is worth noting that the US EPA considers that a population-wide average loss of just 1 IQ point is an adverse effect to be avoided.

A standard estimate for lifetime earnings lost per person for a 1 IQ point lowering is about \$20,000. When applied to the population of the USA who are formula-fed as infants and live in fluoridated areas, it works out to a cost of over \$100 billion a year. This assumes steady-state exposure and costs. This is a huge economic cost.

F neurotoxicity

Should we care?

• **4.5 million IQ points lost per year; more than any other risk factor.** Fluoridation is causing more economic harm due to lowered intelligence and achievement than any other IQ risk factor, including lead, mercury, and preterm birth.

• **\$100 billion per year; much more harm than good.** Water fluoridation is causing much more economic harm from IQ loss than any dental benefit it might provide.

• **Easier to solve than any other environmental problem.** Water fluoridation can be stopped immediately at virtually no cost. No other environmental harm is so easily solved.

Pregnant mothers and children should be protected from the risks posed by fluoride.

45

So, should we care about the scientific evidence showing water fluoridation lowers IQ by a few points? **Absolutely!** Fluoridation is doing much more economic harm than good.

- The dollar cost of IQ loss far exceeds any dental benefit water fluoridation may provide. Furthermore, there is no dental benefit from fluoride prenatally and in infancy. It is well established that the dominant dental benefit of fluoride comes from topical contact on the teeth and not from swallowing the fluoride.
- Fluoride may be causing more neurocognitive harm than any other risk factor, including lead, mercury, and preterm birth.
- The environmental health harm from fluoridation is easier to solve than any other environmental problem. Simply stop adding fluoridation chemicals to public drinking water. I'm not aware of any other environmental harm that is so easily and inexpensively solved.
- **Pregnant mothers and children should be protected from the risks posed by fluoride.**

F neurotoxicity

Should we care?

So ... Should we care?

I'd be happy to answer any questions about the science and individual studies.

Hello Mark,

Thanks for the phone call today. I look forward to Monday's Protection and Policy meeting! I am copying the other board members and clerk so they have these important documents.

Below are the highlighted studies from the ELEMENT and MIREC projects which were studying toxins in our environment. They just happened to study fluoride as part of the broad range of toxins.

I highlighted the contact for Bruce, one of the world's leading researchers on toxins in the environment and their effects on children's health. Please reach out to him. I met him at UW Madison a few years ago.

The bottom line is that fluoride is harmful to the developing fetus and during the first 6 months of life. During both time periods, fluoride is completely unnecessary and should be avoided. Adding fluoride to public water is an unreasonable risk during the most critical time period of development. Exposure during this time increases learning disabilities and ADHD. Green Bay children and the public school system do not need the burden of increased learning disabilities. Learning disabilities can lead to behavioural issues, crimes, and substance abuse.

In July 2020 The Journal of Pediatrics published, Translating Best Evidence into Best Care, stating, "...since the beneficial effects of fluoride predominantly occur at the tooth surface after teeth have erupted, whereas fluoride is not essential for growth and development, a cautious step could be avoidance of fluoridated products and water by women during pregnancy and by infants during the first 6 months of life." [https://www.jpeds.com/article/S0022-3476\(20\)30467-4/fulltext#secsectitle0045](https://www.jpeds.com/article/S0022-3476(20)30467-4/fulltext#secsectitle0045)

Maternal and fetal exposures to fluoride during mid-gestation among pregnant women in northern California <https://ehjournal.biomedcentral.com/articles/10.1186/s12940-020-00581-2?eType=EmailBlastContent&eId=5e4bf31d-32d9-49e1-a78a-8fc83cf8cab7>

If you have questions on the issue of fluoride chemicals added to the public drinking water supply please reach out to:

Dr. Bruce Landphear a researcher from BC Children's Hospital and Professor at Simon Fraser University
1 778 782-8650
blanphear@sfu.ca
<https://www.sfu.ca/fhs/about/people/profiles/bruce-landphear.html>

Dr. Phillip Grandjean from Harvard T.H. Chan School of Public Health pgrand@hsph.harvard.edu
<https://www.hsph.harvard.edu/philippe-grandjean/>

Dr. Bruce Landphear a researcher from BC Children's Hospital and Professor at Simon Fraser University, "Our study of prenatal fluoride and IQ in the MIREC cohort (Green 2019) further enhances the quality of data related to the neurotoxicity of fluoride. As with the ELEMENT cohort, we employed a prospective cohort design, had extensive control for potential confounders, and had multiple measures of fluoride exposure during pregnancy, including three types of urinary fluoride measurements for each trimester of pregnancy. The maternal urinary fluoride levels in the MIREC cohort were significantly associated with lower intellectual abilities in 3-4-year-old children. These associations remain large and significant when controlling for relevant covariates. Converging results from the MIREC and ELEMENT cohorts indicate that exposure to "optimal" levels of fluoride during fetal development is associated with diminished intelligence in childhood. In the MIREC cohort, exposure to fluoridated water in infancy, particularly among formula-fed infants, was also associated with diminished intelligence (Till 2020). This association remains significant after controlling for fetal fluoride exposure and other relevant covariates, suggesting that susceptibility to fluoride's adverse neurological effects may extend into infancy."

Dr. Grandjean from Harvard T.H. Chan School of Public Health, "The weight of epidemiological evidence leaves no reasonable doubt that developmental neurotoxicity is a serious human health risk associated with elevated fluoride exposure, including those occurring at the levels added to drinking water in fluoridated areas. The IQ losses associated with community water fluoridation are substantial and of significant public health concern."

Dr. Hu, "The ELEMENT prospective cohort studies of fluoride's neurodevelopmental effects are methodologically rigorous studies that provide scientifically reliable and robust results. The results of the ELEMENT prospective cohort studies are consistent with and support the conclusion that fluoride is a developmental neurotoxicant at levels of exposure seen in the general population in water-fluoridated communities."

I am attaching the closing arguments from our trial. A powerpoint of the studies we used in our suit. Also, some of the declarations from leading experts in child development and environmental chemical exposures.

Thanks,
Brenda Staudenmaier

MINUTES
PROTECTION & WELFARE COMMITTEE
Monday, January 30, 2017
City Hall, Room 207
5:00 p.m.

MEMBERS PRESENT: Chairperson Ald. Scannell, Vice Chairperson Ald. Dorff,
Ald. Galvin, Ald. Zima

MEMBERS EXCUSED: None

MEMBERS ABSENT: None

OTHERS PRESENT: Asst. City Atty Joe Faulds, Captain John Laux; Chief of Staff
Celestine Jeffreys; General Manager Nancy Quirk of Green Bay
Water Utility, Water Quality Manager Russ Hardwick, Ald. David
Nennig and other interested parties

1. Roll Call. Ald. Scannell, Ald. Dorff and Ald. Galvin were present. Ald. Zima arrived later.

The meeting was called to order by Chairman Scannell at 5 p.m.

2. Approval of the Agenda.

Motion made by Ald. Scannell to take agenda item #11 before item #10 on the agenda.

Motion to approve the amended agenda made by Ald. Dorff; seconded by Ald. Galvin. Motion carried.

3. Approval of the minutes from the January 9, 2017 meeting.

Motion to approve the minutes made by Ald. Dorff; seconded by Ald. Galvin.

Motion carried.

4. Consideration with possible action a request by Green Bay Sportservice, Inc. to amend their "Class B" Combination License at 1265 Lombardi Ave. to include the Johnsonville Tailgate Village with attached deck.

The Law and Police departments had no objections.

Motion by Ald. Dorff; seconded by Ald. Galvin to approve a request by Green Bay Sportservice, Inc. to amend their "Class B" Combination License at 1265 Lombardi Ave. to include the Johnsonville Tailgate Village with attached deck.
Motion carried.

5. Consideration with possible action on an application for a “Class A” Cider License by Kwik Trip, Inc. at 515 W. Walnut St. (currently has beer license).

The Law Department had no objections.

Approved by Ald. Dorff; seconded by Ald. Galvin to approve a “Class A” Cider License by Kwik Trip, Inc. at 515 W. Walnut St. (Currently has beer license approved).

6. Consideration with possible action on an application for an available “Class B” Combination License by Copper State Brewery, LLC at 313 Dousman St. The Law and Police departments had no objections.

Ald. Scannell mentioned the outdoor beer garden would be fenced in with shrubbery.

Motion by Ald. Galvin; seconded by Ald. Dorff to approve an application for an available “Class B” Combination License by Copper State Brewery, LLC at 313 Dousman St.

7. Consideration with possible action on an application for a “Class B” Combination License by Timothy J. Rueckl at 704 Bellevue St. (Currently Greger’s Bad Habit Saloon).

Cpt. Laux mentioned there were some reservations. Cpt. Laux said the license stipulations were agreed to minus one item, which states: “The Licensee or any employee of a license establishment is prohibited from being under the influence of an intoxicant, or a controlled substance or an combination of an intoxicant and a controlled substance, while performing services or job duties on the licensed premises.” During the meeting with the Police Department, Mr. Rueckl made mention he would like to be able to enjoy a beverage with a patron. He assured the Police Department he was not planning on being intoxicated. Cpt. Florence approved the business plan, however, wanted the Council to be aware this item was not signed off on.

Ald. Galvin asked if this item on the license stipulation could be reworded.

Cpt. Laux said the license stipulation is a bit outdated and plans to work with the Law Department to reword this portion.

The Law Department had no objections to approve the application.

Motion by Ald. Dorff; seconded by Ald. Galvin to approve an application for a “Class B” Combination License by Timothy J. Rueckl at 704 Bellevue St. (Currently Greger’s Bad Habit Saloon).

Ald. Zima arrived to the meeting.

8. Consideration with possible action on an application for a "Class B" Combination License by Chanmina, LLC at 1423-1425 S. Broadway Ave. (Currently the Last Drop).

The Police and Law departments had no objections.

Motion by Ald. Zima; seconded by Ald. Dorff to approve an application for a "Class B" Combination License by Chanmina, LLC at 1423-1425 S. Broadway Ave. (Currently the Last Drop).

9. Consideration with possible action on an appeal by Amber Piette to the denial of her Operator License application.

The Law and Police departments recommended denial based on her record.

Motion made by Ald. Dorff; seconded by Ald. Scannell to open the floor. Motion carried.

Amber Piette - 1504 Plymouth Ln
Piette handed character witness letters to the committee.

Ald. Dorff asked what treatment programs Piette has went through and how it has changed her.

Piette said went through AODA class and assessment. She is clean. She has two small children, two jobs and works hard. She was 17 years old when she received her felony.

Piette wants to obtain the license to work at Lambeau Field and Tundra Lodge. Ald. Zima asked how long she has lived in Green Bay.

She moved to Green Bay eight months ago. She previously lived in Shawano County. She moved closer for her position at Lambeau Field, which she has worked at for 2 years.

Ald. Zima asked Piette to obtain a letter from their employer stating they are aware of her past and would like Piette to have a license. Piette said she would ask.

Motion made by Ald. Dorff; seconded by Ald. Galvin to close the floor. Motion carried.

Ald. Zima agrees that Piette has shown a change in her life. She has children and now leads a more responsible lifestyle.

Motion by Ald. Zima; seconded by Ald. Dorff to approve an appeal by Amber Piette to the denial of her Operation License application, contingent upon receipt of a letter of recommendation from her employer.

11. Consideration with possible action on the amendment to GBMC § 6.215 relating to Commercial Quadricycles.

The ordinance was approved in 2016 and is in regards to Quadricycles, also known as pedal pubs.

Asst Cty Atty Faulds discussed the changes.

One change made was the date an operator's license would expire. It was changed to Dec. 31 instead of May 31 as pedal pubs are a seasonal operation. Another change was in Section 3B regarding route approval. The permanent routes are to be approved/denied/amended through the Protection & Welfare Committee.

Ald. Zima suggested a member from the traffic department review permanent routes as well. Asst Cty Atty Faulds said this could happen internally. Changes were made in section 5 about temporary routes. These will now go through the police department to have a faster turnaround time. Temporary routes could be submitted up to three days before the event.

Ald. Zima asked why temporary routes would need such a short turnaround time. Ald. Scannell said special events could be a private event, such as weddings, birthdays and graduations. These might have not been planned as far in advance.

Ald. Galvin mentioned street closures. Also, the committee only meets once a month in the summer. This allows an avenue for operator's to prevent problems.

Ald. Dorff moved to approve, with a replacement of a sentence in section 5. She wanted it to read: "No licensee shall operate a Commercial Quadricycle on a street closed off to public traffic, regardless of whether the street is included an approved route."

Motion by Ald. Dorff; seconded by Ald. Zima to approve the amendment to GBMC § 6.215 relating to Commercial Quadricycles with revisions. Motion carried.

10. A request by Brenda Staudenmaier to rescind the resolution authorizing fluoride chemicals in public drinking water.

The police department had no position on the topic. Cpt. Laux was excused for the remainder of the meeting.

Motion made by Ald. Galvin, seconded by Ald. Dorff to open the floor. Motion carried.

Ald. Scannell mentioned this is a heated topic and asked everyone to remain civil and focus on the ideas and science.

Brenda Staudenmaier-423 S. Van Buren St.

Staudenmaier is a resident of Green Bay. She is also a certified WI Dept. of Natural Resources Drinking Water Operator and Waste Water Operator. She is a Certified Hazard Walker through OSHA. Her continued education is in Environmental Engineer Water technology with a focus on human health and water solutions. She was recognized in 2016 by the White House for her work.

Staudenmaier said fluoride was introduced to Green Bay's water system in 1957. She said it is a chemical that does not occur naturally. It has been sold as something that is good for our teeth, but it is a contaminate that can promote disease.

She submitted 196 studies with a petition to the EPA showing fluoride is a developmental neuro-toxin that can cause learning disabilities.

Staudenmaier noted a city in Maine recently removed fluoride in their water. Their reasoning was that 40 percent of American adolescents are exhibiting some degree of dental fluoresce. Too many people are getting too much fluoride.

Staudenmaier recognized this is a controversial topic and people lean towards the side of caution. The science being used to defend the claims are outdated and biased.

She further presented arguments regarding removing fluoride in Green Bay's Water System.

Lacey Kuehl at 1002 Estes Dr. in De Pere spoke against fluoride in the water. She grew up in Green Bay on Crooks St.

Ald. Zima asked Staudenmaier if water filters take fluoride out of water. Staudenmaier said there are expensive ones that do, but water filters like Brita do not.

Nancy Miller, a Dental Hygienist, spoke in favor of fluoride in the water. Mat Cresipin, Associate Director at Childrens Health Alliance of WI, spoke in favor of fluoride in the water. He had a PowerPoint presentation.

Martin Zahariev, a Green Bay resident at 560 Fair Winds Ln., spoke against fluoride in the water.

Dr. Paula Krum a Periodontist and an Ashwaubenon resident at 2456 Ingold Ct., spoke in favor of fluoride in the water.

Andrew, a Certified Water Operator from Marinette, spoke against fluoride in the water.

Keith Decker, a Green Bay resident at 2821 Bristol Mountain Trl., spoke against fluoride in the water.

Nhia Yang, a Green Bay resident at 1022 Pine St., spoke against fluoride in the water.

Jenna Linden, 9 Cherry Ct. Appleton, WI, spoke in favor of fluoride in Green Bay. She is a Dental Hygienist in Green Bay and currently a Clinical Director at the Brown County Oral Health Partnership.

Lisa Hanson, a Green Bay resident at 708 Kellogg St., spoke against fluoride in the water.

Michael Schwartz-Oscar, a Green Bay resident at 322 S. Van Buren St. and Executive Director of Oral Health Partnership, spoke in favor of fluoride in the water.

Nancy Quirk, General Manager of Green Bay Water Utility, spoke in favor of fluoride in the water. She is an engineer and has been in the drinking water industry for 30 years. She said state Water Utilities follow the DNR codes and are regulated by EPA and the Public Service Commission. Green Bay's Water Utility follows the Safe Drinking Water Act recommendations. Green Bay's Water Utility adds fluoride based on section NR809.74 as regulated by state statutes.

The standard for buying our fluoride is the AWWA standard B703. This on file and information is available to view at the Green Bay Water Utility.

The amount of fluoride found naturally in the water is .1 to .2 mg per liter. Green Bay does add fluoride to a level of .7 mg per liter. Quirk said this is the lowest level the CDC recommends a city can go to ensure that we are protecting our teeth. Fluoresce can occur if more than 2 mg per liter is added to the water.

Quirk stated the pumps are set to eject .7 ppm. If the pumps release too much fluoride, it shuts off. The fluoride content is monitored 24 hours a day.

Fluoride in water is recommended by public health, medical and dental organizations. The US Surgeon General said water fluoridation was the best thing that has happened in the country.

Quirk serves on the National Committee for the Water Utility Council of American Water Works, which stays closely in touch with science and perform studies to regulate the standards.

Ald. Scannell asked if the amount of water you drink can have an effect.

Quirk said the amount was based on normal drinking habits. Some do drink more and some less. This is why the amount added into the water system was lowered due to exposure people have to other fluoride.

Ald. Scannell asked how a fluoride spill would be handled.

Water Quality Manager Hardwick said a spill would be contained in the dosage room and the local fire department would be contacted for proper disposal.

Chuck Decker responded stating he has seen a spill and it had to be addressed with hazmat suits and gas masks.

Quirk said the amount of fluoride is a meniscal amount, amounting to 42 seconds over the course of two years. Quirk said her decision is based on the best health advice available. However, if the Common Council makes a decision to take it out she will follow.

Ald. Galvin asked if the Water Utility monitors for lead and arsenic. Quirk said it is monitored.

Ald. Zima asked if she has looked into the communities that have removed fluoride in the water.

Quirk has not been in contact with them, but will research.

Chuck Decker, a Green Bay resident at 2821 Bristol Mountain Trl., spoke against fluoride in the water.

Keyundray Schultz, a Green Bay resident at 3647 Glenhaven Ln, spoke against fluoride in the water.

Dawn Craft, a Green Bay resident at 2040 Farlin Ave. and a WPS Service Analysis, spoke against fluoride in the water.

Carrie Stempski at 2829 E. Pennwood Cir., a hygienist who is now in management, spoke in favor of fluoride in the water.

Dean Pigeon, a Green Bay resident at 428 Menlo Park Rd, spoke against fluoride in the water.

Anna Destree at 3616 Stanford Dr. New Franken, Interim Health Officer of the Brown County Health Department, spoke in favor of fluoride in the water.

Miriam Owen, a Green Bay resident at 1320 E. Walnut St., spoke against of fluoride in the water.

Staudenmaier, who brought this forward to the committee, reiterated fluoride is a pesticide and an enzyme inhibitor. Staudenmaier asked on behalf of the citizens of Green Bay to have it removed from our water.

Motion made by Ald. Dorff; seconded by Ald. Galvin to close the floor. Motion carried.

Motion by Ald. Scannell; seconded by Ald. Dorff to take a ten minute recess. Motion carried.

Meeting resumed 10 minutes later.

Ald. Zima said those who spoke were speaking from the heart and with intelligence. Ald. Zima wants to respect individuals rights, however, cannot think of a way to offer both choices to citizens. He would not be able to make a decision at this time. In his personal experience, he has not been hurt by fluoride. He was taught to brush and take care of his teeth and not sure if the fluoride helped or not. He was open-minded and wanted more time to review the information.

Ald. Dorff had great respect for those who spoke tonight. She wished one person could come up to the podium and said well there is this, but also this. There were both sides of the spectrum. She would now have to look and decide for herself and be responsible and make a good decision for the community. She was not ready to make the decision that night. She has been a child advocate for the last 38 years and helped bring oral health into the Green Bay Public Schools. In a perfect world, it would be ideal to allow a choice of fluoridated and non-fluoridated taps, however, it would not be feasible. She sees both sides of the debate and would look further into the information to make an informed decision.

Ald. Galvin appreciated the passion of those who spoke and self-educated themselves on the subject. If it was just about tooth decay, it would be an easy answer. However, there are other factors to take into consideration. Ald. Galvin would like more time to review the studies further.

Ald. Scannell said he was leaning a particular way. As an alderman, Ald. Scannell relies on the staff to make an informed decision. He felt the expertise in this case is the established community. However, he will study the information left a door open to change his mind.

Motion made by Ald. Dorff; seconded by Ald. Galvin to hold until the Feb. 27 Protection & Welfare Meeting a request by Brenda Staudenmaier to rescind the resolution authorizing fluoride chemicals in public drink water. Motion carried.

Motion made by Ald. Galvin; seconded by Ald. Dorff to adjourn meeting. Motion carried.

Meeting adjourned at 8:15 p.m.

MINUTES
PROTECTION & WELFARE COMMITTEE
Monday, February 27, 2017
City Hall, Room 207
5:00 p.m.

MEMBERS PRESENT: Chairperson Ald. Scannell, Vice Chairperson Ald. Dorff, Ald. Galvin, Ald. Zima

MEMBERS EXCUSED: None

MEMBERS ABSENT: None

OTHERS PRESENT: Asst. City Atty Joe Faulds, Captain Todd LePine, Ald. Christopher Wery; General Manager Nancy Quirk of Green Bay Water Utility, Water Quality Manager Russ Hardwick of Green Bay Water Utility, Animal Control Officer Mallory Meves, and others

1. Roll Call. All present.
The meeting was called to order by Chairman Scannell at 5 p.m.
2. Approval of the Agenda.
A motion was made by Ald. Dorff, seconded by Ald. Galvin to approve the agenda. Motion carried.
3. Approval of the minutes from the February 13, 2017 meeting.
A motion was made by Ald. Dorff; seconded by Ald. Zima to approve the minutes from the February 13, 2017 meeting. Motion carried.
4. Consideration with possible action on an appeal by Jillian Stitman to the denial of her Operator License application.

Jillian Stitman was not present at this time. Motion made by Ald. Zima; seconded by Ald. Galvin to deny an appeal by Jillian Stitman to the denial of her Operator License application and to reapply if she is still interested in obtaining one.

5. Consideration with possible action on an application for a "Class B" Combination License by Catch-22 Enterprises, LLC at 1699 E. Mason St. (Currently Main & Mason, LLC).

The Law and Police departments had no objections.

A motion was made by Ald. Dorff; seconded by Ald. Galvin to approve an application for a "Class B" Combination License by Catch-22 Enterprises, LLC at 1699 E. Mason St. (Currently Fitzgerald's)

6. Consideration with possible action on an application for a “Class A” Liquor and a Class “A” Beer License by Tikapur Petroleum, LLC at 2056 Main St. (Currently Main & Mason, LLC)

The Law and Police departments had no objections.

Ald. Zima asked if this was in a residential area.

Ald. Galvin said the business is across the street from an apartment complex.

Ald. Zima addressed concerns of its location.

Ald. Scannell said the Committee could seek feedback from the alder on the Council floor at next Tuesday’s City Council meeting.

Motion made by Ald. Dorff; seconded by Ald. Galvin to approve an application for a “Class A” Liquor and a Class “A” Beer License by Tikapur Petroleum, LLC at 2056 Main St. (Currently Main & Mason, LLC). There were no objections and motion carried.

7. Consideration with possible action on an application for a Class “A” Beer License by Tikapur Petroleum, LLC at 2115 Main St. (Currently Main & Mason, LLC)

The Law and Police departments had no objections.

Motion made by Ald. Dorff; seconded by Ald. Galvin to approve an application for a Class “A” Beer License by Tikapur Petroleum, LLC at 2115 Main St. (Currently Main & Mason, LLC). There were no objections and motion carried.

8. Consideration with possible action on an appeal by Christopher Daley regarding his dog, previously discussed at the Feb. 13 P&W meeting and placed on hold.

Asst Cty Atty Faulds recapped from the Feb. 13 meeting. As stated at last meeting, the dog has been declared dangerous by Officer Meves, and the owner Christopher Daley appealed the decision. Feb. 13 was the hearing where the facts were presented to the Committee. New information has come forward since the last meeting. Asst Cty Atty Faulds presented an e-mail sent to the Committee members and entered it into the record.

The e-mail from the Green Bay Police Department stated on Feb. 18, Daley’s dog was loose in his yard when it attacked another dog that was on a leash, as it was being walked by its owner on the sidewalk. The Police Department learned of the attack on Feb. 21 and Animal Control Officer Meves issued a citation and seized Daley’s dog, which is now secured at the Bay Area Humane Society.

Asst Cty Atty Faulds noted Mr. Daley was not present at meeting.

Ald. Dorff and Ald. Galvin moved to denied.

Ald. Zima said he felt very uncomfortable last meeting and said the only reason it went unanimous was that the dog was to leave the city during the decision. The decision was placed on hold so the owner had an opportunity to make an area for the dog to keep her confined. Ald. Zima was in full support of the motion of denial.

Asst Cty Atty Faulds said the Committee has to put into the record the findings of fact on why it is or is not declared dangerous, and the motion one way or another to ensure the record is clear.

Ald. Zima suggested: "In light of the fact the dog has been in four biting incidents in the past year and the owner did not take the necessary precautions, we are declaring the dog dangerous."

Ald. Dorff asked Officer Meves how this has happened and a possible explanation.

Officer Meves said the dog Reba was running loose when the incident happened. A gentleman was walking a leashed dog by the residence. It was a little morkie, a Maltese Yorkie mix, which is a small dog. Reba was running loose and ended up pinning the dog down. Reba caused two pretty big bites to her. The owner of the morkie went to open the dog's mouth and at that point has sustained some scraps. He wasn't sure if it came from the dog during that or while he was down on the ground wrestling the dog. It was a struggle to get the dogs away as he had to hit and kick Reba to get the dog off his. There was no fence made at the time of the incident and the incident happened on the sidewalk. Mr. Daley had given a gift card to the gentleman and asked him to not call the Police.

Officer Meves said she was informed of the situation on a Schmitt Park neighborhood blog. His wife posted a blog that read beware of dog. She posted this blog and everyone said you needed to contact Animal Control. Officer Meves said she reached out to the owners. She confirmed it and met with them and assessed the situation.

Officer Meves then immediately seized the dog, who is now at the Bay Area Humane Society on hold.

Ald. Dorff asked what happens to the dog now.

Officer Meves said based on the Committee's decision tonight, if the dog is declared dangerous it cannot remain in the city. But during this decision process, the dog was not supposed to be in the city. Officer Meves said Daley did

construct a 4x4 makeshift fence, which Officer Meves was able to lift up the bottom of the fence.

If he doesn't reclaim the dog within seven days, Reba would have to be put down. Officer Meves said Daley was considering having the dog stay with his brother in California.

Ald. Zima asked if Daley was cited.

Officer Meves said yes, he was recited for "Animal not attended within five-feet of right away."

Asst Cty Atty Faulds added the findings of fact should meet the elements of section 8.105.

Ald. Dorff asked if the fourth incident was off the owner's property. Officer Meves replied it happened on the sidewalk.

Ald. Zima thought there was a more serious violation as he did not have the dog leave the city and defied the Committee's ruling. It was Ald. Zima's understanding that the dog would leave the City while proper confinements were put in place and the Committee was to review the area.

Ald. Dorff said the Committee couldn't make the owner do it, but the Committee thought he would have.

Asst Cty Atty Faulds clarified that the dog did have to be outside of the city during the pending hearing. However, the Committee could not put stipulations like building a fence.

Ald. Dorff asked to do another finding of fact.

Asst Cty Atty Faulds said if the dog is considered a dangerous dog, then it would also have to be qualified as a menacing dog.

Ald. Scannell suggested starting with Ald. Zima's motion that the animal has four incidents of injuring animals and people while not on the owner's property.

The final motion became: The animal has four incidents of injuring animals and people while not on the owner's property, we declare the animal a dangerous dog that causes injury in a menacing fashion. Therefore, it meets the definition of a dangerous dog and therefore, needs to leave the city.

Motion by Ald. Zima; seconded by Ald. Galvin To deny the appeal of Christopher Daley, 2747 Humboldt Rd., to the declaration of his dog being labeled as a dangerous dog under the City of Green Bay Municipal Code 8.105, Sec., (1), (2),

& (3), based on the adopted findings of facts and conclusions of law announced at the meeting. Motion carried.

9. Consideration with possible action a request by Brenda Staudenmaier to rescind the resolution authorizing fluoride chemicals in public drinking water, previously discussed at the Jan. 30 P&W meeting and placed on hold.

Captain LePine was excused for the remainder of the meeting.

Ald. Zima said he did watch a film that was suggested at last meeting. After watching, Ald. Zima asked if fluoride was good for teeth, then why was it being ingested into the whole system. He previously thought fluoride was good, but was no longer convinced it was. He thought fluoride can be found in other ways.

Ald. Scannell asked if the staff had items to provide.

Nancy Quirk, General Manager of Green Bay Water Utility, addressed the committee.

Quirk spoke with a person from the Water Department of Montello, a community that no longer has fluoride in their water supply. The gentleman said money was the reason why fluoride was given up. They had other things they had to take care of in their water.

Ald. Zima recalled when smoking was a positive thing. Ald. Zima said those against fluoride made a very compelling argument.
Motion made by Ald. Dorff; seconded by Ald. Galvin to open the floor.

Ald. Scannell said this is City Business. The goal is to give the Committee answers and input. Since there was already an open forum, if the information is repetitive, he would let them know. The goal is take the public's information, discuss amongst ourselves and make a decision.

Jillian Stitman addressed the Committee and if would be able to speak on behalf of her Operator License denial.

Motion made by Ald. Zima; seconded by Ald. Dorff to reconsider an appeal by Jillian Stitman to the denial of her Operator License application.

4. Consideration with possible action on an appeal by Jillian Stitman to the denial of her Operator License application.

Motion by Ald. Dorff; seconded by Ald. Galvin to open the floor.

Jillian Stitman
2185 King James

Stitman said she wanted to appeal the denial since she was denied on a felony that occurred 10 years ago. She is almost 35 years old and has changed since then. She has not had a record since that occurrence. Since then, she graduated from college twice.

In August 2013, she was hit by a train. It took a year to recover. She had a brain injury, which has placed limitations on the jobs she can do. Currently, she is a server. The promotion would mean a better income.

Stitman said she made a mistake 10 years and it is unfair to use something she did one time against her. She is completely different now.

Ald. Dorff clarified that if the law states if a person has a felony, it is required that the operator license be denied. However, the Committee can overrule that.

Ald. Dorff asked where Stitman works.

Stitman said she works at Applebee's.

Motion made by Ald. Dorff; seconded by Ald. Galvin to close the floor.

Motion made by Ald. Dorff to approve the appeal by Jillian Stitamn to the denial of her Operator License application, contingent on a receiving a letter from her employer.

Ald. Scannell suggested amending the motion and asked that the Committee not require an employer's letter.

Motion made by Ald. Dorff; seconded by Ald. Galvin to approve an appeal by Jillian Stitman to the denial of her Operator License application. There were no objections and the motion carried.

The Committee returned to Agenda Item #9.

Motion made by Ald. Dorff; seconded by Ald. Galvin to open the floor.

Brenda Staudenmaier: 423 S. Van Buren St.
Staudenmaier spoke to the Committee regarding an update on her petition to the EPA requesting fluoride to be removed in the water on a national level.

Staudenmaier said the EPA denied their petition. She said the EPA was not ready to let go of the outdated assumptions on fluoride.

The petition presented evidence demonstrating that fluoride is a neurotoxin being ingested by children and vulnerable populations. They also presented that fluoride has little benefit when swallowed. Any risks from exposing fluoride chemicals are unnecessary.

She believes that an impartial judge will agree. She will challenge the EPA's denial in court and is confident on the merits of the petition.

Staudenmaier said fluoride is a neurotoxin. The question therefore, is not if fluoride damages the brain, but at what level does it do the damage.

Staudenmaier said the 2006 National Research Council said fluoride can lead to renal, endocrine and gastrointestinal disease. She also noted that it is immoral to be mass medicated and is contradictory to modern principals of pharmacology. Ald. Zima clarified that the communities are allowed to make a decision on fluoride and the petition was based on a national level.

Staudenmaier asked Quirk about the NSF regulations and Green Bay's compliance of water quality.

Quirk discussed the numeric formula used to come to the value. Quirk said Green Bay's water does meet the standards of NSF and AWWA Standard B703.

David Dunlop at 410 N. Ashland:

He said a number of municipalities have abandoned the standard of fluoride. He asked if we are following the leaders or behind the curve. The public policy should be looked at and the scientific evidence be reviewed. He asked the Committee to look at those who took fluoride out of the water and look at their reasoning. He also asked the Committee to review if the municipalities have been cited.

Michael Finney, 2428 Bay Settlement Road, spoke against fluoride in our water. He mentioned the 2006 study that showed there was a concern on fluoride. Fluoride is an endocrine destructor, meaning it is having an effect.

Ald. Dorff asked more for information on the 2006 statements from the National Academy.

Finney said it was a 507 page study done by 12 leading experts in the National Academy of Science that is unbiased. The study stated fluoride has the ability to effect function of the brain and the body by direct and indirect means. He said fluoride is an endocrine destructor. Fluoride can also cause decreased thyroid function and kidney disease.

Keith Decker, 2421 Mountain Trail, spoke against fluoride in Green Bay's water.

He handed an e-mail to the committee regarding the studies to show the cause of concern of fluoride. He believes a mass medication of water is fundamentally wrong.

David VanderLeest 146 Alpine Dr.

He said there is a difference in putting fluoride on topical versus drinking it. He suggested putting the decision to a referendum to place the decision in the hands of the community.

Nicole La Forge at 4481 Nicolet Drive spoke against fluoride in our water and mass medication. She noted eight different cities in Wisconsin have abandoned fluoride in the water.

Robbyn Kuester, Fluoridation Program Coordinator WI Department of Public Health spoke in favor of fluoride in our water. She said fluoridation of water is safe and effective.

Kuester said expert panels have considered the available evidence and found a lifetime of drinking fluoridated water at the optimal level results in no adverse condition for any groups of individuals or individuals.

She addressed the denial of Staudenmaier's petition and read from the EPA's 40-page response as to why it was denied.

She said 90 percent of the population in Wisconsin has access to fluoridated water. The decision is a decision made on the local level. Those who have stopped using fluoride are typically smaller communities with outdated infrastructure and the cost to update the infrastructure and cost of fluoride is too much.

She also noted fluoridation water programs are growing and not decreasing.

Ald. Zima asked if Kuester could elaborate about communities that don't have fluoridation in their water and the dangers these communities have subjected themselves to.

Kuester said there is a health and economic impact.

Mary Rosner, a resident at 1868 Dousman St., spoke in favor of fluoride in our water.

Dr. Rick Vander Heyden, a dentist in Allouez, spoke in against of fluoride in our water. He asked himself as a dentist if he should do the fluoride treatments or not. He found the little bit people could benefit from was not worth the risk. The risk to reward was just not there.

Ald. Zima asked if the amount of fluoride in our water is doing any good or if it is the brushing and flossing and care.

He said it is the proper teeth care that helps and not the water.

Dr. Mark Moss, the State Dental Director, spoke in favor of fluoride in our water.

He said it is good to be skeptical, however, look at the best evidence out there.

Ald. Galvin asked Moss's opinion on the studies presented by those against fluoride in water.

Dr. Moss stated that it is important to look at the different variables like biasness, measurement, selection and confounding, and noted there is no perfect study.

Ald. Zima asked Moss to elaborate on the study of the fluoride and osteosarcoma.

Dr. Moss mentioned there was an animal study that raised a lot of concerns. The study was based on just male rats. There were questions if the study on if it was a fluke or solid evidence. The research community found it to no be evidential.

Ald. Zima asked if they need fluoride all the time or if it could be something that just once a week would be fine. He expressed concerns of drinking it.

Dr. Moss said that in his mind it is safe.

Jenna Linden, Clinical Director of Oral Health Partnership, spoke in favor of fluoride in our water.

She said fluoride can help tooth decay by 25 percent. One way of reaching children and the population is by fluoridating water. We cannot guarantee compliance and fluoridation in water can help.

Chris Le Roy, 2760 Humboldt Rd., spoke against fluoride in our water. He brought a tube of common toothpaste and read the warning label. He said he does not use the toothpaste with the fluoride anymore. He mentioned he buys bottled water, but does like to take a bath nightly. Fluoride is going into the body through our skin. He does not like it in the water supply.

Dave Thompson, a practicing dentist in Green Bay, spoke in favor of fluoride in our water. He said it is the most positive and impactful public health measure that has taken on this country in the last 50 years.

Ald. Scannell asked if anyone would like to speak on the issue.

Keith Decker-

Decker spoke in regards to Moss's information. He said that there are large professional prestigious groups that are against fluoride as well. There are authorities before and against and asked the committee to see the reasonable cause of concern.

Staudenmaier asked if it is worth it to expose your whole body to a neurotoxic substance to save a ½ or one cavity.

Tom Nockerts, a Green Bay Dentist, spoke in favor of fluoride in our water. Fluoride is geared towards the segment of the population that does not get to the dentist.

Ald. Wery spoke to the Committee and asked the information be passed to the rest of the Council to help make an informed decision.

Vander Leest of Alpine Drive spoke before the committee. He asked if there are any studies in the advances of dental health. He recommended having a referendum to let citizens decide.

Motion made by Ald. Dorff; seconded by Ald. Galvin to close the floor. Motion carried.

Motion made by Ald. Galvin; seconded by Ald. Dorff to take a recess. Motion carried.

Motion by Ald. Galvin; seconded by Ald. Dorff to return to regular order. Motion carried.

Ald. Scannell said he did not support taking fluoride out of Green Bay's water at this time. He said there are a lot of studies available, but the most prominent scientific establishments support fluoridating water.

He noted science is a community and not an individual exercise. As more research is presented his decision could change at a later time. At this time, he felt it is the wrong move to remove fluoride.

Ald. Scannell mentioned that chlorine is added to our water to prevent cholera and typhoid, which is for the greater good. He noted it is a balancing act between respecting individual rights and helping the community. Until there are other options, it is in the benefit of the community to keep fluoride in the water.

Ald. Zima said there are an increasing number of professionals questioning the established view that fluoride is good. He said he took a community member's challenge of watching at least five minutes of a video. He ended up listening to the whole video. He felt there are questions that are credible on the opposite side of fluoridation.

He said previously, he did drink the tap water because it comes from Lake Michigan and thought it was probably good for him. He didn't feel it did any serious harm that he knew of, but can't explain all of his aches and pains.

He hoped for an ongoing discussion about fluoride. He noted all the professionals are not on one side, but rather both.

Ald. Zima made a motion to review again in a month and have a debate and acknowledge if there is something to this or not. There was no second. Motion failed.

Ald. Dorff said the full Council will want to weigh in on the decision to remove fluoride. Council is where the decision is to be made and asked people to attend the Council meeting to express their opinion.

Ald. Dorff didn't like the idea of having a referendum to make the decision. She said the community would not have the advantage of listening to expert witnesses. She felt the people with the most money would have the most commercials and advantage.

Ald. Dorff didn't like the idea that keeping fluoride in our water is a conspiracy theory. She watched one of the videos and found there were some leaps in their conclusions.

Ald. Dorff quoted Dr. Moss stating "It's good to be skeptical." She said more research needs to be done and a risk/benefit analysis be reviewed. Ald. Dorff suggested to keep doing what you are doing, but never stop questioning.

Ald. Dorff noted how tobacco was once thought to be helpful. Her mother was smoking while pregnant and that was considered okay. She said obviously, society has come a long way.

Ald. Dorff is not convinced she wanted to move away from the resolution currently in place. However, she is willing to listen and continue studying.

Ald. Galvin said the other three alders expressed how he feels. He noted there are passionate people on both sides. Ald. Galvin referenced issues with windfarms in Brown County. He noted the County has struggled on what to do with that.

Ald. Galvin said he was not in support of eliminating fluoride in our drinking water at this time. It appears to be a benefit throughout the community. He said he saw the effect of tooth decay in his job. He said he can't support removing it, but the City needs to keep doing research and moving forward so we are doing what's best for the citizens.

Ald. Zima suggested an ongoing discussion for the next couple of years, like the County has done with windmills.

Motion made by Ald. Galvin; seconded by Ald. Dorff to receive and place on file a request by Brenda Staudenmaier to rescind the resolution authorizing fluoride chemicals in public drinking water. Alders Galvin, Dorff and Scannell voted yes to receive and place on file. Ald. Zima voted no.

Motion to adjourn made by Ald. Dorff; seconded by Ald. Galvin. Motion carried.

Meeting adjourned at 8:08 p.m.

November 4, 2020

Re: Docket: EPA-HQ-OPPT-2016-0763-0001; FRL-9959-74

Dear Administrator Wheeler:

On November 22, 2016, the undersigned Petitioners submitted a Citizen Petition under Section 21 of the Toxic Substances Control Act ("TSCA"), requesting that the EPA prohibit the addition of fluoridation chemicals to drinking water in order to protect the public, including susceptible subpopulations, from fluoride's neurotoxic risks. After the EPA denied this petition, the Petitioners brought suit in the Northern District of California to challenge EPA's denial. Following a bench trial in June of 2020, the Court stated that EPA had used an incorrect standard in assessing the evidence that the Petitioners had presented. (6/17 Trial Tr. 1131:5-9, 1132:20-21, 1137:20-23.) The Court also noted that much of the evidence that the Petitioners relied upon at trial—including recent studies funded by the National Institutes of Health (NIH)—was not yet available at the time EPA denied the Petition. (Appendix A at 4.) In light of these facts, the Court asked Petitioners to re-submit evidence to the EPA in order to give the Agency an opportunity to give the evidence a "second look" using the "proper standard" at the administrative level, which the Court "urged" the EPA to do. (6/17 Trial Tr. 1131:17-19; Appendix A at 5.)

Pursuant to the Court's request, the Petitioners are hereby submitting this Supplement to their Petition and requesting that EPA reconsider its denial of the Petition based on the information presented herein.

EPA HAS THE AUTHORITY TO RECONSIDER ITS DENIAL OF A SECTION 21 PETITION

EPA has the inherent authority to reconsider its denials of Section 21 petitions, as the EPA itself has repeatedly acknowledged. The EPA has explained that: "Although TSCA does not expressly provide for requests to reconsider EPA denials of Section 21 petitions, 'the courts have uniformly concluded that administrative agencies possess inherent authority to reconsider their decisions, subject to certain limitations, regardless of whether they possess explicit statutory authority to do so.'" EPA Brief in *Trumpeter Swan Society v. Jackson*, 2014 WL 408986, at 23-24 (quoting *Tokyo Kikai Seisakusho, Ltd. v. United States*, 529 F.3d 1352, 1360 (Fed. Cir. 2008)). As the EPA has explained, "the power to reconsider is inherent in the power to decide." *Id.* at 24 (quoting *Albertson v. FCC*, 182 F.2d 397, 399 (D.C. Cir. 1950)).

Consistent with its inherent power to reconsider where, as here, the petitioners seek the same relief as in prior denied petitions, the EPA has repeatedly treated such "new" citizen

petitions as “motions for reconsideration.” See, e.g., *Walker v. U.S. E.P.A.*, 802 F. Supp. 1568, 1572–73 (S.D. Tex. 1992) (describing how EPA treated a new Section 21 petition which “requested exactly the same rule change” as a previous petition as a “motion to reconsider”); Brief for EPA in *Trumpeter Swan Society v. Jackson* (No. 12-929, D.D.C. 2012), 2012 WL 4844872 (“EPA’s treatment of the Second Submission as a motion for reconsideration rather than as a TSCA section 21 petition was entirely consistent with the language of the Act.”).

As EPA’s own words and actions over the past four decades make clear: the Agency has the authority to reconsider its prior denials of Section 21 petitions. For the reasons stated herein, therefore, Petitioners request that EPA reconsider its denial of their Petition.

GROUND FOR PETITIONERS’ REQUEST FOR RECONSIDERATION

1. EPA Used an Incorrect and Impermissibly Stringent Standard of Proof

At the close of trial in June 2020, the Court observed that EPA has subjected Petitioners’ evidence to an incorrect standard of proof. As the Court noted, “EPA appears to have applied a standard of causation which, from my read of TSCA, is not accurate. . . . It’s not the proper standard.” (6/17 Trial Tr. 1131:5-9.)

TSCA commands that EPA protect against “unreasonable *risk*,” which exists when human exposure to a toxicant is *unacceptably close* to the estimated hazard level. (6/10 Trial Tr. 471:11-472:9.) At trial, EPA confirmed that “EPA does not require that human exposure levels exceed a known adverse effect level to make an unreasonable risk determination under TSCA.” (Appendix H at 4.) Thus, EPA does not require proof that human exposures under a given condition of use *cause* the hazard. In fact, Dr. Tala Henry agreed at trial that EPA has “*never once in any of its risk evaluations to date under Section 6 used a causation standard.*” (6/16 Trial Tr. 987:6-8.) Despite this, Dr. Henry admitted that EPA held Petitioners to a burden of proof where Petitioners needed to prove that human exposure to fluoride in water at 0.7 mg/L *causes* neurotoxicity. (6/16 Trial Tr. 985:15-987:2.) Dr. Henry thus made the extraordinary admission that EPA “held the plaintiffs to a burden of proof that EPA has not held a single chemical under Section 6 before.” (6/16 Trial Tr. 987:16-19.)

The fact that EPA used the wrong standard of proof to assess Petitioners’ evidence is a reason for EPA to reconsider its denial of the Petition. As the Court noted at the end of trial: “But my main point is that, really, I would hope that the agency would take a serious look, *apply the proper standard*, and look at this new evidence.” (6/17 Trial Tr. 1137:20-22)

2. Each of the Limitations that EPA Identified with the Fluoride/IQ Studies in the Petition Have Now Been Addressed by High Quality Studies Funded by the NIH

In its denial of the Petition, the EPA criticized the human studies that Petitioners cited on three primary grounds: (1) the studies were cross-sectional and thus “affected by antecedent-consequent bias”;¹ (2) the studies failed to adjust for potential confounding factors; and (3) the studies failed to adequately establish a dose-response relationship between fluoride and

¹ According to EPA, “the antecedent-consequent bias means it cannot be determined whether the exposure came before or after the health effects, since both are evaluated at the same time.” (Fed Reg, Vol. 82, No. 37, p. 11882.)

neurotoxicity.² (Fed Reg, Vol. 82, No. 37, p. 11882-83). In light of these limitations, EPA agreed with Choi et al. (2012) that *“further research should formally evaluate dose-response relationships based on individual-level measures of exposure over time, including more precise prenatal exposure assessment and more extensive standardized measures of neurobehavioral performance, in addition to improving assessment and control of potential confounders.”*

The very type of research that EPA stated was necessary to address the limitations of the Petition has now been conducted and confirms a significant dose-response relationship between fluoride exposure and neurocognitive harm. (Appendix B at pp. 16-18.) EPA's criticisms of the human studies in the Petition are thus no longer applicable to the current evidence base.

Following EPA's denial of the Petition in February 2017, a series of prospective cohort studies funded by the National Institutes of Health (NIH) were published which evaluate the impact of individualized measurements of prenatal and early-infant fluoride exposure on standardized measures of neurobehavioral performance between ages 4 and 12 (Bashash 2017, Bashash 2018, Green 2019, Till 2020).

These NIH-funded studies address each of EPA's three criticisms of the studies in the Petition. First, the studies measured exposure prior to the onset of dysfunction and are therefore not affected by “antecedent-consequent” uncertainty. (Appendix B at pp. 90-91 ¶¶ 475-476.) Second, the studies address EPA's concern that the relationship between fluoride and neurodevelopment may be an artifact of confounding by extensive controlling for potential confounders (e.g., socioeconomic status, maternal education, and exposure to other neurotoxins, including lead and mercury). (*Id.* at pp. 31-32 ¶¶ 165-68). Third, the studies scrutinized the dose-response relationship and found it to be linear across the range of doses relevant to water fluoridation. (*Id.* at p. 91 ¶ 479.)

There is no dispute that the NIH-funded studies are well designed and well conducted. Indeed, EPA agreed at trial that these studies “are the most methodologically reliable human studies to date on the impact of fluoride on neurodevelopment.” (Appendix H at 3.) EPA's retained epidemiologist, Dr. Ellen Chang, concurred in this assessment. (6/15 Trial Tr. 806:19-20, 886:6-887:3.)

Given the high quality and rigorous nature of the NIH-funded studies, it is highly significant that the NIH-funded studies have *consistently* found large and robust associations between adverse neurocognitive effects and so-called “optimal” fluoride exposure. As explained by the principal investigators of the studies (Dr. Howard Hu and Dr. Bruce Lanphear), the magnitude of fluoride's effect on IQ in these studies is on par with the effect size of lead. (Appendix B at pp. 78-79 ¶¶ 408-416 & p. 88 ¶ 465.) Dr. Joyce Donohue, the senior scientist at EPA who specializes in fluoride issues, agreed that these studies warrant a reassessment of existing fluoride safety standards. (Appendix B at p. 11 ¶ 61.)

In its August 10, 2020 order, the Court stated that the NIH-funded studies “clearly . . . warrant serious consideration by EPA.” (Appendix B at 5.) The Court cited these studies, and “the significant scientific developments that have occurred since the original petition was filed,” as reasons supporting a reassessment by EPA. (*Id.*) The Court “urge[d]” EPA to give “due

² According to EPA, the “lack of a dose-dependent increase in effect with increasing exposure is a critical limitation of these data.” (Fed Reg, Vol. 82, No. 37, p. 11883.)

consideration” to these scientific developments, and the “substantial scientific evidence proffered at trial.” (*Id.*) Plaintiffs have attached the Court’s order as **Appendix A**.

Consistent with the Court’s request, Petitioners urge EPA to reconsider its denial of the Petition based on the evidence presented at trial, including, but not limited to, the NIH-funded studies showing significant adverse associations between “optimal” fluoride exposure and reduced IQ. To facilitate EPA’s review of the trial record, Petitioners have attached their detailed summary of the trial evidence as **Appendix B**.³ Petitioners have also attached a copy of the NIH-funded studies as **Appendix C**.

3. The National Toxicology Program Has Concluded that Fluoride Is a Presumed Human Neurotoxicant that Lowers IQ in Children

Petitioners’ contention that fluoride is a neurotoxicant has gained powerful new support from the National Toxicology Program’s (NTP) recently revised systematic review and meta-analysis. Based on the NTP’s findings and the state of current science, the recently retired director of the NTP, Dr. Linda Birnbaum, has stated that “it is time to protect those who are most vulnerable,” including pregnant women and bottle-fed infants.⁴

A. NTP Agrees that Fluoride Is a Likely Neurodevelopmental Hazard to Humans

On September 16, 2020, the NTP released its *Draft Monograph on the Systematic Review of Fluoride Exposure and Neurodevelopmental and Cognitive Health Effects*. The Monograph is a revised version of a draft issued in October 2019, and incorporates the recommendations made by a committee of the National Academy of Sciences (NAS). After making the changes recommended by the NAS, the NTP reconfirmed its conclusion that “fluoride is *presumed to be a cognitive neurodevelopmental hazard to humans*.” (p. 2)

The NTP’s hazard conclusion is based on the fact that “the human body of evidence provides a consistent and robust pattern of findings that higher fluoride exposure (e.g., >1.5 mg/L in drinking water) is associated with adverse effects on neurocognitive development, including lower intelligence quotient (IQ) in children.” (p. 2) In light of this “consistent and robust pattern of findings,” the NTP has a “low expectation that new studies would decrease the hazard conclusion.” (p. 68)

The NTP’s findings are based not only on a thorough systematic review, but also the most comprehensive meta-analysis of fluoride neurotoxicity ever conducted. The NTP’s meta-analysis, which included 46 studies, is consistent with the findings of the meta-analysis that Petitioners relied upon in their Petition (Choi 2012) and shows an average difference in IQ between high- and low-fluoride communities of approximately 7 IQ points (SMD = -0.50). (p. 49) As the NTP notes, “The random-effects pooled SMD estimate from the 46 studies included in the group-level meta-analysis was consistent with two previous meta-analyses reporting statistically significant associations between higher fluoride exposure and lower IQ in children.”

³ Petitioners will be submitting the trial record to the EPA under separate cover, including Trial Transcripts, Petitioners’ expert declarations, Petitioners’ exhibits, and the written discovery materials that Petitioners entered into evidence.

⁴ Dr. Birnbaum’s statement, which was co-authored by Dr. Bruce Lanphear and Dr. Christine Till, was published as an Op-Ed in *Environmental Health News* on October 7, 2020. It can be accessed online at: <https://www.ehn.org/fluoride-and-childrens-health-2648120286.html> Petitioners have also attached a copy as Appendix E.

(p. 71) This consistent adverse association remained after extensive refinement, including a subgroup analysis where the NTP limited the analysis to the 9 higher quality studies at lowest risk of bias. (p. 71).

B. The Relationship Between Fluoride and Neurotoxic Effects Is Unlikely to Be Explained by Confounding or Other Issues of Methodology and Bias

The NTP reached its hazard conclusion for fluoride after carefully considering issues of study quality and bias, including potential confounding, publication bias, translation bias, and the validity of exposure and outcome assessments. Each of these methodological issues were raised at trial by EPA to question the confidence in the numerous studies reporting neurotoxicity from fluoride exposure. Importantly, the NTP's report makes clear that none of the issues identified by EPA at trial warrant a downgrade in the confidence that fluoride is a human neurotoxicant. In other words, the issues identified by EPA at trial do not explain the overwhelmingly consistent association between fluoride and neurotoxic harm.

Potential Confounding: The NTP concluded that "the consistency of the results among the lower risk-of-bias studies indicates that confounding is not a major concern in this body of evidence." (p. 40) In support of this, the NTP noted that "Seven of the lower risk-of-bias studies confirmed the robustness of the results by conducting sensitivity analyses." (p. 40) Further, the NTP observed that "None of the sensitivity analyses adjusting for additional confounders found meaningful shifts in the association between fluoride exposure and IQ or other measures of cognitive function." (p. 40).

Exposure Assessment: The NTP concluded that "In general, there were few or no risk-of-bias concerns regarding exposure assessment in the lower risk-of-bias studies." (p. 44) The NTP explained that "Many of the lower risk-of-bias studies used individual urine or water measures with appropriate analyses." (p. 44). While the EPA questioned the use of urine fluoride as an exposure metric for fluoride at trial, the NTP found that "many studies provide evidence to suggest that urinary fluoride is a reasonable measure of exposure." (p. 44)

Outcome Assessment: The NTP found that "The lower risk-of-bias studies have few concerns regarding outcome assessment." (p. 45) With the exception of a small handful of the low risk-of-bias studies, "the remainder of the studies used appropriate measures of IQ or other cognitive effects for the study population." (p. 45) Moreover, "Seventeen of the studies reported blinding of the outcome assessors or correspondence with the study authors indicated that it was not likely an issue." (p. 45)

Publication Bias: The NTP's meta-analysis assessed the presence and impact of publication bias. Importantly, the NTP found "no publication bias among the lower risk-of-bias studies." (p. 66) Although the NTP did find potential publication bias among higher risk-of-bias studies, "a trim-and-fill analysis estimated that, in the absence of publication bias, the negative direction of effect and statistical significance remained." (p. 66) In light of these findings, the NTP concluded that publication bias is not an issue that warrants downgrading the confidence in the fluoride database. (p. 66)

Translation Bias: The NTP also addressed a concern that EPA raised at trial that the translations of Chinese studies that the Fluoride Action Network (FAN) has conducted may represent a biased cross section of Chinese research by omitting no-effect studies. (p. 22) To assess this, the NTP conducted its own systematic search of Chinese research databases. In total it found 16 studies that had not been translated by FAN, but noted that 15 of these studies

“contained results that would likely add to the body of evidence showing a negative association between fluoride exposure and primary neurological outcomes.” (p. 22) In other words, the non-translated studies further *support* the hazard conclusion, rather than detract from it. If anything, therefore, FAN’s translations *understate* the current extent of Chinese research showing neurologic harm from fluoride exposure. Moreover, the only “no-effect” study that the NTP identified (Kang 2011) is a study that FAN has identified on its website (p. 22), and which the Petitioners actually included in their Petition as study number 123. There is thus no basis for the assertion that there has been a selection bias in the Chinese studies which have been translated.

C. *The NTP Identified a Large Number of Low Risk-of-Bias Studies Linking Fluoride to Neurotoxicity*

The NTP’s systematic review identifies a very large number of studies that have associated fluoride with neurotoxic effects. In total, the NTP identified 92 human studies that have investigated the impact of fluoride on neurodevelopment, which the NTP describes as a “relatively robust” evidence base. (p. 25) Even after excluding studies that have a higher potential for bias, the number of available human studies was still notably large. In total, the NTP identified 31 human studies on fluoride and neurodevelopment that it found to have a relatively low potential for bias (p. 25) and the vast majority of these studies found significant associations between fluoride and adverse effects. This highlights that the association between fluoride and neurotoxicity is not the artifact of poor study design or bias, as EPA argued at trial.

D. *The NTP Has Judged the New Zealand Studies that EPA Has Relied Upon to Be at High Risk of Bias*

At trial, the EPA placed great emphasis on the null findings from a series of studies from New Zealand (Shannon 1986, Spittle 1998, Broadbent 2015). EPA’s retained epidemiologist, Dr. Ellen Chang, identified the New Zealand studies as three of the ten studies that she gave greatest weight to in her causal analysis. (Chang Trial Decl. at p. 40 ¶ 182.)

In sharp contrast to EPA’s assessment and in agreement with Petitioners’ experts, the NTP identified the Shannon and Broadbent studies as suffering from a high risk of bias and gave them little weight in its analysis.⁵ In addition, the NTP excluded the Spittle study altogether because it was a mere abstract. (p. 10)

The NTP’s assessment of the New Zealand studies shows that the EPA has given too much weight to these studies. In reconsidering the Petition, therefore, the EPA should give the New Zealand studies the minimal weight they warrant.

E. *The Animal Data Supports the Conclusion that Fluoride Produces Neurodevelopmental Effects*

Based on its review of the animal literature, the NTP has determined that “The animal data do provide evidence for effects of fluoride on neurodevelopment.” (p. 70) Although the NTP found that the subset of studies on learning/memory fail to distinguish between a direct effect on cognition and a secondary effect of fluoride’s impacts on the motor/sensory systems, the NTP agrees that “There are sufficient mechanistic data [from the animal studies] to determine that

⁵ The NTP’s risk-of-bias review for the Broadbent and Shannon studies can be accessed online at: <https://hawcproject.org/rob/study/264439/> and <https://hawcproject.org/rob/study/267334/>

fluoride exposure at lower concentrations has effects on the nervous system.” (p. 71) The animal data thus support the NTP’s presumed hazard conclusion, but do not yet warrant an upgrade in the hazard identification conclusion:

“[T]he evidence of neurological effects at exposure levels more relevant to humans that is demonstrated in the mechanistic data supports the NTP conclusion that fluoride is presumed to be a cognitive neurodevelopmental hazard to humans; however, it does not provide enough evidence to increase confidence in the human body of evidence or support a higher hazard identification conclusion.” (p. 71)

A copy of the NTP’s revised Monograph is attached as **Appendix D**.

F. *The NTP’s Recently Retired Director Has Called for Measures to Protect Pregnant Women and Bottle-Fed Babies from the Neurotoxic Effects of Fluoride*

The relevance of the NTP’s findings to water fluoridation has recently been highlighted by none other than the recently retired director of the NTP, Dr. Linda Birnbaum.

On October 7, 2020, shortly after the NTP released its revised Monograph, Dr. Birnbaum issued a public statement calling for measures to protect pregnant women and bottle-fed babies from the neurotoxic effects of fluoride. Dr. Birnbaum noted that the NTP’s conclusion is “consequential,” given that “about 75 percent of Americans on community water systems have fluoride in their water.”

According to Dr. Birnbaum, “Given the weight of evidence that fluoride is toxic to the developing brain, it is time for health organizations and regulatory bodies to review their recommendations and regulations to ensure they protect pregnant women and their children.”

Dr. Birnbaum added that, “[w]e can act now by recommending that pregnant women and infants reduce their fluoride intake.”

“Given that safe alternatives are available and that there is no benefit of fluoride to babies’ teeth before they erupt or appear,” Dr. Birnbaum stated that “it is time to protect those who are most vulnerable.”

Dr. Birnbaum’s statement, which was co-authored by the two principal investigators of the NIH-funded MIREC study in Canada, is attached as **Appendix E**.

G. *Limitations and Weaknesses of NTP’s Report*

The NTP Monograph provides an exceptionally comprehensive review of the scientific literature on fluoride neurotoxicity, and provides ample support for its conclusion that fluoride is a neurotoxicant that reduces IQ. There are, however, some limitations and weaknesses with the NTP’s analysis that Petitioners wish to bring to the EPA’s attention.

First, despite the critical importance of “timing” to an evaluation of a chemical’s neurotoxicity,⁶ despite the heightened vulnerability of the fetal brain,⁷ and despite fluoride’s

⁶ See Appendix B at p. 30 ¶¶ 154-55.

⁷ See Appendix B at p. 36 ¶¶ 196-197.

known ability to pass through the placenta and get to the fetal brain,⁸ the NTP failed to separately analyze the studies that have specifically evaluated the impact of prenatal fluoride exposure. This is a troubling omission from the NTP's analysis for two reasons: (1) The studies that have examined prenatal fluoride exposure are the most methodologically rigorous studies to date (e.g., Bashash 2017, Bashash 2018, Green 2019, Till 2020, Valdez-Jiminez 2017). (2) Had the NTP separately considered the prenatal studies, it could *not* maintain the conclusion that the evidence of harm is "inconsistent and unclear" below 1.5 mg/L. Indeed, as demonstrated at trial, the prenatal studies have consistently found adverse effects at levels of exposure seen in artificially fluoridated communities. (Appendix B at p. 89 ¶ 467.)

Second, the NTP's dose-response assessment is fundamentally flawed in several critical respects. The NTP failed to utilize benchmark dose (BMD) modeling, which is the standard method for dose-response analysis, as recognized by the EPA. Instead of using BMD modeling, the NTP used a meta-analysis method that relied upon group-level data from cross-sectional studies instead of individual-level data from the highest-quality (North American) prospective studies. The NTP's curious use of group-level data in its dose-response analysis instead of individual-level data runs directly counter to EPA's methods. In fact, in EPA's denial of the Petition, the EPA specifically stated that group level data from cross-sectional studies is "unsuitable for evaluating levels of fluoride associated with neurotoxic effects and for deriving dose-response relationships necessary for risk assessment." (Fed. Reg. Vol 82, No. 37 at 11882.)

Third, the NTP's justifications for not doing a dose-response analysis of the studies with individual data do not withstand scrutiny. The NTP provided the following justification for not doing an analysis of individual-based data:

"A dose-response meta-analysis using the effect estimates reported in studies with individual-level exposure was considered. However, because of the small number of studies (n = 10), the various types of exposure metrics, and the different types of reported effect estimates that could not be combined, a dose-response meta-analysis of these studies could not be conducted." (p 253)

Each of these three asserted justifications lack merit as they apply equally to other subgroup-analyses that NTP performed as part of its dose-response meta-analysis. Specifically, the NTP did subgroup analyses that (1) pooled as few as four studies at a time, (2) pooled studies that used different exposure metrics, and (3) pooled studies with different effect estimates. (pp. 248-252.)

Fourth, against the specific recommendations of the NAS, the NTP engaged in an ad hoc and superficial analysis of the "generalizability to the U.S. population." (pp. 72-74) In its generalizability analysis:

- The NTP does not separately consider the prenatal studies, all of which have found effects at levels of exposure seen in fluoridated areas of the U.S.
- The NTP spends far more time discussing group-level data from China than individual-participant data from the North American prospective birth cohort studies.
- The NTP includes only one sentence that discusses the results of the North American prospective studies, and that one sentence misleadingly states that "Bashash et al. (2017) concluded that there was no clear association between IQ scores and maternal

⁸ See Appendix B at pp. 35-36 ¶¶ 193-195; Appendix H at 6.

urinary fluoride below 0.8 mg/L.” The NTP fails to mention that Bashash (2017) found *no threshold* in the GCI results for the 4-year-olds, which is a highly material finding.

- The NTP never once discusses the very probative findings from Green (2019) and Till (2020), where the studies specifically examined, and found adverse effects from, fluoride exposure in fluoridated communities of Canada.
- The NTP performs a crude assessment of fluoride exposure in the US, as it focuses on the fluoride concentration in water without giving due consideration to the wide range of exposures among people exposed to the same waterborne concentration.⁹ In fact, EPA’s Exposure Factors Handbook shows that 95th percentile per capita water intake is more than three times larger than the average intake and, therefore, high-end water consumers drinking water at 0.7 mg/L receive a higher internal dose than the average water consumer drinking water at 1.5 mg/L. (Pls’ Trial Ex. 25 at p. 3-4.)

The key flaws in the NTP’s generalizability analysis were identified by the NAS in its peer review earlier this year. According to the NAS:

“the discussion section of the monograph provides an informal assessment of the evidence with regard to exposure and concludes that adverse health effects are observed largely in association with exposures above those associated with water fluoridation. The basis of that conclusion is not apparent and *seems to contradict the earlier assertion that nearly all the studies are positive, including ones that evaluated groups exposed to lower concentrations.*” (NAS 2020, p. 5.)

The contradiction that the NAS identified remains in the current Monograph. Indeed, rather than the evidence being “inconsistent and unclear” at water fluoride concentrations below 1.5 mg/L, the highest quality studies (i.e., the NIH-funded prospective studies) are consistent and clear in showing effects below 1.5 mg/L.

The Petitioners have attached a more detailed analysis of the limitations and weaknesses of the NTP report in **Appendix F**.

H. Even with Its Limitations, the NTP Monograph Demonstrates that Water Fluoridation Poses an Unreasonable Risk of Neurodevelopmental Harm

Even with its limitations, the NTP Monograph demonstrates that neurotoxicity is an unreasonable risk of water fluoridation.

As discussed earlier, the EPA does not condition an unreasonable risk finding on whether human exposure equals or exceeds a known adverse effect level. (Appendix H at 4.) Indeed, EPA has “*never once in any of its risk evaluations to date under Section 6 used a causation standard*” to determine risk for a condition of use. (6/16 Trial Tr. at 987:6-8.) This is obvious upon review of EPA’s risk evaluations (both draft and final) as EPA has repeatedly made unreasonable risk findings where human exposures are well below the estimated hazard level (i.e., LOAEL or BMD), and EPA has also made unreasonable risk findings where the exposures are below the “No Observable Adverse Effect Level.”¹⁰ As but one example, EPA’s

⁹ The NTP does recognize that bottle-fed babies may consume “excessive amounts” of fluoride if they are fed formula reconstituted with fluoridated water, and that this needs to be taken into account as part of the generalizability analysis. (p. 74)

¹⁰ As the EPA explained at trial: “if human exposure levels exceed a known *no-adverse* effect level *divided by combined uncertainty factors*, EPA may make an unreasonable risk

final risk evaluation for 1-Bromopropane (1-BP) made an unreasonable risk finding for developmental toxicity among humans exposed to *80 times less* of the chemical than the estimated hazard level in animals.¹¹

In light of how EPA has defined unreasonable risk for other chemicals, it would be clearly erroneous for the EPA to conclude that fluoridated water does not pose an unreasonable risk of neurotoxicity simply because the level of fluoride added to water in fluoridation programs (0.7 mg/L) is less than NTP's estimated hazard level (1.5 mg/L). (6/10 Trial Tr. 478:18-479:19.) In fact, the margin between the so-called "optimal" level and the NTP's hazard level is precariously small and far lower than what EPA has found to be unacceptable in its other TSCA risk evaluations.

The danger of a mere two-fold margin between the hazard and exposure level is apparent when considering the wide range of susceptibility to toxic substances, including fluoride, that exists across the human population. EPA calls this range of susceptibility "intraspecies variability," and almost always applies a safety factor (i.e., uncertainty factor) to the estimated hazard level to ensure that susceptible members of the population are adequately protected. (Appendix B at pp. 55-56 ¶¶ 297-98.)

As discussed at trial, EPA uses a default safety factor of ten to protect susceptible humans. (Appendix B at p. 56 ¶ 298.) This default factor of 10 is "considered to be appropriate in the absence of *convincing data to the contrary*." (Pls' Trial Ex. 20 at p. 5-17.) EPA has used a safety factor of 10 for intraspecies variability in each of its risk evaluations under TSCA. (Appendix B at p. 56 ¶ 298.)

In the case of fluoride, there is ample evidence demonstrating substantial variability in how humans respond, including differences in toxicokinetics (e.g., people with renal impairment have increased accumulation of fluoride) and differences in toxicodynamics (e.g., people with iodine deficiency may suffer harm at lower levels of exposure than those with adequate intake). (Appendix B at p. 56 ¶ 299.) While the magnitude of human variability to fluoride is difficult to precisely quantify, the data *support* the *need* for an intraspecies uncertainty factor as opposed to providing "convincing data" *against* one. (*Id.* ¶¶ 299-300) Indeed, EPA itself has used a safety factor of 10 for intraspecies variability to protect susceptible humans from the toxic effects of sodium fluoride when it is used as a pesticide.¹² (*Id.* ¶ 301) EPA has thus recognized the appropriateness of using an intraspecies uncertainty factor of 10 for fluoride toxicity. (*Id.*)

Applying a safety factor of 10 to the NTP's estimated hazard level for fluoride neurotoxicity results in a water fluoride level of 0.15 mg/L, which is well below the concentration used in fluoridation programs (0.7 mg/L). In fact, even if the EPA only used a safety factor of 3, the safe level would still be less than the concentration used in fluoridation. It is thus clear that water fluoridation presents a risk of neurotoxicity if EPA applies its TSCA methods for risk characterization to the NTP's hazard assessment.

determination under TSCA." (Appendix H at 4.) Since the combined uncertainty factor in EPA's risk evaluations is almost always ≥ 30 , this means that EPA may find an unreasonable risk where the human exposure is 30+ times *lower* than the *no-adverse* effect level.

¹¹ Petitioners refer here to EPA's unreasonable risk determinations for bystander exposure to refrigerant flush products (Final 1-BP Risk Evaluation at pp. 316 & 345).

¹² The sodium fluoride that is used as a pesticide is the "same exact chemical" as the sodium fluoride that is added to drinking water for fluoridation. (6/10 Trial Tr. 500:8-14.)

4. Pooled BMD Analysis of the NIH-Funded Birth Cohort Data Confirms that Pregnant Women in Fluoridated Areas Are Exceeding the Dose Associated with IQ Loss

A team of scientists, including the authors of the NIH-funded studies, have recently completed a *pooled* benchmark dose (BMD) analysis of the maternal urinary fluoride data from the ELEMENT and MIREC datasets (Grandjean, et al. 2020, in review). The pooled analysis, which is currently undergoing peer review, found that the BMDL (i.e., BMCL) for the loss of 1 IQ point among 4-year-old children across the two cohorts is just **0.18 mg/L**. This is consistent with the preliminary findings presented by Dr. Philippe Grandjean at trial and is *far below the urinary fluoride levels found in pregnant women living in fluoridated areas of North America*. (Appendix B at pp. 45-47 & 68-69.) Sensitivity analyses of the pooled sample using non-linear models confirm that the *linear* model presents a reasonable approximation of the dose-response relationship.

Given that BMD analysis is EPA's preferred method for determining toxicity values and risk estimates, the new pooled analysis provides compelling grounds for EPA to reconsider its denial of the Petition. The analysis, which became publicly available on November 4, 2020, is attached as **Appendix G**.

Petitioners will also be submitting to the EPA under separate cover the regression coefficient data upon which the pooled BMD analyses are based. In addition, Petitioners will be submitting under separate cover the scatterplot data from Figures 2 and 3 of the Bashash 2017 study as extracted by WebPlotDigitizer. This data will permit the EPA to do its own BMD analyses of the data should the Agency wish to do so.

5. Millions of Americans Are at Risk of Harm as a Result of EPA's Failure to Regulate Fluoridation, Including Petitioners

One of the consequences of widely dispersing a toxicant through the environment is that susceptible members of the general public may be exposed. This is the case with fluoridation chemicals. Each year, there are approximately 2.5 million pregnancies in fluoridated areas; *in utero* exposures are thus widespread. (Appendix B at p. 78 ¶ 406.) Many of those exposed *in utero* will also be exposed during the sensitive neonatal period, with upwards of 1.9 million infants living in fluoridated areas being fed formula at least part of the time, including 400,000 infants who are exclusively formula-fed for their first six months. (*Id.*) Petitioner Organizations have members who fall within these zones of danger.

Petitioner Organizations have many members of childbearing age living in fluoridated areas who are subject to the risks identified by the NIH-funded prospective studies. The members of Petitioner Organizations include women who are currently pregnant, women who are actively seeking to become pregnant, and/or mothers of infants. This includes, but is not limited to, Food & Water Watch members **Jennifer Baugh, Jacqueline Devereaux, Brooke Errett, Leah Garland, Hanna Rodgers, Olivia Stancil, Whitney Stolman, Jessica Trader, and Chassity Woolums**. In light of the science linking early-life exposure to fluoridated water to adverse neurodevelopmental effects, each of these members is taking steps to limit their child's exposure to fluoride, including through purchasing filtered and bottled water.

EPA's failure to regulate the fluoridation chemicals in water is forcing millions of Americans, including Petitioners' members, to choose between subjecting their children to a risk of permanent neurological harm, or spending hard-earned money to avoid the water that is delivered into their homes. Petitioners implore the Agency to reconsider its denial of the Petition

so that its members, and millions of other Americans, are no longer forced to make this injurious choice.

6. EPA Erred in Considering the Purported Dental Benefits of Fluoridation in its Denial of the Petition

In its denial of the Petition, EPA cited the purported dental benefits of fluoridation as a basis for its denial. This was improper¹³ because the Amended TSCA statute forbids risk evaluations from considering “costs and other nonrisk factors.” 15 U.S.C. § 2620(b)(4)(B(ii)). In a May 11, 2020 order, the Court ruled that the statute’s prohibition on considering “costs and other nonrisk factors” extends to purported health benefits. As the Court noted, “the plain text of the statute, the structure of the statute, and its legislative history all indicate that consideration of benefits at the risk evaluation stage is inappropriate.” (Appendix H at 12.) In considering whether fluoridation presents an unreasonable risk of neurotoxicity, therefore, the EPA must not consider purported benefits as that is the province of risk management, not risk evaluation.

The Petitioners have attached a copy of the Court’s May 11, 2020 decision as **Appendix H**.

7. EPA Erred in Claiming that Petitioners Failed to Adequately Identify the Chemicals at Issue

Finally, in denying the Petition, the EPA asserted that Petitioners failed to justify treatment of fluoridation chemicals as a “category” of chemicals. (Fed Reg, Vol. 82, No. 37, p. 11888). EPA noted that Petitioners had failed to identify “the specific chemical substances that should comprise the category of fluoridation chemicals.”¹⁴ (*Id.*) Further, EPA argued that “if EPA were to grant the petitioner’s [sic] request, the Agency would become obligated to address all conditions of use of the category.” (*Id.*) During the litigation on this matter, the Court considered and rejected each of these arguments, and held that the Petitioners had adequately identified the chemicals at issue, and that there was no merit to EPA’s contention that it “would become obligated to address all conditions of use of the category.”

The Petitioners have attached the Court’s order addressing these issues as **Appendix I**.

SUMMARY

Congress enacted Section 21 to “ensure that bureaucratic lethargy does not prevent the appropriate administration of [TSCA’s] vital authority.” *Environmental Defense Fund v. Reilly*, 909 F.2d 1497, 1499 (D.C. Cir. 1990). This is precisely why the Petitioners filed their Section 21 Citizen Petition, because EPA has failed to protect the public from the dangers posed by fluoride in drinking water.

The reasons that EPA proffered for denying Petitioners’ Citizen Petition, which were questionable when written, are neither credible nor tenable in light of the aforementioned developments that have transpired since EPA’s denial. In light of these developments,

¹³ Petitioners recognize that they discussed the lack of benefits in the Petition, but that does not change the fact that the statute forbids such consideration, as Petitioners have since learned.

¹⁴ As EPA well knows, there are three chemicals used to fluoridate drinking water: hydrofluorosilicic acid, sodium fluorosilicate, and sodium fluoride.

Petitioners request that EPA reconsider its denial of the Petition and exercise its authority under TSCA to prohibit the addition of fluoridation chemicals to drinking water.

Dated: November 4, 2020

Respectfully submitted,

/s/ Michael Connett

THE PETITIONERS

ORGANIZATIONS:

Food & Water Watch (FWW) is a nonprofit membership organization that champions healthy food and clean water for all, and advocates for a democracy that improves people's lives and protects our environment. Core to FWW's mission is the belief that clean, safe water for drinking and recreational uses is a fundamental right that should be afforded to all people. FWW has over 70,000 members nationwide, including the following women of childbearing age who are concerned about the credible threat of neurological harm that fluoridation chemicals pose to their children and expected children: **Jennifer Baugh, Jacqueline Devereaux, Brooke Errett, Leah Garland, Hanna Rodgers, Olivia Stancil, Whitney Stolman, Jessica Trader, and Chassity Woolums.**

Fluoride Action Network (FAN), was founded in 2000 as a project of the American Environmental Health Studies Project, Inc. FAN is an organization of scientists, doctors, dentists, environmental health researchers, and concerned citizens working to raise awareness about the impact of current fluoride exposures on human health.

Moms Against Fluoridation is a national nonprofit with a mission to increase awareness of the unsafe and unethical practice of artificial water fluoridation in America today.

INDIVIDUALS:

Audrey Adams, a resident of Renton, Washington (individually and on behalf of her son Kyle Adams); **Kristin Lavelle**, a resident of Berkeley, California (individually and on behalf of her son Neal Lavelle); and **Brenda Staudenmaier** from Green Bay, Wisconsin (individually and on behalf of her children Ko Staudenmaier and Hayden Staudenmaier).

G.	EPA Authority and Action	107

1 **I. BACKGROUND**

2 1. Under THE Toxic Substances Control Act (TSCA), the EPA has authority to prohibit or
3 otherwise regulate the “particular use” of chemicals that present an “unreasonable risk” to human health,
4 including to susceptible subpopulations. 15 U.S.C. § 2605.

5 2. TSCA also affords citizens the right to petition the EPA to request that the Agency exercise
6 its authority under the statute to prohibit or otherwise regulate chemical uses that present an unreasonable
7 risk. 15 U.S.C. § 2620.

8 3. Pursuant to the Citizen Petition provision of TSCA, Plaintiffs filed a petition with EPA
9 requesting that the Agency prohibit the addition of fluoridation chemicals to drinking water on the grounds
10 that this particular use of fluoride presents an unreasonable risk of neurologic harm. [SOURCE:
11 Undisputed Fact No. 2; EPA Ex. 515 (Petition) at 1]
12

13 4. After EPA denied the petition, Plaintiffs commenced this *de novo* proceeding.
14

15 **II. WEIGHT OF THE SCIENTIFIC EVIDENCE**

16 5. To assess the potential neurotoxic risk of fluoridated water, EPA states that “a weight of
17 the scientific approach” should be used which identifies and characterizes “the best available science from
18 the most up-to-date scientific database of studies that have examined neurotoxicity as an effect of fluoride
19 exposure.” [SOURCE: Undisputed Fact No. 24]
20

21 6. EPA concedes that a risk assessment of fluoride neurotoxicity should not rely on the
22 Agency’s existing safety standards for fluoride because those standards were designed to protect against
23 dental and skeletal effects, not neurotoxicity. [SOURCE: Undisputed Facts No. 20-24]

24 **A. TSCA Statute**

25 7. The TSCA statute commands that EPA base its decisions under Section 6 “on the weight of
26 the scientific evidence” and “best available science.” [SOURCE: 15 U.S.C. § 2625(h), (i)]
27
28

1 8. The language of the TSCA statute tracks the general methodology that EPA has used in its
2 risk assessments since the Agency’s inception: weight of the evidence analyses that rely on expert judgment
3 to assess the best available science. [SOURCE: Thayer 6/12 Tr. 663:24-664:3]

4 9. In the approximate 50 years of EPA’s existence, the Agency has not yet completed a single
5 risk assessment that uses systematic review. To date, EPA’s risk assessments have used “narrative reviews”
6 instead. [SOURCE: Thayer 6/12 Tr. 661:19-23; 662:7-11]

7 10. Every federal environmental regulation now in existence is based on risk assessments that
8 did *not* use systematic review. [SOURCE: Thayer 6/12 Tr. 662:7-11]

9 11. Consistent with EPA’s longstanding practices, the TSCA statute does not mention nor
10 require “systematic reviews.” As EPA has noted, “systematic review is not required under the statute, only
11 a weight of the scientific evidence analysis.” [SOURCE: EPA Ex. 544 (*Risk Evaluation Rule*) at 33734]

12 **B. EPA’s Risk Evaluation Rule**

13 **1. The Rule Was Promulgated After Commencement of this Action**

14 12. Plaintiffs filed their Citizen Petition with the EPA on November 22, 2016, and, following
15 EPA’s denial, commenced the instant action on April 18, 2017. [SOURCE: EPA Ex. 515 (*Petition*) at 1;
16 Complaint, ECF No. 1]

17 13. After commencement of this action, EPA promulgated regulations that explain how EPA
18 will carry out risk evaluations under Section 6(b) of TSCA, including how EPA defines “Weight of the
19 Scientific Evidence” for its risk evaluations. [SOURCE: EPA Ex. 544 at 33726]

20 14. Under EPA’s definition, Weight of the Scientific Evidence means “a *systematic review*
21 *method*, applied in a manner suited to the nature of the evidence or decision, that uses a pre-established
22 protocol to comprehensively, objectively, transparently, and consistently, identify and evaluate each stream
23 of evidence, including strengths, limitations, and relevance of each study and to integrate evidence as
24 necessary and appropriate based upon strengths, limitations, and relevance.” [SOURCE: 40 C.F.R. 702.33]
25
26
27
28

15. The final rule that set forth this definition was published in the *Federal Register* on July 20, 2017 (“Risk Evaluation Rule”). The regulation took effect on September 18, 2017. [SOURCE: EPA Ex. 544 at 33726]

16. In *Safer Chemicals Healthy Families et al. v. United States Environmental Protection Agency*, EPA represented to the Ninth Circuit Court of Appeals that the Agency was “*not bound*” to follow the Risk Evaluation Rule because EPA had *begun* the risk evaluations at issue in that case “*before* promulgating the Risk Evaluation Rule.”¹

17. EPA has subsequently issued two guidance documents related to Section 6(b) risk evaluations under the Rule, but both documents expressly state that they are not “legally binding” and “cannot be relied on to create a substantive or procedural right enforceable by any party in litigation with the United States.” [SOURCE: EPA Ex. 538 (*Guidance to Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act*) at 2; EPA Ex. 539 (*Application of Systematic Review in TSCA Risk Evaluations*) at 9-10]

2. The Rule Gives Substantial Flexibility in the Methods EPA May Use

18. In the Risk Evaluation Rule, EPA declined to codify a definition of “systematic review,” and explained that “different weight of the scientific evidence review methods may be appropriate for different information, types of evaluations, or decisions.” [SOURCE: EPA Ex. 544 at 33734; Henry 6/16 Tr. 973:13-16]

19. The Rule states that all conditions of use “will not warrant the same level of evaluation, and EPA expects that it may, in some cases, be able to reach conclusions without extensive or quantitative evaluations of risk.” [SOURCE: EPA Ex. 544 at 33733-34]

¹ The Court may take judicial notice of EPA's position as set forth in the following brief that EPA filed with the Ninth Circuit: *Safer Chemicals Healthy Families et al. v. United States Environmental Protection Agency*, Consolidated Case Nos. 17-72260 et al., 2018 WL 3879023 at *39-40 (9th Cir. Aug. 6, 2018).

20. In the Rule, EPA states that weight of the evidence analyses may be “fit for purpose.”

21. A fit for purpose approach to risk evaluation affords EPA substantial flexibility in how it may evaluate risk in any given situation. For example, if EPA has evidence “that allows the agency to conduct the comparison of exposure to toxicity based on a fairly straightforward and simple method, it can stop there and need not do further refinement.” [SOURCE: EPA Ex. 544 at 33733-34; Henry 6/16 Tr. 973:17-25]

22. EPA has made it clear that “it’s going to be very flexible about how it determines risk” under TSCA. [SOURCE: EPA Counsel 6/17 Tr. 1133:23-24]

3. EPA’s “Pragmatic Approach”

23. Consistent with the flexible approach contemplated by the Risk Evaluation Rule, EPA has taken a “pragmatic approach” to the systematic reviews it has conducted under Section 6. [SOURCE: Thayer 6/12 Tr. 664:17-22; 665:19-667:1; Pls’ Ex. 49 (*NMP Risk Evaluation*) at 47-48]

24. Under its pragmatic approach, EPA has “accept[ed] for the most part the relevant scientific knowledge gathered and analyzed by others, except for influential information sources that may impact the weight of the scientific evidence underlying EPA’s risk findings.” [SOURCE: Thayer 6/12 Tr. 664:13-22; 665:19-667:1; Pls’ Ex. 49 (*NMP Risk Evaluation*) at 47-48]

25. EPA’s pragmatic approach to Section 6 risk evaluations is consistent with recommendations that the Agency received from the National Academy of Sciences (NAS). In 2017, the NAS recommended to EPA that its systematic reviews should build upon existing systematic reviews, rather than attempt to “reinvent the wheel.” [SOURCE: Thayer 6/12 Tr. 664:13-22; 665:20-667:1, 667:3-10; 667:24-668:9]

4. Implications, if Any, for Citizen Petitions

26. The Risk Evaluation never once mentions Citizen Petitions or Section 21. [SOURCE: EPA Ex. 544]

27. In the section of the Rule’s preamble entitled “*Does this action apply to me?*” EPA did not

1 identify citizens, citizen groups, or Section 21 petitioners. Instead, EPA identified manufacturers who may
2 have an interest in submitting risk evaluations under Section 6(b), as specifically contemplated by the
3 statute. [SOURCE: EPA Ex. 544 at 33726; 15 U.S.C. § 2605(b)(4)(C)(ii) (permitting manufacturers to
4 request risk evaluations so long as they satisfy certain threshold requirements)]

5 28. Although the Rule provided no notice of its application to citizen petitioners under Section
6 21, EPA has contended in this litigation that the Rule does apply to Section 21 petitioners, which Plaintiffs
7 dispute.

8 29. EPA has issued two non-binding guidance documents regarding the Risk Evaluation Rule,
9 but neither make any mention of Section 21, and the word “citizen” does not appear once in either
10 document. [SOURCE: EPA Ex. 538 (*Guidance to Assist Interested Persons in Developing and Submitting*
11 *Draft Risk Evaluations Under the Toxic Substances Control Act*); EPA Ex. 539 (*Application of Systematic*
12 *Review in TSCA Risk Evaluations*)]

13 30. To the extent that the Rule applies to citizen petitioners, EPA concedes that citizen groups
14 need not evaluate risk using the same exact methods as EPA. Instead, it is sufficient if citizens provide
15 “some demonstration that’s complete, clear, transparent, around whether or not the data and studies being
16 used are best available science . . . and, also, some kind of integrated weight of evidence.” [SOURCE:
17 Henry 6/16 Tr. 984:8-18]

18
19
20 **C. Dr. Grandjean’s Assessment of Risk**

21 31. For his assessment in this case, Plaintiffs’ expert Dr. Philippe Grandjean conducted a weight
22 of the evidence analysis in which he focused on the best available science. This is the same general method
23 that EPA has utilized for risk assessment since its inception. [SOURCE: Grandjean Decl. ¶ 25; Thayer 6/12
24 Tr. 663:24-664:3]
25
26
27
28

1. Reliance Upon His Prior Systematic Review

32. Although Dr. Grandjean did not conduct a formal systematic review for his assessment in this case, he has conducted a systematic review of the fluoride neurotoxicity literature in the past.

[SOURCE: Grandjean Decl. ¶ 98; Grandjean 6/9 Tr. 157:12-23; 221:23-222:7]

33. In 2012, Dr. Grandjean published a systematic review and meta-analysis of the epidemiological literature on fluoride neurotoxicity that was substantially more comprehensive than a previous review by the National Research Council. [SOURCE: Grandjean 6/9 Tr. 157:12-158:10; 159:18-20]

34. After rigorous peer review, Dr. Grandjean's systematic review was published in *Environmental Health Perspectives*, a journal funded by the National Institutes of Health and considered the premier environmental health journal in the world. [SOURCE: Grandjean 6/9 Tr. 158:22-159:6; Hu 6/8 Tr. 54:25-55:8]

35. In its denial of Plaintiffs' citizen petition in this case, EPA agreed that Dr. Grandjean's 2012 review was a "systematic review" and noted that it had "examined in detail" some of the studies cited in Plaintiffs' petition. [SOURCE: EPA Ex. 514 (*EPA Denial of Petition*) at 11882]

36. In forming his opinions in this case, Dr. Grandjean performed a comprehensive update to his systematic review instead of "reinventing the wheel." [SOURCE: Grandjean 6/9 Tr. 221:23-222:7; Thayer 6/12 Tr. 667:3-10; 667:24-668:9]

37. Dr. Grandjean's decision to build upon his prior systematic review, rather than start a new review from scratch, is consistent with the recommendations that the NAS provided to the EPA in 2017.

[SOURCE: Thayer 6/12 Tr. 667:3-10; 667:24-668:9]

2. Clear and Transparent Identification of the Best Available Science

38. Dr. Grandjean's weight of the evidence analysis satisfies the requisite methodological criteria that the EPA articulated for citizen petitioners at trial. [SOURCE: Henry 6/16 Tr. 984:8-18]

39. In his comprehensive review, Dr. Grandjean clearly and transparently identified the criteria he used for identifying the best available studies on fluoride neurotoxicity. Specifically, Dr. Grandjean places greatest weight on prospective birth cohort studies that “include real-time recording of information about exposure in early life,” with a focus on the prenatal period, “followed by subsequent clinical assessments of the child.” [SOURCE: Grandjean Decl. ¶¶ 32, 87, 90]

40. The considerations that Dr. Grandjean used for identifying the best available science are the same that he used in his 2012 systematic review. In 2012, however, there were no studies yet available that met this criteria for fluoride. As a result, Dr. Grandjean refrained in 2012 from making any conclusions about risk, and limited his conclusions to hazard. [SOURCE: Grandjean 6/9 Tr. 161:16-162:22, 165:16-19, 166:5-11; Grandjean Decl. ¶ 46]

41. The fact that Dr. Grandjean used the same considerations for identifying the best available science in his current review as he used in his 2012 review highlights the “pre-defined” nature of his criteria. This supports the credibility of Dr. Grandjean’s assessment. [SOURCE: Grandjean 6/9 Tr. 162:6-22, 165:16-19, 166:5-11]

42. Based on Dr. Grandjean’s pre-defined study criteria, the studies on fluoride and neurodevelopment funded by the National Institutes of Health (i.e., the ELEMENT and MIREC studies) are the best available science on fluoride neurotoxicity. Dr. Grandjean thus based his risk calculations on these studies. [SOURCE: Grandjean Decl. ¶¶ 24, 87, 127]

3. Reliance on Dr. Chang’s Systematic Review

43. In addition to conducting his own comprehensive review, Dr. Grandjean reviewed and evaluated the systematic review conducted by EPA’s retained epidemiologist, Dr. Ellen Chang. [SOURCE: Grandjean Decl. ¶ 22]

44. Although Dr. Grandjean and Dr. Chang disagree in their interpretation of the overall evidence, Dr. Chang’s systematic review supports the credibility of Dr. Grandjean’s literature review and

assessment. [SOURCE: Grandjean Decl. 98-103; Grandjean 6/9 Tr. 194:10-195:16]

45. First, Dr. Chang agrees with Dr. Grandjean that the ELEMENT and MIREC studies are the most reliable and rigorous studies, as does the EPA. Dr. Grandjean's risk calculations are thus based on what all sides agree are the best available studies. [SOURCE: Chang 6/15 Tr. 806:19-20 & 886:6-887:3; Undisputed Fact No. 10]

46. Second, although Dr. Chang identified 31 studies that Dr. Grandjean did not specifically discuss, all but 4 of these studies found *adverse* associations. These studies, which *support* Dr. Grandjean's assessment on the consistency of the literature, carried little weight in Dr. Chang's review. [SOURCE: Grandjean Decl. ¶ 98; Chang 6/15 Tr. 875:10-876:2]]

47. Third, the four studies that Dr. Chang identified which did not find an adverse association and which Dr. Grandjean did not discuss (i.e., He 2010, Kang 2011, Perrott 2018, and Spittle 1998) carried "little weight" in Dr. Chang's assessment, and have no bearing on either Dr. Chang's or Dr. Grandjean's opinions. [SOURCE: Grandjean Decl. ¶¶ 100-102; Chang 6/15 Tr. 876:13-877:1, 879:11-17, 878:16-879:10, 879:24:880:21]

48. Fourth, Dr. Grandjean considered Dr. Chang's assessment of study limitations and bias, and has explained why they do not provide plausible explanations for the consistent associations that have been found (in strong and weak studies alike) between fluoride and neurodevelopmental harm. [SOURCE: Grandjean Decl. ¶¶ 104-110; Grandjean 6/9 Tr. 195:11-16]

49. Fifth, Dr. Grandjean considered Dr. Chang's causal analysis of the literature under the Bradford Hill framework and identified differences in judgment that lead the two experts to reach different conclusions on causality. [SOURCE: Grandjean Decl. ¶¶ 111-125]

50. Taken together, Dr. Grandjean's comprehensive update to his 2012 systematic review coupled with his assessment of Dr. Chang's systematic review constitute an integrated weight of the evidence analysis which provides sufficient clarity and transparency as to how he identified the best

1 available science. Dr. Grandjean’s analysis thus meets EPA’s purported methodological threshold for
2 citizen petitioners. [SOURCE: Henry 6/16 Tr. 984:8-18]

3 **D. Dr. Thiessen’s Assessment of Risk**

4 51. Plaintiffs’ risk assessment scientist Dr. Kathleen Thiessen conducted a risk assessment
5 pursuant to the *Guidelines for Neurotoxicity Risk Assessment* [hereafter, “*Guidelines*”]. [SOURCE:
6 Thiessen Decl. ¶ 12]

7 52. The *Guidelines* provide extensive information and criteria for evaluating studies, and many
8 of these criteria are the same as those used in systematic reviews. A risk assessment that is compliant with
9 the *Guidelines* is thus “effectively” a systematic review. [SOURCE: Thiessen Decl. ¶ 33; Henry 6/16 Tr.
10 982:7-17; 983:17-23, 984:2-7]

11 53. As part of her risk assessment under the *Guidelines*, Dr. Thiessen conducted a structured
12 review of the animal literature using pre-defined criteria, including search terms, identification of sources
13 to search, and grounds for exclusion. [Thiessen Decl. ¶ 30-32]

14 54. The systematic review of the animal literature by EPA’s retained toxicologist, Dr. Joyce
15 Tsuji, confirms the thoroughness of Dr. Thiessen’s literature review. [SOURCE: Tsuji 6/15 Tr. 756:16-21]

16 55. Every study that Dr. Tsuji found which reported no adverse effects was also identified and
17 discussed by Dr. Thiessen. [SOURCE: Tsuji 6/15 Tr. 756:16-21]

18 **E. The Role of Expert Judgment**

19 56. Expert judgment is an inherent and inescapable aspect of risk assessment, irrespective of
20 whether the review uses a narrative or systematic methodology. [SOURCE: Thayer 6/12 Tr. 663:24-664:3,
21 664:10-16]

22 57. For their case, Plaintiffs called as non-retained experts the two senior investigators (Dr.
23 Howard Hu and Dr. Bruce Lanphear) of the NIH-funded studies on fluoride and neurodevelopment (the
24 ELEMENT and MIREC studies). Plaintiffs also called Dr. Philippe Grandjean, a physician and
25
26
27
28

1 environmental epidemiologist at Harvard School of Public Health, and Dr. Kathleen Thiessen, a risk
2 assessment scientist at Oak Ridge Center for Risk Analysis. [SOURCE: Hu Decl. ¶¶ 8-9, Lanphear Decl.
3 ¶¶ 9-10; Grandjean Decl. ¶ 1; Thiessen Decl. ¶ 1]

4 58. Abundant evidence exists in the record of EPA relying upon the expert judgment of
5 Plaintiffs' experts. The evidence shows that EPA:

- 6 A. Invited Plaintiffs' experts to serve on EPA Science Advisory Boards;
- 7 B. Based regulations to protect the public from the neurotoxic risks of lead and mercury
8 on research conducted by Plaintiffs' experts;
- 9 C. Awarded Plaintiffs' experts millions of dollars to investigate the impact of
10 environmental chemicals on human health;
- 11 D. Contracted with one of Plaintiffs' experts (i.e., Dr. Grandjean) to conduct a Benchmark
12 Dose analysis; and
- 13 E. Contracted with another Plaintiff expert (i.e., Dr. Thiessen) to write a health assessment
14 on fluoride compounds.
15

16 [SOURCE: Hu Decl. ¶¶ 7-9; Hu 6/8 Tr. 48:10-17; Lanphear Decl. ¶¶ 4-5, 7; Lanphear 6/10 Tr. 346:16-
17 347:20; Grandjean Decl. ¶¶ 5, 7-8, 11, 15; Grandjean 6/9 Tr. 146:19-21; Thiessen Decl. ¶ 5]
18

19 59. Each of Plaintiffs' four experts had studied the effects of fluoride on human health prior to
20 this litigation. [SOURCE: Hu Decl. ¶ 11, Lanphear Decl. ¶ 10; Grandjean Decl. ¶¶ 12-14; Thiessen Decl.
21 ¶ 5-6]

22 60. Plaintiffs also called as witnesses two scientists who currently work at the EPA: Dr. Joyce
23 Donohue, a senior scientist who specializes on fluoride issues at EPA's Office of Drinking Water, and Dr.
24 Kristina Thayer, the Director of the Chemical and Pollutant Assessment Division within EPA's Office of
25 Research and Development. [SOURCE: 2d Am Appendix C (*Donohue*) at 23:11-24:24; Thayer 6/10 Tr.
26 435:21-436:3]
27
28

1 61. During Plaintiffs' case-in-chief, Dr. Donohue testified that new epidemiological studies
2 available on fluoride neurotoxicity, including the NIH-funded studies, are "well conducted" and warrant a
3 reassessment of all existing safety standards on fluoride. [SOURCE: 2d Am Appendix C (Donohue) at
4 31:16-25, 32:4-6, 34:9-18, 36:5-17]

5 62. Dr. Thayer testified about her own assessment of the animal literature on fluoride
6 neurotoxicity, and offered that the animal studies support the biological plausibility of fluoride causing
7 neurotoxic effects in human beings. [SOURCE: Thayer 6/10 Tr. 450:9-13]

8 63. Dr. Tala Henry is the one EPA scientist who EPA called as an expert in its case. Unlike Drs.
9 Donohue and Thayer, however, Dr. Henry had not had any involvement on fluoride-related matters at the
10 Agency prior to this case, and conceded she was not an expert on fluoride.² [SOURCE: Henry 6/16 Tr.
11 961:14-962:5]

12 64. The two experts that EPA relied upon (Dr. Ellen Chang and Dr. Joyce Tsuji) to evaluate the
13 fluoride neurotoxicity literature work at the private consulting firm Exponent. [SOURCE: Chang 6/15 Tr.
14 848:5-6; Tsuji 6/15 at 696:9-12; *see also* Hu 6/8 Tr. 65:12-17 (discussing Exponent); Grandjean 6/9 Tr.
15 193:22-194:2 (same); Lanphear 6/10 Tr. 364:21-365:3 (same)]

16 65. By their own admissions, neither Dr. Chang nor Dr. Tsuji were experts on fluoride prior to
17 their retention. [SOURCE: Chang 6/15 Tr. 847:10-15, 847:23-848:4; Tsuji 6/15 at 696:5-8]

18
19
20 **F. Risk vs. Causation**

21 66. Neither Dr. Chang nor Dr. Tsuji conducted risk assessments in this case, nor did they
22 consider the *Guidelines*. [SOURCE: Chang 6/15 Tr. 874:1-9; Tsuji 6/15 Tr. 719:10-18, 720:9-11; 760:17-
23 22]

24 67. Instead, Dr. Chang and Dr. Tsuji conducted causal analyses to assess whether fluoridation
25

26
27 ² The EPA did call Dr. Thayer as a fact witness to explain the methodologies used in systematic
28 review. During EPA's examination of Dr. Thayer, counsel did not inquire about her own assessment of the
fluoride literature.

chemicals cause neurotoxicity at the level added to drinking water. [SOURCE: Henry 6/16 Tr. 985:1-987:2; Chang 6/15 Tr. 792:12-18, 797:22-798:13; Tsuji Decl. ¶ 17; Tsuji 6/15 Tr. 723:24-724:5]

68. Under TSCA, it is not necessary to prove causation in order to demonstrate an unreasonable risk. [SOURCE: Undisputed Fact No. 16; EPA Counsel 6/17 Tr. 1109:5-8]

69. EPA has never once used a causation standard in any of its risk evaluations under Section 6. [SOURCE: Henry 6/16 Tr. 987:6-8]

70. In using a causation standard to assess the evidence on fluoridation chemicals, EPA and its experts held Plaintiffs to a burden of proof that EPA has not used for any other chemical under Section 6. [SOURCE: Henry 6/16 Tr. 985:1-987:2, 987:16-18]

71. EPA uses risk assessment to determine the presence of risk under TSCA, which is a distinct analytical framework from causal analysis. [SOURCE: Undisputed Fact No. 14; Chang 6/15 Tr. 872:25-873:20]

72. The analytical framework that EPA uses for risk assessment was established in 1983 by the National Research Council (NRC). It is a framework with four steps: hazard identification, dose-response assessment, exposure assessment, and risk characterization. [SOURCE: Undisputed Fact No. 12]

73. In its 1983 report, the NRC called on federal regulatory agencies to establish “inference guidelines” in order to promote consistency and quality in the risk assessment process. [SOURCE: Pls’ Ex. 17 (*Guidelines*) at v].

74. In response to NRC’s 1983 recommendation, EPA established the *Guidelines for Neurotoxicity Risk Assessment*, which EPA has stated it “will follow” when “evaluating data on potential neurotoxicity associated with exposure to environmental toxicants.” [SOURCE: Pls’ Ex. 17 (*Guidelines*) at 1; see also Undisputed Fact No. 18]

75. EPA agrees that it is permissible to use the *Guidelines* to conduct the risk assessment component of a TSCA risk evaluation under TSCA. [SOURCE: Henry 6/16 Tr. 980:4-9; Henry Decl. ¶¶

82-83]

76. In addition to the four steps of risk assessment, an analysis of unreasonable risk under TSCA also involves a fifth and final step: the “risk determination.” Together, the “risk assessment” and “risk determination” constitute what EPA calls a “risk evaluation.” [SOURCE: Undisputed Fact Nos. 13-14]

III. HAZARD IDENTIFICATION

77. The focus of the *hazard* inquiry is whether the chemical may cause a neurotoxic effect(s) at some level of exposure. The question of whether this effect(s) is a *risk* at environmentally relevant exposures is a separate question that is addressed later as part of the Risk Characterization. [SOURCE: Thayer 6/10 Tr. 445:8-11; Thiessen Decl. ¶ 42]

78. Under the *Guidelines*, hazard assessment is a qualitative determination in which the risk assessor must determine whether “sufficient evidence” of a neurotoxicity hazard exists. A “sufficient evidence” finding “can be based on either human or animal data,” but EPA has a preference for using human data if suitable data exist. [SOURCE: Thiessen Decl. ¶ 43]

A. Human Studies

1. EPA’s “Sufficient Evidence” Standard for Human Studies

79. Under the *Guidelines*, “sufficient evidence” of a neurotoxic hazard exists if human studies show that “some neurotoxic effect is *associated* with exposure.” The *Guidelines* contrast this requirement of an “association” with what the Agency recognizes to be the “more stringent requirement” of “causality.” Under the *Guidelines*, there is no requirement to prove causality; evidence of a credible association is enough. [SOURCE: Thiessen Decl. ¶ 44; Pls’ Ex. 17 (*Guidelines*) at 53]

80. In assessing whether human studies demonstrate a neurotoxic hazard, the *Guidelines* state that prospective cohort studies “should weigh heavily” in the assessment. The *Guidelines* recognize that prospective studies are “invaluable for determining the time course for development of dysfunction” and permit a “direct estimate of risks attributed to a particular exposure.” [SOURCE: Thiessen Decl. ¶ 45; Pls’ Ex. 17 (*Guidelines*) at 17-18]

81. The emphasis on prospective cohort studies in the *Guidelines* is consistent with the prevailing consensus in the environmental health field. Under this prevailing consensus, the developmental health effects of environmental toxicants, including neurotoxicity, are best examined in long-term

prospective studies of birth cohorts with measurements of *prenatal* exposures. [SOURCE: Grandjean 6/9 Tr. 148:25-149:21, 153:1-14; Grandjean Decl. ¶ 87; Hu Decl. ¶ 3; Lanphear Decl. ¶ 37]

82. Under the *Guidelines*, sufficient evidence of a neurotoxic hazard can be demonstrated from a single “well-conducted study.” [SOURCE: Pls’ Ex. (*Guidelines*) at 55]

2. Cross-Sectional Studies in Endemic Fluorosis Areas

83. In contrast to the chemicals that EPA has previously analyzed under the *Guidelines*,³ there are a large number of human studies on fluoride neurotoxicity. [SOURCE: Thiessen Decl. ¶ 57; Grandjean 6/9 Tr. 319:14-320:5; Thayer 6/10 Tr. 458:17-19; Thayer 6/12 Tr. 640:15-641:4; Thiessen 6/10 Tr. 485:2-14; Chang 6/15 Tr. 799:3-4]

84. Most of the human studies on fluoride neurotoxicity have utilized cross-sectional study designs, and have examined the effects of fluoride on IQ at water concentrations (>1.5 mg/L) that exceed the level currently added to water in the United States (0.7 mg/L). [SOURCE: Undisputed Fact No. 9; Grandjean Decl. ¶ 77]

85. A cross-sectional study is one where the exposure and outcome are measured at the same point of time. Cross-sectional studies are generally limited in ascribing causality due to the inability to determine whether the exposure preceded the outcome. [SOURCE: Pls’ Ex. 17 (*Guidelines*) at 16]

86. The limitation on inferring causality from cross-sectional studies is lessened in some of the fluoride studies because there was a reasonable basis to infer that current exposures were a proxy for exposures that existed prior to the health outcome (i.e., stable populations with stable water fluoride levels). [SOURCE: Grandjean 6/9 Tr. 160:22-161:15; Chang 6/15 Tr. 799:14-19; Chang Decl. at 27:25-28:4; Thiessen Decl. ¶¶ 60 & 87]

³ EPA has found nine chemicals to pose a neurotoxic hazard under the *Guidelines*. Of these nine chemicals, only three had *any* human data, and among the three chemicals with human data, there were no prospective studies. EPA made its hazard determination for each of these nine chemicals on animal data. [SOURCE: Thiessen Decl. ¶ 52 & Table 1]

87. The overwhelming majority of the cross-sectional studies on fluoride and IQ have found significant adverse association. [SOURCE: Grandjean Decl. ¶¶ 67-68, 78, 80; Thiessen Decl. ¶ 60]

88. Of 27 studies that met the inclusion criteria of Dr. Grandjean's 2012 systematic review and meta-analysis, 26 of the studies reported an association between fluoride and reduced IQ (Choi 2012). The average difference in IQ between the high-fluoride and low-fluoride areas was 6.75 points. This is a large effect size that rivals the impact of even high levels of lead. [SOURCE: Grandjean Decl. ¶¶ 78 & 115; Lanphear Decl. at 12 n. 7; Grandjean 6/9 Tr. 157:24-158:4]

89. Meta-analyses by Tang (2008) and Duan (2018) have reported similar results as Choi (2012). [SOURCE: Grandjean Decl. ¶ 115; Thiessen Decl. ¶ 60]

90. While many of the cross-sectional studies on fluoride and IQ have used relatively simple study designs with minimal control for potential confounders, the association between fluoride and reduced IQ has been replicated in Chinese studies with more sophisticated designs which have more carefully controlled for potential confounders, including a study conducted by Dr. Grandjean. [SOURCE: 2d Am. Appendix C (*Donohue*) at 39:7-28; Grandjean Decl. ¶ 81]

91. Overall, the *consistency* and *magnitude* of the observed association between fluoride and reduced IQ in the cross-sectional studies adds confidence that the association is real and not an artifact of bias or chance. [SOURCE: Grandjean Decl. ¶ 110; Grandjean 6/9 Tr. 160:16-21; Thayer 6/10 Tr. 446:19-24; Thayer 6/12 Tr. 631:20-632:10; Chang 6/15 Tr. 809:7-12]

3. Prospective Studies in North America

92. The National Institutes of Health (NIH) has funded prospective studies of fluoride and neurodevelopment in two North American birth cohorts: the MIREC cohort in Canada and the ELEMENT cohort in Mexico City. To date, these birth cohorts have resulted in four published studies on fluoride and neurodevelopment (Bashash 2017, Bashash 2018, Green 2019, Till 2020). [SOURCE: Hu Decl. ¶¶ 10-11; Lanphear Decl. ¶ 10]

93. It is undisputed that the ELEMENT and MIREC studies are the most reliable and rigorous studies to date on fluoride neurotoxicity. [SOURCE: Undisputed Fact No. 10; Chang 6/15 Tr. 806:19-20 & 886:6-13; Grandjean 6/9 Tr. 201:25-202:15]

94. The NIH-funded studies have undergone extensive peer-review. Prior to conducting the studies, the methodologies were scrutinized and vetted by a committee of 15 to 25 experts at NIH. Later, after the data were collected and analyzed, the studies underwent extensive peer review by the esteemed scientific journals which published them, including *Environmental Health Perspectives* (Bashash 2017) and *JAMA Pediatrics* (Green 2019). The peer review process for these studies was among the most extensive that the senior investigators (Dr. Howard Hu and Dr. Bruce Lanphear) have experienced in their prolific research careers. [SOURCE: Hu 6/8 Tr. 48:22-49:23, 54:25-56:7; Lanphear 6/10 Tr. 352:2-353:22]

95. The NIH-funded studies have many important methodological strengths, including: (1) prospective cohort study designs; (2) individual measurements of fluoride exposure; (3) extensive control for other factors that may influence IQ; (4) blinded evaluations; (5) large sample sizes that permit robust statistical analysis; and (6) reliable neurobehavioral tests. It is undisputed that these are “well designed” and “well conducted” studies. [SOURCE: Hu Decl. ¶¶ 14-22; Lanphear Decl. ¶¶ 36-44 & 57-58; Chang 6/15 Tr. 807:1-7; 2d Am. Appendix C (*Donohue*) at 31:22-25]

96. The three NIH-funded studies that examined the impact of *prenatal* fluoride exposure have each found significant dose-response relationships between fluoride and adverse effects, including reduced IQ and increased ADHD symptoms (Bashash 2017, Bashash 2018, Green 2019). The effects sizes found in these studies were large and on par with the neurological effects of lead poisoning. [SOURCE: Hu Decl. ¶¶ 23 & 27; Lanphear Decl. ¶ 47; Hu 6/8 Tr. 58:5-23; Lanphear 6/10 Tr. 355:4-356:15]

97. In the ELEMENT study, each 0.5 mg/L of fluoride in the urine of the pregnant mothers was associated with a drop of 3.15 and 2.5 IQ points among children aged 4 and 6-12, respectively. The dose-response relationship was found to be linear for both age groups, although there was some indication of a

threshold at approximately 0.8 mg/L among the 6-12 year olds. [SOURCE: Hu Decl. ¶¶ 23-24; Hu 6/8 Tr. 56:15-57:14]

98. The MIREC study examined IQ at ages 3 to 4 using three separate metrics of prenatal fluoride exposure: (A) maternal urine, (B) maternal intake of fluoride from water and beverages, and (C) water fluoride concentration. Each of these three metrics of exposure was correlated with significant reductions in IQ among the offspring. For the urine metric, each 1-mg/L increase in fluoride was associated with a 4.49 lower IQ score (in boys, but not girls); for the intake metric, each 1-mg/day increase in fluoride intake was associated with a 3.66 lower IQ score (in boys and girls); and, for the water fluoride metric, each 1 mg/L increase in fluoride was associated with a 5.29 lower IQ score (in boys and girls). [SOURCE: Lanphear Decl. ¶ 46; Lanphear 6/10 Tr. 353:23-354:13]

99. As with the 4-year olds in the ELEMENT cohort, the dose-response relationship between fluoride and IQ among the 3-to-4 year olds in the MIREC cohort was found to be linear and without an apparent threshold. [SOURCE: Lanphear Decl. ¶ 46; Lanphear 6/10 Tr. 354:14-355:3]

100. The ELEMENT and MIREC studies on prenatal fluoride exposure are consistent with the findings of a smaller birth cohort study by Jiminez-Valdez (2017). The Jiminez-Valdez study examined a population living in an endemic fluorosis area of Mexico. As with the ELEMENT/MIREC studies, it found a significant association between maternal urinary fluoride level and cognitive deficits in the offspring (assessed at 3 to 15 months of age). [SOURCE: Grandjean Decl. ¶ 89]

101. In addition to assessing prenatal exposure, one of the MIREC studies examined the impact of *infant* fluoride exposure. This study found a large and significant effect of infant exposure to fluoridated water on non-verbal IQ, with each 0.5 mg/L increase in water fluoride level associated with 9.3 less non-verbal IQ points among formula-fed infants (Till 2020). The Till study also found a significant adverse association with Full-Scale IQ, but the statistical significance was lost upon removing several outliers. [SOURCE: Lanphear Decl. ¶¶ 59 & 62; Lanphear 6/10 Tr. 361:5-18]

4. Prospective Studies in New Zealand

102. Not all prospective cohort studies are created equal. Each must still be assessed for potential bias. [SOURCE: Thayer 6/10 Tr. 459:2-8]

103. Two published studies (Shannon 1986; Broadbent 2015), and an abstract (Spittle 1998), have reported results on the relationship between *residence* in a fluoridated community and neurotoxic outcomes in two cohorts from New Zealand.

104. The first of the New Zealand studies was published in 1986 by Shannon. In this study, exposure to fluoridated water in a cohort from Christchurch was measured by tallying the number of years a child resided in a fluoridated area during their first 7 years of life, with no distinctions made for the *timing* of exposure, no information on *prenatal* exposure, no *biomarkers* of exposure (e.g., urine fluoride), and no information on the *amount of water consumed* at any point in life. Under the study's residence-based metric of exposure, a child who is bottle-fed fluoridated water her *first year* of life would be treated the same as a child who lived her seventh year of life in a fluoridated area. Using this relatively crude assignment of exposure, the study failed to find a significant relationship between fluoridated water and behavioral problems. [SOURCE: Grandjean Decl. ¶ 91]

105. In 1998, data was presented in an abstract on the relationship between fluoride and IQ in the Christchurch cohort (Spittle 1998). As with the Shannon study, the abstract measured fluoride exposure solely by residence in a fluoridated community during the first seven years of life. No relationship between fluoridation and IQ was observed. [SOURCE: Grandjean Decl. ¶ 101]

106. A third paper from New Zealand presented results of an IQ analysis on a cohort from Dunedin that was established from births in 1972-1973 (Broadbent 2015). Children were recruited at age 3 years, and IQ tests were administered at ages 7, 9, 11 and 13 years, and again at age 38. As with the Shannon study, there was no information on *prenatal* exposure, no *biomarkers* of exposure (e.g., urine fluoride), and no information on the *amount of water consumed* at any point in life. The only information

on exposure to fluoridated water was the child's residence at *a single snapshot in time* at age 5 (or at age 3 if residential information was not available at age 5).⁴ Further, most of the children who lived in *non*-fluoridated areas received fluoride supplements, which eliminated much of the difference in postnatal fluoride exposure between the fluoridated and non-fluoridated groups. Under these conditions, the study found no association between residence in a fluoridated area at age 5 and IQ. [SOURCE: Grandjean Decl. ¶¶ 92 & 94; Chang Decl., Tbl. 2 at p. 114⁵]

107. It is undisputed that the New Zealand studies are weaker and less informative than the North American studies. [SOURCE: Grandjean Decl. ¶ 95; Grandjean 6/9 Tr. 167:25-168:7, 201:25-202:15; Chang 6/15 Tr. 886:18-25, 880:4-21]

[A comparison of the relative strengths and weaknesses of the North American and New Zealand studies is provided below. See infra ¶¶ 142-191.]

B. Animal Studies

1. EPA's "Sufficient Evidence" Standard for Animal Studies

108. Under the *Guidelines*, animal studies provide "sufficient evidence" of a neurotoxic hazard if they demonstrate a "potential neurotoxic hazard" in humans. The "minimum evidence" to meet this threshold is "a single appropriate, well-executed study in a single experimental animal species." If no individual study is sufficient by itself, "the total available data may support such a conclusion" including data on toxicokinetics and mechanisms of action. [SOURCE: Thiessen Decl. ¶ 46; Pls' Ex. 17 (*Guidelines*) at 53]

109. The *Guidelines* provide four default assumptions for interpreting animal data. First, EPA assumes that "an agent that produces detectable adverse neurotoxic effects in experimental animal studies

⁴ See Chang Decl., Tbl. 2 at p. 114 (describing the assessment of fluoridation status as limited to "residential address at age 5 y (or 3 y if unavailable)").

⁵ Throughout this document, the references to page numbers in Dr. Chang's Table 2 refer to the pagination of the ECF docket entry (ECF No. 200).

1 will pose a potential hazard to humans.” Second, EPA assumes that neuroanatomical, neurochemical, and
2 behavioral changes “are of concern.” Third, EPA assumes that “the neurotoxic effects seen in animal
3 studies may not always be the same as those produced in humans” due to “species-specific differences in
4 maturation of the nervous system, differences in timing of exposure, metabolism, or mechanisms of action.”
5 Fourth, EPA assumes that “humans are as sensitive as the most sensitive animal species tested.” These four
6 assumptions are “plausibly conservative,” meaning that “they are protective of public health and are also
7 well founded in scientific knowledge about the effects of concern.” [SOURCE: Thiessen Decl. ¶ 61; Pls’
8 Ex. 17 (*Guidelines*) at 6-7]

10 110. Neurotoxic endpoints in animal studies fall into several categories, including
11 neuroanatomical, neurochemical, and behavioral. [SOURCE: Thiessen Decl. ¶ 47]

12 111. Neuroanatomical endpoints include changes to the brain, including damage to brain cells,
13 that are detectable under a microscope (i.e., “histological”). The *Guidelines* consider neuroanatomical
14 changes to be “of concern.” [SOURCE: Thiessen Decl. ¶ 48]

15 112. Neurochemical effects include biochemical changes, such as alterations in neurotransmitter
16 function and enzyme inhibition. The *Guidelines* state that neurochemical changes “may be regarded as
17 adverse because of their known or presumed relation to neurophysiological and/or neurobehavioral
18 consequences.” [SOURCE: Thiessen Decl. ¶ 49]

19 113. Behavioral changes include alterations to motor activity, changes in sensory abilities or
20 motor coordination, and impairments in learning, memory, and attention. EPA has repeatedly based
21 reference doses on behavioral alterations documented in animals, including learning and memory
22 impairments. [SOURCE: Thiessen Decl. ¶ 50]

23 24 25 **2. Data that EPA Has Found Sufficient for Hazard Determination**

26 114. In its risk assessments under the *Guidelines* to date, EPA has based its hazard determinations
27 on animal data due to the absence of available human data for the chemicals it has assessed. [SOURCE:
28

Thiessen Decl. ¶ 52]

115. The animal studies which EPA has used to establish RfDs under the *Guidelines* have not been “perfect” studies. Some of the principal studies, for example, did not conform to EPA’s testing guidelines, and those studies that investigated effects from prenatal exposures did not always control for “litter effects,” a methodological deficiency that can skew the effect size in developmental studies. [SOURCE: Thiessen Decl. ¶ 53]

116. EPA has recognized that unanimity across studies is not a pre-requisite to a hazard determination. In one risk assessment, for example, 5 of the 16 available animal studies did not find a neurotoxic effect, and among the studies that did show an effect, inconsistencies existed in terms of the doses that produced the effects. Despite this, EPA found the animal data to be sufficient to conclude that the chemical posed a neurotoxic hazard. [SOURCE: Thiessen Decl. ¶ 54]

117. EPA has taken a similar approach to animal data in some of its draft risk evaluations under Section 6 of TSCA. In its NMP risk evaluation, EPA based its risk calculations on animal data linking NMP to reduced fertility, despite the fact that there were only six animal studies available, three of which found no effect. These contradictory findings were considered a source of uncertainty, but it did not stop EPA from using this animal data to assess risk of chronic exposure in humans. In fact, EPA made findings of unreasonable risk in humans based on this small body of contradictory animal data. [SOURCE: Thiessen Decl. ¶ 55; Pls’ Ex. 49 (*NMP Risk Evaluation*) at 173-174]

3. Neuroanatomical and Neurochemical Studies

118. It is undisputed that fluoride causes neuroanatomical and neurochemical effects in the brain of laboratory animals (i.e., effects *within* the brain), and that these studies represent a “substantial majority” of the animal studies on fluoride neurotoxicity. [SOURCE: Thiessen Decl. ¶¶ 62-66; 2d Am Appendix C (*Hannan*) at 15:22-19:26; Pls’ Ex. 13 (*NRC Report*) at 221-222; Tsuji 6/15 Tr. 741:22-742:1]

119. Based on the neuroanatomical and neurochemical studies, the National Research Council

(NRC) concluded in 2006 that “fluorides have the ability to interfere with the functions of the brain” by both “direct and indirect means.” [SOURCE: Thiessen Decl. ¶¶ 46 & 62; Grandjean Decl. ¶ 54; 2d Am Appendix C (*Donohue*) at 27:11-19; 2d Am Appendix C (*Hannan*) at 15:22-19:26; Pls’ Ex. 13 (*NRC Report*) at 221-222]

120. The CDC and an interdepartmental panel of federal agency experts have accepted NRC’s findings as an accurate summary of the hazard, including its findings on neurotoxicity. [SOURCE: 2d Am Appendix C (*Hannan*) at 16:2-14]

121. Subsequent to the NRC’s 2006 report, over 100 animal studies investigating fluoride’s neurotoxicity have been indexed in the National Library of Medicine’s online database (“PubMed”). Most of these animal studies have continued to focus on fluoride’s neuroanatomical and neurochemical effects, with the overwhelming majority finding effects. [SOURCE: Thiessen Decl. ¶¶ 64-65]

122. Most of the animal studies on fluoride neurotoxicity have used subchronic exposure scenarios, which would tend to understate the effect from lifetime exposure. Among the studies that have tested animals at multiple points in time, the effects have tended to worsen with time, with some effects not appearing at all until 3 to 6 months of chronic exposure. Since most of the studies on fluoride neurotoxicity have lasted no longer than 3 months, the available studies are likely not detecting the full spectrum of fluoride’s effects. [SOURCE: Thiessen Decl. ¶ 68]

4. Learning and Memory Studies

123. At the time of NRC’s 2006 review, few animal studies had examined the impact of fluoride on outward manifestations of neurotoxicity, including learning and memory deficits. The NRC thus called for more research to better understand the functional consequences of changes occurring within the brain. [SOURCE: Thiessen Decl. ¶ 37; Grandjean Decl. ¶ 54; Pls’ Ex. 13 (*NRC Report*) at 223]

124. Subsequent to the NRC’s recommendations, many animal studies have investigated the

1 effect of fluoride on learning and memory. [SOURCE: Thayer 6/12 Tr. 620:2-6; Thiessen Decl. ¶ 63-65;
2 Grandjean Decl. ¶ 57]

3 125. In 2016, the National Toxicology Program (NTP) published a systematic review of the
4 animal studies that have investigated fluoride's impact on outward signs of behavior, including learning
5 and memory. The NTP excluded from its review any study that focused on changes going on within the
6 brain, and, as such, limited its review to a relatively small subset of the overall animal literature on fluoride
7 neurotoxicity. [SOURCE: Thayer 6/10 Tr. 450:20-23; Thiessen Decl. ¶ 75]
8

9 126. Despite excluding most of the animal literature on fluoride neurotoxicity, and despite
10 finding a number of methodological limitations with the studies, the NTP concluded that the animal data
11 "suggests adverse effects on learning and memory in animal[s] exposed to fluoride." [SOURCE: EPA Ex.
12 553 at 0008]
13

14 127. The NTP had "moderate confidence" that fluoride impairs learning and memory in animals
15 exposed during adulthood. Dr. Thayer, one of the principal authors of NTP's review, explained that
16 moderate confidence is a descriptor that is typically used when there is a *hazard*, and that "it's reasonable
17 to conclude that fluoride damages the brain at some level of exposure." According to Dr. Thayer, the animal
18 data supports the biological plausibility of fluoride causing neurotoxic effects in humans, a subject
19 discussed further below. [SOURCE: Thayer 6/10 Tr. 449:18-25, 450:9-13; EPA Ex. 553 at 0008]
20

21 128. The NTP had a lesser degree of confidence that fluoride impairs learning and memory in
22 animals exposed during development. The primary reasons for this lower degree of confidence were that
23 there were much fewer developmental studies available, and the studies that were available had failed to
24 control for litter effects. Irregardless, the EPA recognizes that it is a "reasonable hypothesis" that if a
25 chemical can impair learning during adulthood, it can also impair learning if the exposure occurs during
26 the more sensitive fetal period. [SOURCE: Thayer 6/10 Tr. 452:9-13, 453:10-454:1]
27
28

1 129. Subsequent to the NTP's review, 11 additional studies have investigated the impact of
2 developmental fluoride exposures on learning and memory. All but one of these 11 studies found cognitive
3 deficits in the fluoride-treated groups, including two studies by Bartos (2018 & 2019) that controlled for
4 litter effects. [SOURCE: Thiessen Decl. ¶ 78]

5 130. The one developmental study published subsequent to the NTP systematic review that failed
6 to find effects on learning or memory from fluoride exposure is McPherson (2018). [SOURCE: Thiessen
7 Decl. ¶ 78]
8

9 131. McPherson (2018) is a study conducted by scientists at the NTP. Although it did not find an
10 effect on learning and memory, it did find several changes in the fluoride-treated rats, including an increase
11 in pain sensitivity and an increase in swimming speed. The increase in swimming speed was apparent by
12 the fact that the fluoride-treated rats swam the same distance to get to the target (which indicates no
13 difference in learning/memory), but got to the target more quickly (which could indicate a potential effect
14 on motor function). [SOURCE: Thiessen Decl. ¶ 79; Tsuji Decl. ¶ 94; Tsuji 6/15 Tr. 752:18-753:9, 755:13-
15 16, 758:8-18]
16

17 132. McPherson (2018) is a well-conducted animal study, but it has its limitations. First, unlike
18 the overwhelming majority of previous studies on fluoride neurotoxicity, the McPherson study used Long
19 Evans Hooded rats. OECD testing guidelines recognize that different strains of rats may have different
20 performance attributes, and there is some evidence to indicate that this may be the case with Long Evans
21 rats and fluoride. The two studies prior to McPherson that had examined the impact of fluoride on *cognitive*
22 *outcomes*⁶ in Long Evans rats both found no effects. [SOURCE: Thiessen Decl. ¶ 80; Thiessen 6/12 Tr.
23 541:18-542:6]
24
25

26
27 ⁶ As noted in Dr. Thiessen's declaration, these two learning studies are Elliot 1967 and Varner 1994.
28 Other studies, however, have found neuroanatomical and neurochemical effects in Long Evans Hooded rats following fluoride exposure. [SOURCE: Thiessen Decl. at p. 26 n. 80; Thiessen 6/15 Tr. at 542:7-9]

133. A second limitation with McPherson is that, unlike most other developmental studies on fluoride, it did not begin exposure until day 6 of gestation. The offspring thus had no exposure to fluoride for roughly one-third of the 21-day *in utero* period, which may have limited the sensitivity of the study. According to OECD testing guidelines,⁷ starting exposure at day 6 is considered the “minimum” exposure period necessary for a developmental study. If there is no risk of pre-implantation loss, as is the case with fluoride, OECD guidelines provide that the exposure may begin at day 0 of gestation. [SOURCE: Thiessen Decl. ¶ 81; Tsuji 6/15 Tr. 766:13-767:14]

134. A third limitation with McPherson, which applies to all animal studies on fluoride neurotoxicity, is that the offspring had virtually no fluoride exposure during the neonatal period because the pups were breastfed during the pre-weaning period. This is important because the fluoride content of breast milk in rats (as with other mammals, including humans) is negligible, even when the mother is consuming large quantities of fluoride. The rats in the McPherson study thus had no exposure to fluoride during a “critical window of development” for neurodevelopment (early infancy). This is an important limitation given the widespread use of infant formula among human neonates. [SOURCE: Thayer 6/10 Tr. 442:12-16; Thiessen Decl. ¶ 82, 167-168, 174]

135. A fourth limitation with the McPherson study is that it tested relatively low levels of fluoride, a subject which is discussed further below in the dose-response section. See *infra* ¶¶ 305-308

136. According to EPA’s *Guidelines*, “To judge that an agent is unlikely to pose a hazard for neurotoxicity, the minimum evidence would include data from a host of endpoints that revealed no neurotoxic effects.” This evidence does not exist for fluoride. To the contrary, almost all animal studies, including McPherson et al. (2018), have reported adverse effects on at least one of the endpoints measured. [SOURCE: Thiessen Decl. ¶ 84; Pls’ Ex. 17 (*Guidelines*) at 55-56]

⁷ OECD testing guidelines represent the consensus views of 37 countries that “come together to try to find consensus on approaches to conducting testing, toxicity testing, and how to apply that in risk assessment.” [SOURCE: Henry 6/16 Tr. 932:9-13]

137. EPA has recognized that the McPherson study does not demonstrate or support the neurological safety of prenatal fluoride exposure. When asked to identify all primary studies that “demonstrate or support the neurological safety of prenatal fluoride,” EPA did not include the McPherson study.⁸ [SOURCE: 2d Am. Appendix C (EPA Interrogatory) at 1:22-28]

5. Bodyweight Changes Cannot Explain the Observed Effects

138. In some instances, neurotoxic effects observed in animal studies can be an indirect result of systemic toxicity, which is generally reflected by bodyweight reductions in the animals. [SOURCE: Thayer 6/10 Tr. 455:18-456:10]

139. When signs of neurotoxicity are only apparent in animals with “large decreases in body weight” (i.e., decreases in excess of 20%), EPA’s *Guidelines* consider the evidence to be “less persuasive” of a “direct neurotoxic effect.” [SOURCE: Thiessen Decl. ¶ 69]

140. While some of the animal studies on fluoride do show some body weight reductions, many do not—particularly at the lowest doses causing the effects. For example, six of the recent studies investigating prenatal exposures measured body weight in the animals, and only one of these studies found any body weight reductions. Moreover, the one study that found bodyweight changes did not observe any changes in the low-dose group in which neurotoxic effects were observed. [SOURCE: Thiessen Decl. ¶¶ 69 & 121; Tsuji Decl. ¶ 45]

141. Systemic toxicity, as reflected by bodyweight reductions, may confound some results in specific studies, but cannot explain the neurotoxic effects observed in the literature as a whole. [SOURCE: Thiessen Decl. ¶ 69; *see also* Thiessen 6/17 Tr. 1037:17-22 (discussing the Mullenix study)]

⁸ The only study that EPA identified is an animal study by Mullenix. However, even this study found neurotoxic effects, as EPA’s own expert conceded at trial. [SOURCE: Tsuji 6/15 Tr. 767:23-768:1; *see also* Lanphear 6/10 Tr. 396:5-19; Thiessen 6/17 Tr. 1037:17-22; Grandjean Decl. ¶ 53]

C. Strengths and Weaknesses of the Studies Identified by the Court (ECF No. 249)

In its July 2, 2020 order (ECF No. 249), the Court asked the parties to address the strengths and weaknesses of the following human studies: Barberio 2017, Bashash 2017, Bashash 2018, Broadbent 2015, Green 2019, Morgan 1998, Shannon 1986, Spittle 1998, Thomas 2018, and Till 2020. The Court also asked to address the strengths and weaknesses of the following animal studies: NTP 2016 and McPherson 2018.

1. Overall Summary

142. It is undisputed that the ELEMENT and MIREC studies (Bashash 2017, Bashash 2018, Green 2019, and Till 2020) are the most reliable human studies to date on fluoride neurotoxicity. [SOURCE: Undisputed Fact No. 10; Chang 6/15 Tr. 806:19-20 & 886:6-887:3; Grandjean Decl. ¶ 113]

143. It is undisputed that EPA has a preference for using human data instead of animal data when estimating risk in human populations. [SOURCE: Thiessen Decl. ¶ 43 & 114; Henry Decl. ¶¶ 124 & 125iv]

2. Study Design: Prospective vs. Cross-Sectional

144. It is undisputed that prospective cohort studies are, in general, stronger and more reliable than cross-sectional study designs. [SOURCE: Grandjean Decl. ¶ 87; Chang 6/15 Tr. 884:25-885:2]

145. Two of the 10 human studies on the Court's list used cross-sectional study designs: Barberio 2017 and Morgan 2018. Based on this, EPA's expert, Dr. Chang, gives these two studies less weight than the others. [SOURCE: Chang Decl. ¶¶ 192 & 194; Chang 6/15 Tr. 884:25-885:2; 887:1-3]

3. Individual Measurements of Exposure

146. It is undisputed that not all prospective studies are created equal and that those that have individual measurements of exposure are stronger and more reliable than those that do not have individual measurements of exposure. [SOURCE: Thayer 6/10 Tr. 459:2-8; Chang 6/15 Tr. 885:2-6; Grandjean Decl. ¶ 90]

147. Individual measures of exposure provide greater precision about each person's actual exposure to fluoride as compared to group-level measures. As noted by Dr. Chang, "group-level exposure

1 classification based on average drinking water fluoride levels in ecological studies does not capture
2 individual variation in drinking water intake or fluoride absorption and clearance.” [SOURCE: Chang Decl.
3 at 35:20-22]

4 148. Exposure imprecision is an important consideration when assessing epidemiological studies
5 because it tends to bias results towards the null and can thereby produce false negatives. [SOURCE:
6 Grandjean Decl. ¶ 28; Grandjean 6/9 196:21-197:15; Hu 6/8 Tr. 71:7-72:14; Lanphear 6/10 Tr. 370:11-19;
7 Pls’ Ex. 33A at 9-11]

8 149. Of the 8 prospective studies on the Court’s list, only the ELEMENT and MIREC studies
9 obtained individual measurements of exposure to fluoride (i.e., Bashash 2017, Bashash 2018, Thomas
10 2018, Green 2019, and Till 2020). [SOURCE: Hu Decl. ¶ 17; Lanphear Decl. ¶¶ 39 & 55; Chang 6/15 Tr.
11 807:3-7]

12 150. Each of the ELEMENT and MIREC studies used individualized biomarker data (i.e.,
13 maternal urine samples), while the MIREC studies also obtained individual information on the mother’s
14 ingestion of *tap* water, the mother’s ingestion of tea, and the child’s use of infant formula. This is an
15 important strength of these studies. [SOURCE: Hu Decl. ¶ 17; Lanphear Decl. ¶¶ 39 & 55; Chang 6/15 Tr.
16 807:3-7]

17 151. The only information that the New Zealand studies (i.e., Shannon 1986, Spittle 1998,
18 Broadbent 2015) had on a person’s exposure to fluoridated water was their home address (i.e., residence).
19 These studies had no individualized biomarkers (e.g., urine fluoride), no information on water intake, and
20 no information on bottled water vs. tap water consumption. This is an important weakness of the New
21 Zealand studies. [SOURCE: Grandjean ¶¶ 90-92, 95]

22 152. Of the three New Zealand studies, the Broadbent 2015 study had the crudest measure of
23 residence-based exposure to fluoridated water because it only considered the child’s residence at a single
24 moment in time (at age 5, or at age 3). [SOURCE: Chang Decl. Tbl. 2 (ECF No. 200) at p. 114; *see also*
25
26
27
28

Chang Decl. at 60:20-24]

153. The relatively crude and imprecise group-level measures of exposure used in the New Zealand studies would be expected to bias the results towards the null.

4. Timing of Exposure

154. It is uncontroverted that the *timing* of exposure is a crucial factor in neurotoxicity assessments because the fetal and neonatal brain has a heightened susceptibility to suffering harm.

[SOURCE: Grandjean 6/9 Tr. 150:15-22, 151:11-152:13; Thiessen Decl. ¶ 159]

155. Since timing is an important factor in determining whether a chemical produces a neurotoxic effect, a prospective study that has *prenatal* and *infant* measurements of exposure is superior to one that does not. [SOURCE: Grandjean ¶¶ 32, 87]

156. The ELEMENT and MIREC studies are the only studies on the Court’s list (ECF No. 249) that collected and analyzed prenatal exposures to fluoride, while the MIREC study is the only study to collect and analyze infant exposures to fluoride (Till 2020). This is an important strength of these studies.

[SOURCE: Grandjean Decl. ¶¶ 87 & 90; Chang 6/15 Tr. 803:3-7]

157. The New Zealand studies had no information on the timing of early-life exposure. [SOURCE: Grandjean Decl. ¶ 90; Chang Decl. at 60:17-24]

158. The Broadbent study had no information the subjects’ residential status prior to age 3. [SOURCE: Chang Decl. Tbl. 2 (ECF No. 200) at p. 114; Chang Decl. at 60:20-24]

159. In the Shannon and Spittle studies, residential information was assessed for the first seven years of life, but no distinction was made between early-life and school-age exposures. Thus, a child who was exposed to fluoridated water during the first year of life was treated the same as a child exposed during her seventh year of life. As Dr. Chang has recognized, the Shannon and Spittle studies “could not distinguish among potential windows of susceptibility.” [SOURCE: Grandjean Decl. ¶ 91; Chang Decl. at 60:17-20]

1 160. In light of these limitations, the EPA did not identify any of the New Zealand studies when
2 asked to identify all primary studies which “demonstrate or support the neurological safety of prenatal
3 fluoride exposure.” [SOURCE: 2d Am. Appendix C (EPA Interrogatory Response) at 1:22-28]

4 **5. Control for Potential Confounders**

5 161. It is undisputed that rigorously controlling for potential confounders improves the reliability
6 of a study. [SOURCE: Chang Decl. ¶¶ 117 & 171]

7 162. The Spittle study was only published as an abstract and makes no reference to controlling
8 for *any* potential confounding factors. The lead author of the study has stated that the abstract “provided
9 all important methodological details.” As such, the omission of any reference to confounder adjustment
10 suggests that no such adjustments were done. [SOURCE: Grandjean Decl. ¶ 101 & n.15]

11 163. EPA’s risk assessment scientist, Dr. Tala Henry, agreed at trial that it is not good scientific
12 practice to assume that an abstract controlled for potential confounders when the abstract makes no
13 reference of doing so. Accordingly, it would not be good scientific practice to assume that the Spittle
14 abstract controlled for any potential confounders. [SOURCE: Henry 6/16 Tr. 972:24-973:6]

15 164. Spittle’s failure to control for *any* potentially confounding factors is a glaring weakness. As
16 noted by Dr. Chang, studies that do not adjust for any confounders are “highly susceptible to bias from
17 numerous factors that can influence place of residence . . . and neurodevelopmental outcomes.” [SOURCE:
18 Chang Decl. ¶ 172]

19 165. The ELEMENT and MIREC studies did a much more thorough job controlling for potential
20 confounders than the New Zealand studies. [SOURCE: *Compare* Hu Decl. ¶ 15 *and* Lanphear Decl. ¶ 38
21 *with* Chang Decl. Tbl. 2 (ECF No. 200) at 114 (Broadbent) & 146 (Shannon)]

22 166. The ELEMENT and MIREC studies excluded individuals with conditions known to affect
23 neurodevelopment, including kidney disease, cardiovascular/circulatory disease, alcohol use, and drug use.
24 The Shannon and Broadbent studies made no reference to having any such exclusions. [SOURCE:
25
26
27
28

1 Compare Hu Decl. ¶ 15 and Lanphear Decl. ¶ 38 with Chang Decl. Tbl. 2 (ECF No. 200) at 114 & 146]

2 167. The ELEMENT and MIREC studies controlled for exposures to other neurotoxicants,
3 including lead, but the Shannon and Broadbent studies did not. This is a weakness of the New Zealand
4 studies because general population exposures to lead in New Zealand have been found to be associated
5 with IQ loss, including specifically in the Dunedin cohort, which increases the importance of controlling
6 for it. [SOURCE: Grandjean Decl. at p. 24 n. 9; Hu Decl. ¶ 15; Lanphear Decl. ¶ 38; Chang Decl. Tbl. 2
7 (ECF No. 200) at 114 & 146]

8 168. The ELMENT and MIREC studies controlled for maternal age, maternal education, and
9 Quality of the Home Environment (HOME), while the Bashash study also controlled for maternal IQ and
10 gestational age. The Broadbent study controlled for *none* of these factors, while the Shannon study only
11 controlled for maternal age and maternal education (as part of a single composite measure of “family social
12 position”). [SOURCE: Hu Decl. ¶ 15; Lanphear Decl. ¶ 38; Chang Decl. Tbl. 2 (ECF No. 200) at 114 &
13 146]

14 6. Full Studies Versus Abstracts

15 169. Two of the studies on the Court’s list of 12 studies are in abstract form only: Spittle 1998
16 and Thomas 2018. The Spittle abstract is an analysis of the Christchurch, New Zealand cohort, while the
17 Thomas 2018 abstract is an analysis of the ELEMENT cohort.

18 170. Although it is standard practice for systematic reviews to exclude abstracts, EPA’s expert,
19 Dr. Chang, relied on both the Spittle 1998 and Thomas 2018 abstracts in her review, and considered them
20 two of the most important 10 studies in her causal analysis. [SOURCE: Grandjean Decl. at p. 26:18-21;
21 Chang Decl. ¶ 182]

22 171. In her review, Dr. Chang “*assume[d]*” that the Spittle abstract adjusted for all of the same
23 confounders as in Shannon. This is not a good scientific practice. [SOURCE: Chang Decl. Tbl. 2 (ECF No.
24 200) at p. 148; Henry 6/16 Tr. 972:24-973:6]

172. In contrast to Spittle 1998, the Thomas 2018 abstract identified the potential confounders that it adjusted for and thus no assumptions were necessary to determine what the authors did. [SOURCE: Chang Decl. Tbl. 2 (ECF No. 200) at 148-149]

173. Plaintiffs' experts did not rely on any abstracts for their opinions in this case. While Dr. Hu cited the Thomas 2018 abstract (which he co-authored) in a footnote, he clarified that "I do not rely on these results here . . . since they have not yet been published in full." [SOURCE: Hu Decl. at p. 7 n.5 ; Grandjean Decl. at p. 26:16-21]

7. Further Details on Barberio 2017

174. As with the New Zealand studies, Barberio 2017 had no measurements of prenatal or infant exposure. Instead, the authors relied upon a single spot urine sample among children aged 3 to 12. The study thus provides little to no information about the impact of early-life fluoride exposures. [SOURCE: Chang Decl. Tbl. 2 (ECF No. 200) at p. 109; Grandjean Decl. at p. 31:2-3]

175. A more recent and sophisticated study (Riddell 2019) analyzed the same dataset that Barberio used (the Canadian Health Measures Survey, or CHMS) and found a significant association between fluoridated water and ADHD symptoms. [SOURCE: Grandjean Decl. ¶ 84]

176. The Riddell study looked at an older age group than Barberio (6-to-17 year olds vs. 3-to-12 year olds), which is appropriate given that 90% of children with ADHD are diagnosed after age 6. [SOURCE: Grandjean Decl. ¶¶ 83-84]

177. Whereas Barberio focused on parent- and self-reported "learning disabilities," Riddell focused on specific ADHD symptoms and diagnoses. [SOURCE: Grandjean Decl. ¶¶ 83-84]

178. The Riddell study adjusted for more potential confounders than Barberio, including lead. [SOURCE: Grandjean Decl. ¶¶ 84-85]

179. In addition to using current urine samples, the Riddell study analyzed the association between fluoridated water and ADHD symptoms/diagnoses among 710 children who were known to use

community water. [SOURCE: Grandjean Decl. ¶ 85]

180. As with the Barberio study, Riddell found a lack of association between current spot urine samples and ADHD symptoms/diagnoses. However, of 710 children who were known to drink community water, Riddell found a large, 6-fold higher odds of having an ADHD diagnosis among those living in fluoridated areas. [SOURCE: Grandjean Decl. ¶ 85]

181. Taken together, the Barberio and Riddell studies suggest that current spot urine samples among school-aged children is not a sensitive measurement of fluoride exposure for purposes of studying the relationship between fluoride and ADHD-related disorders. Barberio's reliance on current spot samples is therefore a major weakness.

8. Further Details on Morgan 1998

182. As with the other "no association" studies, the Morgan study did not attempt to assess the impact of fluoride exposures during the prenatal and infant stages of life. [SOURCE: Grandjean Decl. at 31:24]

183. An additional weakness of the Morgan study is that it did not control for *any* potential confounders. Although the study generically mentioned examining for "social and medical variables," it failed to provide any details on what these variables were, and how they were examined. [SOURCE: Chang Decl. Tbl. 2 at ECF No. 200 at p. 120]

184. In light of its limitations, the authors of the Morgan study recognized that no firm conclusions could be drawn from the results. [SOURCE: Grandjean Decl. at 20:22-26]

9. Animal Studies (NTP 2016 & McPherson 2018)

185. The NTP's 2016 review is a generally well-conducted systematic review of the literature. In contrast to the much more abbreviated review by Dr. Tsuji, the NTP report provides a clear, transparent, and structured assessment of study quality and bias.

186. The weaknesses of the NTP report are as follows:

1 187. By limiting its review to studies that investigate outward signs of behavior, the NTP report
2 limited its assessment to a relatively small subset of the animal studies on fluoride neurotoxicity.
3 [SOURCE: Thiessen Decl. ¶ 75]

4 188. The NTP report treats the water fluoride levels in rats as having a 1-to-1 equivalence with
5 water fluoride levels in humans, which is an unjustified assumption that is at odds with how EPA interprets
6 animal data. The NTP review's principal author, Dr. Thayer, concedes that assessing the equivalence of
7 animal doses to humans requires considerations of toxicokinetics and toxicodynamics, which the NTP
8 report did not do. [SOURCE: Thayer 6/10 Tr. 458:7-16; Thiessen Decl. ¶ 74, 138-140]
9

10 189. The NTP report divorced its findings on the adult studies from its assessment of the
11 developmental studies, but this makes little biological sense given the heightened vulnerability of the
12 developing brain. [SOURCE: Thayer 6/10 Tr. 440:18-441:1, 452:9-13]

13 190. The McPherson 2018 study has a number of important strengths, including (1) blinding of
14 examiners; (2) randomization of treatment groups; (3) control for litter effects; (4) a large battery of tests;
15 and (5) a relatively large number of animals.
16

17 191. The McPherson study also has some potentially important weaknesses, which are discussed
18 above. See *supra* ¶¶ 132-135.

19 **D. Biological Plausibility**

20 192. Under the *Guidelines*, consideration must be given as to whether an epidemiological
21 association between a chemical agent and a neurotoxic outcome "can be considered biologically plausible."
22 [SOURCE: Pls' Ex. 17 (*Guidelines*) at 53]
23

24 193. The epidemiological association between early-life (i.e., prenatal/neonatal) fluoride
25 exposure and reduced IQ is biologically plausible for the following ten reasons:

26 194. First, it is undisputed that fluoride crosses the placenta. The fluoride that a mother ingests
27 during pregnancy will thus have access to the fetus. [SOURCE: Undisputed Fact No. 30; Grandjean Decl.
28

¶ 48; Hu Decl. ¶ 25; Thiessen Decl. ¶ 93; Chang 6/15 Tr. 891:21-892:1]

195. Second, it is undisputed that fluoride gets into the fetal brain. [SOURCE: Undisputed Fact No. 30; Grandjean Decl. ¶ 51]

196. Third, it is undisputed that the blood brain barrier does not finish developing until six months *after* birth, and that the brain is more likely to be harmed by neurotoxicants when it does not have the protection of this barrier. [SOURCE: Undisputed Fact No. 29; Pls’ Ex. 19A (*EPA Toxicological Review*) at 58; Thiessen Decl. ¶ 94; Tsuji 6/15 Tr. 714:24-715:2]

197. Fourth, it is undisputed that the rapid and complex development of the brain during the *in utero* and infancy period makes it more vulnerable to the impact of neurotoxicants than the mature brain. [SOURCE: Grandjean Decl. ¶¶ 38-40; Thiessen Decl. ¶ 159; Grandjean 6/9 Tr. 150:15-22, 151:24-152:13; Lanphear 6/10 Tr. 349:5-8; Thayer 6/10 Tr. 440:18-441:1, 442:22-443:3]

198. Fifth, it is undisputed that fluoride interferes with the brain in laboratory animals. [SOURCE: Thiessen Decl. ¶ 62; Pls’ Ex. 13 (*NRC Report*) at 221-222; 2d Am Appendix C (*Hannan*) at 19:15-26; Thayer 6/10 Tr. 449:22-25; Chang 6/15 Tr. 893:8-24; Tsuji 6/15 Tr. 720:14-16]

199. Sixth, the principal author of the NTP systematic review, Dr. Thayer, agrees that the animal data supports the biological plausibility of fluoride causing neurotoxic effects in humans. [SOURCE: Thayer 6/10 Tr. 450:9-13]

200. Seventh, the NTP’s systematic review found moderate evidence that fluoride *impairs learning and memory* in adult animals, with moderate being a descriptor that NTP typically uses when there is a hazard. [SOURCE: Thayer 6/10 Tr. 449:18-20]

201. Eighth, due to the heightened vulnerability of the developing brain, EPA considers it a “reasonable hypothesis” that a chemical agent that impairs learning and memory during adulthood will also impair learning/memory if the exposure occurs during the more vulnerable prenatal period. [SOURCE:

Thayer 6/10 Tr. 452:9-13]

202. Ninth, while not definitive, direct modes of action have been identified that can explain fluoride's detrimental effects on cognition, including disturbances in hippocampal mitochondrial dynamics, signaling disruption, oxidative stress, selective reductions in nicotinic receptors, and impact on the dopamine system.⁹ [SOURCE: Thiessen Decl. ¶ 98; Hu Decl. ¶ 20]

203. Tenth, as discussed in greater detail below, fluoride has the capacity to lower thyroid function, particularly among individuals with low iodine intakes, and EPA has recognized that reductions in thyroid hormone levels during pregnancy can cause cognitive disorders and other neurological harm to the child. [SOURCE: Grandjean Decl. ¶ 55; Thiessen Decl. ¶ 89-92 & 163-64; Lanphear 6/10 Tr. 431:14-20; Thiessen 6/10 Tr. 482:4-483:24]

E. Impact on Thyroid Function

204. EPA's *Guidelines* recognize the relevance of a chemical's ability to alter the function of the thyroid gland. According to the *Guidelines*, "the development of the nervous system is intimately associated with the presence of circulating hormones such as thyroid hormone," and a thyroid disturbance during a specific developmental period may cause a "nervous system deficit, which could include cognitive dysfunction." Elsewhere, EPA has recognized that "thyroid hormones are essential for normal brain development in humans and that hypothyroidism during fetal and early neonatal life may have profound adverse effects on the developing brain." EPA has also recognized that "[t]he existence of a quantifiable relationship between thyroid hormone changes and neurodevelopmental outcomes has strong support from the literature," and, "[f]or populations with developing brains (e.g., fetuses, neonates, and children), disruptions in homeostatic thyroid function can result in adverse neurodevelopmental effects." [SOURCE: Thiessen Decl. ¶ 89; Pls' Ex. 17 (*Guidelines*) at 50; Pls' Ex. 18A (*Toxicological Review of BDE-47*) at 40;

⁹ EPA's *Guidelines* recognize that hazard identification is strengthened by, but not dependent upon, an identifiable mechanism by which the chemical can exert neurotoxic effects. [Thiessen Decl. ¶ 95]

Pls' Ex. 43A (*Perchlorate*) at 30527 & 30531]

205. In 2006, the NRC had enough information to conclude that fluoride is an “endocrine disrupter” which may lower thyroid function, particularly in individuals with iodine deficiency. The NRC estimated that fluoride can lower thyroid function at average intakes of 0.05-0.13 mg/kg/day in humans with adequate iodine intake, and at average intakes as low as 0.01 to 0.03 mg/kg/day in individuals with iodine deficiency. [SOURCE: Thiessen Decl. ¶ 90; Pls' Ex. 13 (*NRC Report*) at 262-263 & 266]

206. In light of the “decreasing iodine intake by the U.S. population,” the NRC called for research to examine fluoride’s “possible role in the development of several diseases and mental states in the United States.” According to national data from the CDC, more than 10% of women of child-bearing age in the US are iodine deficient. [SOURCE: Thiessen Decl. ¶¶ 90 & 163; Pls' Ex. 13 (*NRC Report*) at 267]

207. Subsequent to the NRC report, a nationwide study from the UK (Peckham 2015) reported that artificially fluoridated water is associated with a significant increase in the prevalence of hypothyroidism. Additionally, a study from Canada (Malin 2018) reported a significant relationship between urinary fluoride and elevated TSH (an indicator of decreased thyroid function) among iodine-deficient adults in Canada, but not in the general population as a whole. These epidemiological findings are consistent with and further support NRC’s findings. [SOURCE: Thiessen Decl. ¶ 91; Grandjean Decl. at p. 11 n. 2; Thiessen 6/10 Tr. 483:9-242]

208. Fluoride’s ability to disrupt the endocrine system, and its capacity to reduce thyroid function among adults with low-iodine intake, support the conclusion that neurotoxicity is a hazard of developmental fluoride exposure. [SOURCE: Thiessen 6/10 Tr. 482:4-483:24; Lanphear 6/10 Tr. 431:14-20]

F. Qualitative Dose Response

209. EPA’s *Guidelines* recognize that “determining a hazard often depends on whether a dose-response relationship is present,” and thus “dose-response evaluation is a critical part of the qualitative

1 characterization of a chemical’s potential to produce neurotoxicity.” Because “human studies covering a
2 range of exposures are rarely available,” the *Guidelines* state that the dose-response evaluation will
3 typically be limited to animal data. [SOURCE: Thiessen Decl. ¶ 85]

4 210. In contrast to the chemicals that EPA has evaluated under the *Guidelines*, there is dose-
5 response data for fluoride from *human* studies. The ELEMENT and MIREC birth cohort studies have each
6 found linear dose-response relationships between prenatal fluoride exposure and neurodevelopmental harm
7 in the offspring. The linearity of the dose-response relationships in these studies was not simply assumed—
8 it was scrutinized through appropriate statistical methods. [SOURCE: Thiessen Decl. ¶ 86; Hu Decl. ¶ 22;
9 Lanphear Decl. ¶ 43; Hu 6/8 Tr. 56:17-57:14, 73:14-74:3; Lanphear 6/10 Tr. 354:14-22]

11 211. In addition to dose-response data from human studies, there is also considerable dose-
12 response data from animal studies. A prerequisite for dose-response analysis in animal studies is that there
13 be multiple treatment groups with different exposures to the test substance. Thirty-four of the animal studies
14 indexed in the National Library of Medicine database since the NRC review have used multiple treatment
15 doses, and thereby permit evaluation of dose response. Of these 34 studies, 30 show visually apparent dose-
16 response trends for at least one of the effects being investigated. [SOURCE: Thiessen Decl. ¶ 88]

18 **G. Hazard Conclusion**

19 212. The large and substantial body of evidence that now exists for fluoride, from both animal
20 and human studies, satisfies EPA’s “sufficient evidence” standard for hazard determination.

21 213. EPA’s *Guidelines* provide that sufficient evidence of a hazard exists if epidemiological
22 studies show an *association* with a neurotoxic endpoint. The *Guidelines* further provide that prospective
23 cohort studies “should weigh heavily” in the assessment, and that “the minimum evidence sufficient would
24 be data on a single adverse endpoint from a well-conducted study.” [SOURCE: Thiessen Decl. ¶¶ 44-45;
25 Pls’ Ex. 17 (*Guidelines*) at 17-18, 53 & 55]

27 214. There is no dispute that the NIH-funded prospective studies of fluoride and
28

1 neurodevelopment are “well conducted” and “well designed” studies, and, indeed, the highest quality
2 studies on fluoride neurotoxicity to date. [SOURCE: Undisputed Fact No. 10; 2d Am. Appendix C
3 (*Donohue*) at 31:22-25; Chang 6/15 Tr. 807:1-7]

4 215. There is no dispute that each of the NIH-funded studies have found associations between
5 early-life fluoride exposure and detrimental neurodevelopmental effects, including reduced IQ and
6 symptoms of ADHD. [SOURCE: Hu Decl. ¶¶ 23 & 26; Lanphear Decl. ¶¶ 13-15]

7 216. Although the prospective studies from New Zealand did not find an association between
8 fluoride and neurotoxic endpoints, there is no dispute that these are weaker and less informative studies
9 than the North American cohorts because they did not consider or examine the effects of prenatal exposure,
10 and had no information about each individual’s actual exposure to fluoride from water. EPA thus accepts
11 that the New Zealand studies do not “demonstrate or support the neurological safety of prenatal fluoride
12 exposure.” [SOURCE: 2d Am. Appendix C (EPA Interrogatory Response) at 1:22-28]

13 217. By failing to assess the impact of prenatal fluoride exposure, and by using an imprecise
14 measure of exposure that likely biased the results towards the null, the New Zealand studies do not
15 materially contradict the findings of the ELEMENT and MIREC studies. [SOURCE: Grandjean Decl. ¶
16 113; Grandjean 6/9 Tr. 196:21-197:15, 201:23-202:15; Hu 6/8 Tr. 71:7-72:14; Lanphear 6/10 Tr. 370:11-
17 19; *see also* 2d Am. Appendix C (*Donohue*) at 42:13-3 (stating that there are no studies which rebut the
18 findings of the ELEMENT/MIREC studies)]

19 218. If the ELEMENT and MIREC studies are not sufficient, *by themselves*, to demonstrate a
20 hazard, EPA’s *Guidelines* permit consideration of the collective evidence if no study, by itself, is sufficient
21 to permit a hazard determination. [SOURCE: Thiessen Decl. ¶ 109]

22 219. Consideration of the collective evidence on fluoride further supports, rather than detracts,
23 from the determination of hazard, including: (A) cross-sectional studies consistently finding reductions in
24 IQ in communities with elevated fluoride exposure, *see supra* ¶¶ 83-91; (B) toxicokinetic data showing
25
26
27
28

1 that fluoride crosses the placenta and enters the fetal brain, see *supra* ¶¶ 194-196; (C) animal data showing
2 changes within the brain following fluoride exposure, see *supra* ¶¶ 118-121; (D) animal data showing that
3 fluoride impairs learning and memory, see *supra* ¶¶ 124-129; and (E) the NRC's conclusion that fluoride
4 can lower thyroid function, particularly among individuals with iodine deficiency, which includes over
5 10% of women of childbearing age. see *supra* ¶¶ 203-208.

6 220. Finally, to the extent that there is any doubt, EPA's own experts have agreed that fluoride
7 does damage the brain at some level of exposure – which is precisely what the hazard identification seeks
8 to determine.¹⁰ [SOURCE: Thayer 6/10 Tr. 445:8-11, 449:22-25; Tsuji 6/15 Tr. 720:14-16; Chang 6/15 Tr.
9 893:8-24; 6/17 Tr. (*EPA counsel*) at 1088:10-11]

18
19
20
21
22
23
24
25
26 ¹⁰ Consistent with this, Dr. Joyce Donohue, the chief scientist on fluoride at the Office of Water,
27 testified that she believes the available data on fluoride neurotoxicity are sufficient to warrant a dose-
28 response assessment. A dose response assessment is only done when a hazard is indicated. [SOURCE: 2d
Am. Appendix C (*Donohue*) at 40:6-12, 40:23-41:7; Thayer 6/12 Tr. 602:14-15; Henry Decl. ¶ 116]

IV. DOSE RESPONSE ASSESSMENT (HUMAN DATA)

A. Overview of the Process

221. If a chemical is identified as posing a neurotoxic hazard, EPA's *Guidelines* call for a quantitative dose-response analysis to determine the reference dose (RfD). The RfD is an estimate of the daily oral exposure to which the human population, including sensitive subgroups, can be exposed for a lifetime that's thought to be without risk of deleterious effects. [SOURCE: Thiessen Decl. ¶ 111; Thayer 6/12 Tr. 648:20-24]

222. In the quantitative dose response analysis, human or animal data are assessed to determine an appropriate "Point of Departure" (POD). The POD is the dose that serves as the starting point for extrapolating a reference dose. [SOURCE: Thiessen Decl. ¶ 112; Thayer 6/12 Tr. 649:15-20, 650:11-14]

223. The POD can be one of three types of values: the Benchmark Dose Level (BMDL), No Observed Adverse Effect Level (NOAEL), or Lowest Observed Adverse Effect Level (LOAEL). The EPA has a preference for using BMDL, but it still uses both the NOAEL and LOAEL approaches in its assessments. [SOURCE: Thiessen Decl. ¶ 112; Thayer 6/12 Tr. 650:18-24, 654:7-11, 654:24-655:4]

224. When human data are available, EPA's preference is to use human data for the POD. [SOURCE: Thiessen Decl. ¶ 114]

225. After a POD has been identified, EPA applies uncertainty factors to account for variability and uncertainty. These factors account for *intraspecies* (human-to-human) variability and *interspecies* (animal-to-human) variability. When applicable, these factors may also account for extrapolating from LOAELs to NOAELs, extrapolating from subchronic to chronic exposures, and deficiencies in the database of the chemical. [SOURCE: Thiessen Decl. ¶¶ 131-132; Thayer 6/12 Tr. 655:19-656:12]

B. Source of Data

226. EPA's *Guidelines* recognize that prospective cohort studies "permit direct estimates of risk attributed to a particular exposure." Consistent with this, EPA has conducted BMD analyses of prospective

1 birth cohort studies to establish the reference dose for other neurotoxicants, including methylmercury.
2 [SOURCE: Pls' Ex. 17 (*Guidelines*) at 17; Grandjean Decl. ¶ 127; Grandjean 6/9 Tr. 147:19-148:14]

3 227. It is undisputed that the NIH-funded ELEMENT and MIREC studies are the most reliable
4 studies yet conducted on fluoride neurotoxicity. EPA's retained epidemiologist, Dr. Ellen Chang, reached
5 this conclusion after conducting a formal systematic review of the literature. [SOURCE: Undisputed Fact
6 No. 10; Chang 6/15 Tr. 806:19-20, 886:6-13]

7 228. Use of the ELEMENT and MIREC studies to determine the BMDL is consistent with the
8 risk assessment that EPA's retained experts (Dr. Tsuji and Dr. Chang) conducted for arsenic. In their
9 analysis, Drs. Tsuji and Chang sought to determine if the existing RfD for arsenic is adequately protective
10 of neurotoxicity. To answer this question, they conducted a systematic review of the literature to see if
11 there were any studies that would permit a dose-response assessment for RfD-derivation purposes. They
12 found one study suitable for this purpose: a prospective study from Bangladesh by Hamadani. [SOURCE:
13 Grandjean Decl. ¶¶ 128-129; Tsuji 6/15 Tr. 727:9-14, 727:19-22, 731:1-4]

14 229. Dr. Tsuji found the Hamadani study to be of sufficient methodological quality to derive a
15 reference dose, and it is uncontroverted that the ELEMENT and MIREC studies are *at least* as suitable as
16 the Hamadani study for this purpose. [SOURCE: Grandjean ¶ 129; Tsuji 6/15 Tr. 731:1-4, 734:19-22]

17 230. As with the Hamadani study, the ELEMENT and MIREC studies have a (i) prospective
18 birth cohort design; (ii) large sample size; (iii) control for potential confounders; (iv) urine measurements
19 of the toxicant of interest during pregnancy; and (v) extended follow-up after birth. Further, the ELEMENT
20 and MIREC studies have an important advantage: the average arsenic exposure in Bangladesh substantially
21 exceeded exposures in the U.S., which is not the case with the North American fluoride cohort studies.
22 [SOURCE: Grandjean ¶ 129; Tsuji 6/15 Tr. 731:17-20, 734:23-735:2]

23 231. For the reasons stated, the ELEMENT and MIREC studies are appropriate studies to use for
24 the derivation of a BMDL.
25

27
28

C. Selection of the BMR

232. The benchmark dose (BMD) is defined as the dose that leads to a specific loss (or degree of abnormality) known as the benchmark response (BMR) in the outcome variable. The BMR must be defined before the analysis. [SOURCE: Grandjean ¶ 131]

233. According to EPA's BMD Dose Guidance, "[a] BMR of 1% has typically been used for quantal human data from epidemiology studies." [SOURCE: Pls' Ex. 43A (*Perchlorate*) at 30,536]

234. A 1% decrease in average IQ represents a loss of 1 IQ point because IQ scores are standardized to a mean of 100. [SOURCE: Hu Decl. ¶ 27]

235. Risk assessments of lead neurotoxicity have selected 1 IQ point as the BMR, and Dr. Tsuji selected 1 IQ point as the effect of concern in her arsenic assessment. [SOURCE: Grandjean ¶ 132; Tsuji 6/15 Tr. 735:18-25]

236. EPA has recognized that the loss of 1 IQ point has a detrimental effect on lifetime earnings. In its regulatory impact analyses, EPA has relied upon data showing that a 1-point increase in IQ is associated with an increase in lifetime earnings in the range of 1.76 to 2.38 percent. [SOURCE: Pls' Ex. 34 (*Lead Regulatory Impact Analysis*) at ES-10; Pls' Ex. 33 (*Mercury Regulatory Impact Analysis*) at 10-46]

237. Economists, including economists at the EPA, have estimated that the loss of 1 IQ point reduces lifetime earnings by an average of about \$18,000 in present value. [SOURCE: Hu Decl. ¶ 23; Grandjean Decl. ¶ 133; Pls' Ex. 43A (*Perchlorate*) at 30,552]

238. According to EPA's Clean Air Scientific Advisory Committee, a 1-to-2 IQ point reduction at the population level is "highly significant from a public health standpoint," and should be prevented in up to 99.5% of the population. [SOURCE: Lanphear 6/10 Tr. 362:8-364:3]

239. For the reasons stated, a loss of 1 IQ point is an appropriate BMR to use. EPA has offered no expert testimony to the contrary. [SOURCE: Henry 6/16 Tr. 1006:3-6]

D. Analyses of Data

1. ELEMENT Data

240. EPA recommends the use of linear dose-response models as the default model to use for benchmark dose analyses. [SOURCE: Grandjean 6/9 Tr. 252:24-25; 255:9-11]

241. It is reasonable to use a linear dose response model for the ELEMENT data because the authors of the ELEMENT study (Bashash 2017) did dose-response analyses and determined that the dose-response relationship is linear. [SOURCE: Hu Decl. ¶ 22; Hu 6/8 Tr. 56:17-57:14, 73:14-74:3; Grandjean 6/9 Tr. 318:6-18]

242. With a linear dose-response model, the BMD can be calculated from the ELEMENT study by using the reported regression coefficient (i.e., *Beta* value). This is a relatively simple calculation. The ELEMENT study reported that, after adjusting for potentially confounding factors, each 0.5 mg/L increase in maternal urinary fluoride is associated with a reduction of 3.15 IQ points among 4-year-olds. With this information, the BMD for 1 lost IQ point can be calculated by simply dividing 0.5 mg/L by 3.15. The resulting BMD is 0.159 mg/L. [SOURCE: Grandjean Decl. ¶ 137 & Tbl. 2; Grandjean 6/9 Tr. 183:5-16; Hu Decl. ¶ 23]

243. EPA prefers using a BMDL instead of a BMD because the former is more protective of public health. [SOURCE: Thayer 6/12 at 651:19-652:4]

244. In contrast to a BMD, a BMDL takes into account statistical uncertainty by considering the lower-bound 95% confidence limit of the regression coefficient. Based on the 95% confidence limit reported in the ELEMENT study, the BMDL for 4-year-olds is **0.099 mg/L**. [SOURCE: Grandjean Decl. ¶¶ 34, 137 & Tbl. 2; Grandjean 6/9 Tr. 183:5-16]

245. In addition to calculating the BMDL from the reported regression coefficient, the underlying data for the 4-year-olds in the ELEMENT study was obtained and analyzed. This was done by extracting the data points from the dose-response figure in Bashash 2017 using the *WebPlotDigitizer* software. Of the

original 287 observations, the software provided 286 observations, which is probably due to two overlapping observations. Missing only a single point, calculations based on the scanned data should be fairly reliable. [SOURCE: Grandjean Decl. ¶ 138; Grandjean 6/9 Tr. 178:25-179:8, 180:15-25]

246. Analysis of the 286 extracted datapoints produce results that are in close agreement with the results calculated from the reported regression coefficient. Specifically, analysis of the extracted data using a linear dose-response model produces a BMD of 0.16 mg/L and a BMDL of **0.102**. [SOURCE: Grandjean Decl. ¶ 13; Grandjean 6/9 Tr. 242:11-21, 243:9-24]

247. To assess the robustness of these calculations, sensitivity analyses were conducted to determine if non-linear dose-response models provide a better fit for the data. Analyses were run using a logarithmic conversion of the exposure parameter, as well as a split linear dose-response curve. These analyses produced results that deviated only marginally from the linear dose-response model and did not provide a better fit for the data. The sensitivity analyses thus confirm the soundness of the linear dose-response model for the BMDL calculation. [SOURCE: Grandjean Decl. ¶ 140; Grandjean 6/9 Tr. 254:16-255:11; 255:25-257:11]

248. The BMDL for IQ loss among the 4-year-olds in the ELEMENT study is thus approximately 0.1 mg/L.

2. MIREC Data

249. As with the ELEMENT study, it is reasonable to use a linear dose response model for the MIREC data because the authors of the MIREC study (Green 2019) scrutinized the dose-response relationship and found it to be linear. [SOURCE: Lanphear Decl. ¶ 43; Lanphear 6/10 Tr. 354:14-22; Grandjean Decl. ¶ 141]

250. The reported regression coefficients in the MIREC study were used to calculate the BMD and BMDL in the same manner as described above—both for the maternal *urinary* fluoride data, as well as the maternal fluoride *intake* data. [SOURCE: Grandjean Decl. ¶ 141]

251. For maternal fluoride *intake*, the BMDL for IQ loss (in *both* sexes) is **0.15 mg/day**.
[SOURCE: Grandjean Decl. ¶ 143]

252. For maternal *urine*-fluoride, the BMDL for IQ loss in boys is **0.13 mg/L**, and for both sexes is **0.21 mg/L** [SOURCE: Grandjean Decl. ¶ 143]

253. It is appropriate to use the urine-fluoride BMDL for *boys* since this is the sex that showed an effect using this metric of exposure. It is standard practice in risk assessment to select the sex that shows an effect when deriving risk calculations. In Dr. Tsuji's risk assessment of arsenic neurotoxicity, for example, she used the dose-response data on girls to derive the RfD because the study on which she relied did not find an effect in boys. [SOURCE: Thiessen 6/12 Tr. 583:21-584:1; Grandjean Decl. ¶ 130; Grandjean 6/9 Tr. 264:1-13]

254. Analysis of the individual data from the MIREC study has not yet been completed as it is pending a data-sharing agreement with the authors pursuant to conditions imposed by Health Canada. [SOURCE: Grandjean 6/9 Tr. 179:15-180:2]

E. Point of Departure (BMDL)

255. Overall, the results derived from the ELEMENT and MIREC studies are similar and uncontroverted. In the ELEMENT study, the BMDL for maternal urine among ~4-year-olds is approximately **0.1 mg/L** (both sexes), while in the MIREC study, it is **0.13 mg/L** (boys) and **0.21 mg/L** (both sexes). Consistent with these maternal urinary excretion values, the BMDL for maternal fluoride intake in the MIREC study is **0.15 mg/day** (both sexes). [SOURCE: Grandjean Decl. ¶ 143]

256. While the precise number of these BMDL values await confirmation through analysis of the raw data by the study authors, any deviation from the aforementioned values is expected to be marginal and immaterial vis-à-vis human exposures in fluoridated areas, a subject that is discussed further below. [SOURCE: Grandjean 6/9 Tr. 177:8-25, 259:21-25, 265:6-9]

F. Uncertainty Factors (*None*)

257. Human exposure to fluoride in fluoridated areas substantially exceeds the BMDL for IQ loss. See *infra* ¶¶ 318-332. There is no practical need, therefore, to discuss what uncertainty factor should be applied because, *even without an any uncertainty factor*, a risk is clearly apparent. [SOURCE: Grandjean Decl. ¶ 145; Grandjean 6/9 Tr. 178:1-6]

V. SUPPLEMENTAL DOSE RESPONSE ASSESSMENT (ANIMAL DATA)

258. When available, the EPA prefers to use human data for the Point of Departure and resulting reference dose. Since prospective cohort studies are now available for fluoride, these are the most appropriate source to derive the risk estimates. This does not mean, however, that the animal data is without value. As the EPA has noted, “[i]t is informative to compare RfDs derived from animal studies with those derived from the epidemiological literature.” For example, in the case of methylmercury, the animal-based RfD supported the human-based RfD, and EPA cited this as a factor that increased its “confidence” in the assessment. [SOURCE: Thiessen Decl. ¶ 114; Pls’ Ex. 32 (*EPA’s Methylmercury Assessment*) at 17-19]

259. There are several considerations that support the use of animal data to derive risk calculations for fluoride. First, EPA has used impairment in learning and memory in rodents as the adverse effect upon which to base the RfD for other chemicals. Second, a substantial number of animal studies of fluoride neurotoxicity have used 2 or 3 treatment groups (in addition to control groups), and EPA has found this to be sufficient for identifying Points of Departure, including in animal studies with as few as 10 rats per group. [SOURCE: Thiessen Decl. ¶¶ 114 & 117]

A. Source of Data

260. Given that the Point of Departure from the human data is based on the IQ effects of prenatal fluoride exposures, it is appropriate to focus on animal studies that measured cognitive outcomes following prenatal exposures.

261. Subsequent to the NRC’s 2006 review, the National Library of Medicine has indexed 17 rodent studies that have investigated the impact of prenatal fluoride on learning and memory. All but 1 of these studies reported adverse effects in the fluoride-treated rodents. [SOURCE: Thiessen Decl. ¶¶ 30 & 118]

262. In order to focus the analysis on the studies best suited for risk calculations, the studies that only used one treatment dose, or failed to use any randomization procedures, were excluded, leaving 10

1 studies for consideration. Of these 10 included studies, most used 2 or 3 treatment groups with at least 10
2 rodents per group, which is consistent with several of the principal studies that EPA has used to establish
3 RfDs for neurotoxicants. [SOURCE: Thiessen Decl. ¶¶ 119-12]

4 263. Nine of the remaining 10 studies found dose response trends for one or more effects, which
5 adds confidence to a causative role of the fluoride treatment. [SOURCE: Thiessen Decl. ¶¶ 121; Thayer
6 6/12 Tr. 631:20-23 & 632:11-14]

7 264. Six of the 10 studies provide data on the body weights of the pups, and *no* bodyweight
8 changes were seen in any of the studies at the lowest concentrations producing the effects. Only one of the
9 six studies found *any* bodyweight changes among pups in the *higher-dose* groups. Further, the two studies
10 that reported maternal weight did not find any changes. [SOURCE: Thiessen Decl. ¶ 121]

11 265. The absence of bodyweight changes in these studies adds confidence to their use for risk
12 calculations by ruling out the potential of systemic toxicity as an important contributing cause of the
13 neurotoxic effects. [SOURCE: Thiessen Decl. ¶¶ 69 & 121; Thayer 6/10 Tr. 457:10-19]

14 266. As with many of the animal studies on fluoride's cognitive effects, the 10 included studies
15 have methodological limitations that should be considered. [SOURCE: Thiessen Decl. ¶¶ 122 & 203]

16 267. One limitation is that only three of the studies specifically mention controlling for litter
17 effects, which introduces some uncertainty because the failure to control for litter effects can result in false
18 positives (as well as false negatives). Although a source of uncertainty, the failure to control for litter effects
19 does not preclude use for risk assessment purposes. As noted earlier, EPA has used studies that do not
20 control for litter effects as the principal studies upon which it has based RfDs for developmental
21 neurotoxicity. [SOURCE: Thiessen Decl. ¶¶ 122 & 124]

22 268. Other limitations with the studies include: lack of blinding, incomplete randomization, lack
23 of exposure during a critical window of development (infancy), lack of long-term chronic exposures, and
24 failure to rule out a contributing role of motor and sensory effects. [SOURCE: Thiessen Decl. ¶ 203;

Thiessen 6/12 Tr. 533:5-18]

269. The net effect of these limitations is uncertain. On one hand, lack of blinding and incomplete randomization can *inflate* the effect size, while on the other hand, lack of exposure during infancy and lack of chronic exposures can *deflate* it. Similarly, while lack of control for litter effects can create false positives, it can also create false negatives as well. [SOURCE: Thiessen Decl. ¶¶ 76 & 203]

270. Finally, to the extent that fluoride is causing learning/memory deficits indirectly through a motor/sensory mechanism, this would still be a neurotoxic effect and is thus not a basis to forego risk assessment. [SOURCE: Thiessen Decl. ¶¶ 77 & 203; Thayer 6/10 Tr. 452:21-24]

B. Dose Response Data from Prenatal Studies

271. **5 mg/L:** The lowest concentration tested in the 10 studies was 5 mg/L. Of the 6 studies that used this concentration, 3 found adverse effects on learning, and 2 of the 3 studies that did not find an effect on learning did find *alterations in the brain*. [SOURCE: Thiessen Decl. ¶ 124]

272. **11 mg/L:** Four of the prenatal studies used 10 or 11 mg/L for the low-dose group. Two of these four studies did not find effects on learning, although *all four of the studies found changes in the brain*. [SOURCE: Thiessen Decl. ¶ 127]

273. **20 mg/L:** The McPherson (2018) study is the one study that tested the effects of 20 mg/L. Although it found a neurotoxic effect at this concentration (i.e., increased pain sensitivity), it did not find an effect on learning/memory. [SOURCE: Thiessen Decl. ¶ 128]

274. **23 mg/L:** Seven of the 10 studies used 23 mg/L as a treatment dose, and *all 7 of these studies found impaired learning/memory*. [SOURCE: Thiessen Decl. ¶ 125]

275. **45 mg/L:** 45 mg/L is the highest dose used in any of the 10 studies. Of the 7 studies that used this dose, *all 7 found adverse effects on learning and memory*. In each of these 7 studies, adverse effects on learning were also found at lower levels (≤ 23 mg/L) so 45 mg/L represents the *highest* observed adverse effect level not the *lowest*. [SOURCE: Thiessen Decl. ¶ 126]

C. The Point of Departure (NOAEL)

1. The Principal Study – McPherson

276. To the extent that animal data are used for a neurotoxicity risk assessment on fluoride, EPA’s retained toxicologist, Dr. Joyce Tsuji, testified that the 20 mg/L NOAEL from the McPherson study would be an appropriate Point of Departure to use. [SOURCE: Tsuji 6/15 Tr. 750:15-19]

277. Although the McPherson study did not find an observed effect on learning/memory, it is uncontroverted that fluoride causes detrimental effects on learning/memory in rodents at higher concentrations, including at 45 mg/L.¹¹ [SOURCE: Tsuji 6/15 Tr. 746:24-747:7, 748:25-749:12]

278. Of all the potential Points of Departure to use from the prenatal animal data, the McPherson study would be the *least protective* (i.e., it will result in the highest reference dose). [SOURCE: Thiessen Decl. at 52, Tbl. 5]

279. The confidence in a risk determination is increased if human exposure exceeds even the least protective reference dose. Accordingly, since the primary interest in deriving risk estimates from the animal data is to assess the confidence to be given to the human data, it makes sense to focus on the least protective reference dose. [SOURCE: Thiessen Decl. ¶¶ 116 & 206]

2. Converting to the Human Equivalent Dose (HED)

280. Due to differences in toxicokinetics between rodents and humans, EPA does not use the animal dose as the Point of Departure. Instead, EPA calculates the “Human Equivalent Dose” (HED) and uses it as the Point of Departure (i.e., POD_{HED}).

281. EPA calculates the HED in one of three ways. [SOURCE: Thiessen Decl. ¶¶ 138-140]

282. EPA’s “optimal” approach for determining the HED is to use a physiologically based toxicokinetic model (PBTK). This approach is not available here because a PBTK model has not yet been

¹¹ EPA agrees that it is appropriate to consider the broader set of animal data when utilizing a NOAEL from any given study. [SOURCE: EPA Counsel 6/17 Tr. 1083:21-1084:3]

developed for fluoride. [SOURCE: Thiessen Decl. ¶¶ 138 & 142]

283. When a PBTK model is not available, EPA's preferred approach is to use chemical-specific information that, while falling short of a full PBTK model, provides some reliable guidance. Such information does exist for fluoride as studies indicate that rats require about 5 times more fluoride in their water than humans to achieve the same level of fluoride in their blood. The chemical-specific information on fluoride thus support adjusting the animal dose downwards by a factor of 5 to account for toxicokinetic differences. Applying this factor of 5 to the 20 mg/L NOAEL from McPherson produces a HED of 4 mg/L. [SOURCE: Thiessen Decl. ¶¶ 138 & 142; Tsuji 6/15 Tr. 761:15-25, 763:17-24]

284. When there is no reliable chemical-specific information on toxicokinetics, EPA uses an allometric scaling method (i.e., $BW^{3/4}$ Method) to ascertain the Human Equivalent Dose. Under EPA's allometric scaling method, the human dose is four times less (i.e., 24%) than the dose given to a rat. Using the allometric scaling method, results in a downward adjustment of the animal dose by a factor of 4, producing an HED of 5 mg/L, which is a slightly higher than the chemical-specific figure. [SOURCE: Thiessen Decl. ¶¶ 138-139]

285. The practical effect of using a 5 mg/L HED (derived from allometric scaling), instead of a 4 mg/L HED (derived from chemical-specific information) is that the resulting reference dose *will be higher, and less protective*. Although EPA prefers using chemical-specific information over default allometric scaling, the less protective 5 mg/L figure is used here in order to ensure higher confidence in the risk estimates derived from the animal data. [SOURCE: Thiessen Decl. ¶ 205]

286. Reference Doses are expressed in terms of dose (i.e., milligrams per kilogram of bodyweight, or mg/kg/day), not in terms of water concentration. Accordingly, the above analysis needs to be refined by converting the units into dose, which can be done by using data provided in the NTP's systematic review. [SOURCE: Thiessen Decl. ¶ 129]

287. According to NTP's data, the ratio of water fluoride concentration (mg/L) to dose

(mg/kg/day) for rats ranges from 6 to 10. If the lowest end of this ratio is used (=6) and applied to the 20 mg/L NOAEL from McPherson, the resulting animal dose is 3.3 mg/kg/day (i.e., 20 divided by 6 = 3.3). This then needs to be converted into the Human Equivalent Dose using the factor of 4 from the allometric scaling method, producing a Human Equivalent Point of Departure (POD_{HED}) of **0.79 mg/kg/day**. [SOURCE: Thiessen Decl. ¶ 130 & Table 5]

288. The practical effect of selecting the low-end of NTP's dose conversion range is that the calculated Point of Departure (0.79 mg/kg/day) likely *overestimates* the actual dose that the McPherson study used. This, in turn, will inflate the reference dose, making it even less protective of human health. [SOURCE: Thiessen Decl. ¶ 130]

D. Uncertainty Factors

1. Interspecies Variability

289. EPA recognizes that susceptibility to toxic substances differs across species. These *interspecies* differences are rooted in principles of both *toxicokinetics* and *toxicodynamics*. [SOURCE: Thiessen Decl. ¶ 137; Thayer 6/10 Tr. 457:21-25; Tsuji 6/15 Tr. 763:7-12]

290. *Toxicokinetics* governs how much of a chemical is absorbed into circulation and distributed to the target site, while *toxicodynamics* governs how much of the chemical at the target site is necessary to cause the adverse effect. [SOURCE: Thiessen Decl. ¶ 134; Tsuji 6/15 Tr. 762:20-763:4]

291. *Toxicokinetic Considerations for Fluoride*: Differences in toxicokinetics between animals and humans are accounted for by converting the animal dose into the Human Equivalent Dose using the methods explained above. Since the conversion to the HED is based on empirical data, EPA does not consider it an "uncertainty factor." [SOURCE: Thiessen Decl. ¶ ¶ 138-140]

292. *Toxicodynamic Considerations for Fluoride*: Since the HED primarily accounts for differences in toxicokinetics, the EPA uses a default uncertainty factor of 3 to account for differences in *toxicodynamics*, unless there is chemical-specific information to the contrary. [SOURCE: Thiessen Decl.

¶ 140; Tsuji 6/15 Tr. 763:13-16]

293. EPA has recognized that “given the longer period of brain development in humans, as compared to rodents, and the higher importance of cognitive function, it is appropriate to consider that humans may be more sensitive than rodents in the absence of specific data.” [SOURCE: Pls’ Ex. 17 (*Guidelines*) at 7; Pls’ Ex. 18A at 46]

294. In the case of fluoride, it is well recognized that humans are more susceptible to certain forms of fluoride toxicity than rodents. Rats, for example, have been reported to require 10 to 25 times more fluoride than humans to develop dental fluorosis. Consistent with this, the rats in the McPherson study that consumed 20 mg/L only had *mild* fluorosis, which is a condition that human infants can develop from consuming fluoridated water at just 0.7 mg/L.¹² [SOURCE: Thiessen Decl. ¶ 143; Tsuji 6/15 Tr. 760:25-761:16, 717:18-718:1]

295. Interspecies differences in *fluorosis* susceptibility support the existence of differential toxicodynamics between rodents and humans, but it is unclear if this difference would also apply to *neurotoxicity* because this has not yet been the subject of study. Conversely, there are no data to suggest that humans are *more resistant* to fluoride neurotoxicity than animals. [SOURCE: Thiessen Decl. ¶ 143]

296. In the absence of data indicating humans are more resistant to fluoride neurotoxicity, it is appropriate to use EPA’s default uncertainty factor of 3 to account for interspecies differences in toxicodynamic differences. [SOURCE: Thiessen Decl. ¶ 143]

2. ***Intraspecies Variability***

297. EPA recognizes that susceptibility to toxic substances varies across the human population (intraspecies variability), and that some subsets of the population will be more vulnerable to harm than

¹² As noted in a federal interagency report co-authored by scientists at the EPA, the national prevalence of dental fluorosis among adolescents was found to be approximately 41% in CDC’s 1999-2004 NHANES survey. [SOURCE: EPA Ex. 516 at 24938 (reporting fluorosis rates), 24939 (noting in the “Process” section that the report was authored by representatives of various federal agencies, including the EPA)]

1 others. [SOURCE: Thiessen Decl. ¶ 133]

2 298. If there are no chemical-specific data to quantify human-to-human variability, EPA uses a
3 default uncertainty factor of 10. This default factor of 10 is “considered to be appropriate in the absence of
4 convincing data to the contrary.” Consistent with this, EPA has used an uncertainty factor of 10 for
5 intraspecies variability in its draft risk evaluations under TSCA, as well as in its neurotoxicity risk
6 assessments under the *Guidelines*. [SOURCE: Thiessen Decl. ¶ 135; Pls’ Ex. 20A at 5-17; Pls’ Ex. 47 (*BP*
7 *Risk Evaluation*) at 192 & 248; Pls’ Ex. 49 (*NMP Risk Evaluation*) at 206]

8 299. In the case of fluoride, there is evidence that demonstrates substantial variability in how
9 humans respond, including differences in toxicokinetics (e.g., people with renal impairment have increased
10 accumulation of fluoride) and differences in toxicodynamics (e.g., people with iodine deficiency may suffer
11 harm at lower levels of exposure than those with adequate intake). [SOURCE: Undisputed Fact No. 6;
12 Thiessen Decl. ¶¶ 136, 163-164, & 181-190]

13 300. While the magnitude of human variability to fluoride is difficult to quantify, the data *support*
14 the *need* for an intraspecies uncertainty factor as opposed to providing “convincing data” *against* one. This
15 is particularly so since the Point of Departure is based on a study (McPherson) that did not examine rats
16 with conditions that would make them more susceptible to fluoride toxicity.¹³

17 301. EPA itself has used an uncertainty factor of 10 for intraspecies variability when assessing
18 animal data on *fluoride* toxicity for a pesticide registration. EPA has thus recognized the appropriateness
19 of using an intraspecies uncertainty factor of 10 for fluoride. [SOURCE: Thiessen Decl. ¶ 136; Pls’ Ex. 31
20 (*Sodium Fluoride Pesticide*) at 10-11; Thiessen 6/10 Tr. 500:8-14]

21 302. Finally, although the McPherson study investigated a susceptible life stage (prenatal), this
22
23
24
25

26 ¹³ As with the other 9 prenatal studies, the McPherson study did not investigate the effect of formula
27 feeding during the neonatal period, nor did it investigate the impact of co-existing iodine deficiency,
28 calcium deficiency, renal impairment, or potential genetic susceptibilities. [SOURCE: Thiessen Decl. ¶
210; Thiessen 6/10 Tr. 496:12-498:3]

1 does not affect the choice of an intraspecies uncertainty factor. As explained by Dr. Thayer, the presence
2 or absence of data derived from a developmental study is a consideration that EPA uses for selecting
3 whether to use an uncertainty factor for *database deficiency*, which is a separate and distinct uncertainty
4 factor. Consistent with this, EPA used an uncertainty factor of 10 for intraspecies variability in its Section
5 6 risk evaluation for NMP despite using a *developmental* health endpoint derived from an animal study
6 that specifically examined the *most vulnerable* life stage. [SOURCE: Thayer 6/12 Tr. 657:7-16; Henry
7 6/16 Tr. 995:10-996:5]

8
9 303. For the reasons stated, it is appropriate to use an uncertainty factor of 10 to account for
10 intraspecies variability to fluoride.

11 3. Composite Uncertainty Factor (=30)

12 304. The composite uncertainty factor is the product of all uncertainty factors. Here, an
13 uncertainty factor of 3 was used for interspecies variability (to account for differential toxicodynamics),
14 and an uncertainty factor of 10 was used for intraspecies variability. The composite uncertainty factor is
15 thus 30 (i.e., $3 \times 10 = 30$). [SOURCE: Thiessen Decl. ¶ 145]

16 D. Calculating the Reference Dose (=0.03 mg/kg/day)

17
18 305. The reference dose for fluoride can be calculated by applying the aforementioned
19 adjustments to the Point of Departure from the McPherson study (20 mg/L).

20 306. For purposes of simplicity, this will first be done by applying the adjustments directly to the
21 water fluoride concentration. To adjust for differences in toxicokinetics, the Human Equivalent Dose is
22 calculated by adjusting 20 mg/L downwards by a factor of 4 (per the allometric scaling method), which
23 produces a value of 5 mg/L. Next, to account for *interspecies* differences in *toxicodynamics*, the value is
24 adjusted downwards by an uncertainty factor of 3, which produces a value of 1.7 mg/L. Lastly, to account
25 for differences in *intraspecies* variability, the value is adjusted by an uncertainty factor of 10, which
26 produces a final safe water fluoride concentration of **0.17 mg/L**, which is below the concentration of
27
28

1 fluoride added to water for fluoridation (0.7 mg/L), and consistent with Dr. Grandjean's BMDL
2 calculations.

3 307. Since reference doses are expressed in terms of dose, the following calculations will be done
4 using units of mg/kg/day. To adjust for differences in toxicokinetics, the Human Equivalent Dose is
5 calculated by adjusting the (maximum-estimated) animal dose (3.3 mg/kg/day) by a factor of 4 (per the
6 allometric scaling method), which produces the Human Equivalent Dose of 0.79 mg/kg/day. Next, to
7 account for *interspecies* differences in *toxicodynamics*, the value is adjusted downwards by an uncertainty
8 factor of 3, which produces a value of 0.26 mg/kg/day. Lastly, to account for differences in *intraspecies*
9 variability, the value is adjusted by an uncertainty factor of 10, which produces a reference dose of 0.026
10 mg/kg/day. If this reference dose is rounded up to the next significant digit, it becomes **0.03 mg/kg/day**.
11

12 [SOURCE: Thiessen Decl. at p. 52 Table 5]

13 308. Despite being based on the *least protective* POD from the animal data, and despite using a
14 series of *non-protective adjustments*,¹⁴ the resulting 0.03 mg/kg/day reference dose for neurotoxicity is still
15 *lower* than EPA's current reference dose for severe dental fluorosis (0.08 mg/kg/day). [SOURCE:
16 Undisputed Fact No. 22]
17
18
19
20
21
22
23
24
25

26 ¹⁴ As discussed above, these non-protective assumptions include: (A) using the lowest end of NTP's
27 estimated water-to-dosage conversion, which likely results in a overestimate of the actual dose used in
28 McPherson; (B) using the allometric scaling method to calculate the HED when chemical-specific
information indicates the need for a larger adjustment; and (C) rounding up the reference dose from 0.026
to 0.03 mg/kg/day.

VI. EXPOSURE ASSESSMENT

A. Condition of Use: Water Fluoridation

309. The only condition of use at issue in this case is the addition of fluoridation chemicals to drinking water. [SOURCE: Undisputed Fact No. 2]

310. Approximately 200 million people in the United States drink water treated with fluoridation chemicals. [SOURCE: Undisputed Fact No. 1]

311. Fluoridation chemicals are added to drinking water to prevent tooth decay. In addition to being added to water, fluoride is added to dental products and certain pesticides. [SOURCE: Undisputed Fact No. 3]

312. Up until 2015, fluoridation chemicals were added to U.S. drinking water supplies at a concentration of up to 1.2 mg/L. Due to concerns that children are being overexposed to fluoride (as reflected by increasing rates of dental fluorosis in U.S. children), the CDC and other federal agencies recommended that the concentration of fluoride in water be reduced to 0.7 mg/L. This recommendation was finalized in 2015. [SOURCE: EPA Ex. 516 at 001]

313. Exposure to fluoridation chemicals is not limited to those who live in areas where water is fluoridated. Many commercial beverages and foods are made with fluoridated water, which results in elevated concentrations of fluoride in these products. [SOURCE: Grandjean Decl. ¶¶ 150 & 156; Thiessen Decl. ¶ 155; Pls' Ex. 41A at 3437; Pls' Ex. 53 (Lavelle Decl.) ¶ 15; Pls' Ex. 53 (Staudenmaier Decl.) at 13]

314. Fluoridated water is recognized as the largest source of fluoride exposure for adults, particularly when indirect sources are accounted for, including commercial beverages. [SOURCE: Grandjean Decl. ¶ 150; Lanphear Decl. ¶ 27]

B. External Exposure vs. Internal Dose

315. Exposure to a chemical agent can be expressed in terms of the *external* amount that the body

comes in contact with (e.g., the amount of a chemical that is ingested in water), or in terms of the amount that is *internally absorbed* into the body after contact (e.g., the amount of a chemical that is excreted in the urine). [SOURCE: Hu Decl. ¶ 38]

316. In terms of predicting toxic effects, the internalized dose of a chemical agent is more relevant than the external intake because it better reflects the concentration of the chemical that is available to the target site(s) in the body. [SOURCE: Hu Decl. ¶ 38; Lanphear 6/10 Tr. 423:1-18]

317. The ideal measurement of internal dose is the dose of the chemical agent at the target site(s) of concern (e.g., the brain). This information, however, is rarely available, and thus EPA risk assessments routinely rely on other exposure metrics as a proxy for the target site.¹⁵ [SOURCE: EPA Ex. 530 at 8-9]

318. Urine fluoride is currently considered the optimal biomarker of internalized fluoride exposure. While blood fluoride is also a biomarker, it has a higher degree of daily fluctuation than urine fluoride which produces greater exposure imprecision. [SOURCE: Lanphear 6/10 Tr. 350:16-20; Hu Decl. ¶ 38; Hu 6/10 Tr. 330:8-21]

C. Urinary Fluoride Levels in Fluoridated Areas

319. Urine fluoride has a close correlation with the fluoride concentration in water, which is consistent with the fact that fluoridated water is the largest source of fluoride exposure for most adults. [SOURCE: Grandjean Decl. ¶¶ 150-151; Lanphear Decl. ¶¶ 27 & 30-31]

320. The largest study of urine-fluoride levels in the United States was conducted in the 1940s and found that pooled urine samples from healthy young adults generally mirrored the fluoride concentration in the drinking water. Based on this early U.S. data, an adult drinking water with 0.7 mg/L fluoride was expected to have about 0.7 mg/L in their urine. [SOURCE: Grandjean Decl. ¶ 152]

¹⁵ See EPA Ex. 530 at 8-9 (“[M]ost risk assessments dealing with environmental chemicals . . . use dose-response relationships based on potential (administered) dose or internal dose, since the pharmacokinetics necessary to base relationships on [the amount transported to an individual organ, tissue, or fluid of interest] are *not available for most chemicals*.”).

321. There are no contemporary large-scale studies of urine-fluoride concentrations in the United States. The absence of such data owes in part to the fact that the CDC has not yet reported urinary fluoride levels as part of its ongoing National Health and Nutrition Examination Surveys (NHANES).¹⁶ [SOURCE: Grandjean Decl. ¶ 148; Grandjean 6/9 Tr. 189:23-190:5; 2d Am. Appendix C (Hannan) at 12:25-13:25]

322. The two most comprehensive studies of urinary fluoride during pregnancy were published by the ELEMENT team in 2016 and the MIREC team in 2018. [SOURCE: Hu Decl. ¶ 37; Lanphear Decl. ¶ 24]

323. In 2016, the ELEMENT team published what was, at the time, the largest characterization of urinary fluoride levels throughout pregnancy (Thomas 2016). The team examined a cohort of 515 women exposed to fluoridated *salt* in Mexico City.¹⁷ [SOURCE: Hu Decl. ¶¶ 37 & 42]

324. Fluoridated salt is designed to replicate the “optimal” levels of daily fluoride exposure provided by fluoridated *water* for purposes of caries prevention. [SOURCE: Hu Decl. ¶ 42; Hu 6/8 Tr. 119:12-25; Hu 6/10 Tr. 336:3-6]

325. In the ELEMENT cohort, the average *creatinine*-adjusted urinary fluoride level among the pregnant women in the ELEMENT cohort was **0.91 mg/L**. [SOURCE: Hu Decl. ¶ 40]

326. In 2018, the MIREC team published what remains the most comprehensive study of urinary fluoride during pregnancy (Till 2018). The MIREC study examined 1,566 pregnant women in Canada who had urine samples for each trimester of pregnancy. The study examined factors that may influence urinary fluoride levels, including fluoridated water, income, tea consumption, time of void, and time since last void. [SOURCE: Lanphear Decl. ¶ 25]

327. Of all the factors examined in the MIREC study, fluoridated water was found to have the

¹⁶ Although the CDC collected and tested urine for fluoride as part of its 2015-2016 NHANES survey, it has not yet released this data. [SOURCE: 2d Am Appendix C (Hannan) at 12:25-13:25; Grandjean Decl. ¶ 148]

¹⁷ The level of fluoride in the water of Mexico City is low (0.16 mg/L) and thus not a significant source of exposure for the cohort. [SOURCE: Hu Decl. ¶ 14:26-27]

largest influence on maternal urine-fluoride levels. The average urine-fluoride level in the fluoridated areas of the MIREC study was found to be **0.87 mg/L** (when adjusted for *creatinine*) and **0.71 mg/L** (when adjusted for *specific gravity*). [SOURCE: Lanphear Decl. ¶¶ 27 & 29]

328. The *creatinine*-adjusted fluoride levels in pregnant women drinking fluoridated water in Canada were “essentially the same” as the *creatinine*-adjusted fluoride levels in pregnant women consuming fluoridated salt in Mexico City (**0.87 vs. 0.91 mg/L**). [SOURCE: Lanphear Decl. ¶¶ 33-34]

329. A recent small-scale study of pregnant women in California found similar levels of urine fluoride among women living in fluoridated areas (Uyghurturk 2020). The study, which was conducted by researchers at the University of California San Francisco (UCSF), found that women who lived in fluoridated areas had average *specific gravity*-adjusted fluoride levels of **0.69 mg/L**, which is roughly the same (*specific gravity*-adjusted) level as pregnant women living in fluoridated areas of Canada (**0.71 mg/L**) [SOURCE: Grandjean Decl. ¶ 153]

330. The urine samples in the ELEMENT, MIREC, and Californian studies were all analyzed by Dr. Angeles Martinez-Mier at the University of Indiana University. Dr. Martinez Mier’s laboratory is considered the gold-standard lab for the testing of fluoride in biological samples, including urine. [SOURCE: Lanphear Decl. ¶ 26; Hu Decl. ¶ 39; Grandjean ¶ 153]

331. The small-scale nature of the UCSF study makes it less robust than the Canadian study,¹⁸ but the results of the Californian and Canadian studies are consistent in showing that *specific gravity*-adjusted urinary fluoride levels (**0.71 and 0.69 mg/L**) generally approximate the water fluoride levels in both Canada and the US. [SOURCE: Grandjean Decl. ¶ 153; Grandjean 6/9 Tr. 187:23-188:5]

332. Based on available data, pregnant women who consume fluoridated water will, on average,

¹⁸ All of the women in the study were tested while visiting a clinic in San Francisco, which is fluoridated. (Uyghurturk 2020). As the authors of the study note, this may have weakened the relationship between the mothers’ home water fluoride level and urine fluoride level (i.e., women from low-fluoride areas would have temporarily high urine fluoride levels, which would diminish the overall correlation between and home water and urine fluoride in the cohort). [SOURCE: Grandjean Decl. at p. 45 n. 27]

1 have (*specific gravity*-adjusted) urinary fluoride levels of approximately 0.7 mg/L, while the creatinine-
2 adjusted levels will generally be a bit higher.

3 333. Given TSCA's command to protect populations with "greater exposures" than the average
4 person (15 U.S.C. § 2602(12)), consideration must be given to pregnant women who consume higher-than-
5 average amounts of water. In its draft risk evaluations under Section 6, EPA has used 95th percentile
6 exposures (when such data is available) as the relevant high-end exposure. [SOURCE: Thiessen Decl. ¶
7 199; Thiessen 6/10 Tr. 494:7-15]

8 334. The UCSF study does not present data for 95th percentile urinary fluoride levels, but the
9 MIREC study does. Among women in the fluoridated areas of the MIREC cohort, the 95th percentile
10 urinary fluoride level in the second trimester was found to be **1.63 mg/L** (adjusted for *specific gravity*) and
11 **2 mg/L** (adjusted for *creatinine*). [SOURCE: Lanphear Decl. ¶ 32]

12 C. Blood Fluoride Levels in Fluoridated Areas

13 335. The concentration of fluoride in blood has a linear relationship to the concentration of
14 fluoride in the water. It has historically been estimated that adult populations consuming water with 1 mg/L
15 fluoride will have 1 micromole of fluoride per liter of blood (1 µmol/L = **0.019 mg/L**). [SOURCE:
16 Grandjean Decl. at p. 44 n. 26; Pls' Ex. 13 (NRC Report) at 21 & 442]

17 336. The level of fluoride in the blood of pregnant women was measured in both the UCSF study
18 and 2016 ELEMENT study. The UCSF study found that women in the fluoridated areas had an average
19 blood fluoride level of 1.1 µmol/L, which amounts to **0.021 mg/L**, which is essentially the same
20 concentration that the ELEMENT team found in the Mexico City cohort (**0.022 mg/L**). [SOURCE:
21 Grandjean Decl. at p. 44 n. 26; Hu Decl. ¶ 40]

22 337. The similarity in blood fluoride levels between women living in *water*-fluoridated areas of
23 California and *salt*-fluoridated Mexico City (**0.021 vs. 0.022 mg/L**) provides further evidence that the total
24 daily exposures to fluoride in these areas are materially the same.
25
26
27
28

D. Fluoride Intake from Fluoridated Water

338. Fluoride intake from fluoridated water is an external metric of fluoride exposure that is expressed in terms of milligrams per kilogram of bodyweight per day (mg/kg/day).

339. In the 1990s, the U.S. Department of Agriculture (USDA) conducted a national survey of water intake consumption in the United States. The USDA's survey was "designed to obtain a statistically representative sample of the United States population." [SOURCE: Thiessen ¶ 148]

340. In 2000, the EPA published an analysis of the USDA water intake data, and stated that the data "may be used in risk assessment analyses where exposures that occur through ingestion of water are of concern." [SOURCE: Thiessen ¶ 148]

341. In 2006, the National Research Council (NRC) published a comprehensive review of fluoride exposures in the United States. EPA recognizes that NRC reviews of chemical exposures are the types of materials that qualify as best available science. [SOURCE: Henry 6/16 Tr. 976:8-11, 977:3-6]

342. In its exposure assessment, the NRC used EPA's analysis of USDA's water intake data in order to estimate fluoride intake from fluoridated water. [SOURCE: Thiessen ¶ 148; Pls' Ex. 13 (NRC Report) at 430-433]

343. In 2019, EPA published a "comprehensive review" of water intake data. As part of this review, the EPA identified what the Agency believes to be "*the most up-to-date and scientifically sound*" data on water intake. [SOURCE: Thiessen Decl. ¶ 151; Henry 6/16 Tr. 978:15-23]

344. EPA's 2019 report on water intake was published as an update to the Agency's *Exposure Factors Handbook* ("*Handbook*"). The *Exposure Factors Handbook* is a document "intended for use by exposure and risk assessors both within and outside the U.S. EPA as a reference tool and primary source of exposure factor information." [SOURCE: Thiessen Decl. ¶ 150; Pls' Ex. 25 (*Exposure Factors Handbook – Introduction*) at 1-3]

345. Consistent with the purpose of the *Exposure Factors Handbook*, EPA's 2019 report

provides risk assessors with “recommended values” to use for water intake among each age group in the population. For each age group, EPA provides both the mean and 95th exposure. [SOURCE: Pls’ Ex. 26 (*EPA 2019 Report*) at 3-4]; *see also* Pls’ Ex. 13 (*NRC Report*) at 430 & 432]

346. As with EPA’s 2000 analysis of the USDA data, the EPA’s 2019 report does not specifically estimate *fluoride* exposure. Instead, it presents the data in terms of milliliters of *water* consumed per kilogram of bodyweight per day (mL/kg/day). However, because the concentration of fluoride in water is known (i.e., 0.7 micrograms per milliliter), fluoride ingestion can be directly estimated from EPA’s data.¹⁹ [SOURCE: Thiessen at p. 54 n. 197]

347. The data that EPA’s 2019 report identifies as the “most up-to-date and scientifically sound” data on water ingestion produces fluoride intake estimates from fluoridated water that are materially identical to the estimates provided by the NRC in 2006. Further, although the data does not include consumption of fluoridated water from indirect sources such as commercial beverages, both the NRC and EPA reports show that many people living in fluoridated areas will consume more fluoride from fluoridated water than the reference dose (0.03 mg/kg/day) derived from the McPherson study. [SOURCE: Thiessen ¶¶ 152-155 & 174]

348. According to EPA’s 2019 data, the *average* fluoride exposures among infants who consume fluoridated water during the first six months of life are **0.07 to 0.10 mg/kg/day**, while the 95th percentile exposures are **0.13 to 0.2 mg/kg/day** for the first 3 months and **0.13 mg/kg/day** for the next three months. These doses greatly exceed the reference dose from the McPherson study (0.03 mg/kg/day). [SOURCE: Thiessen Decl. ¶ 174]

349. While bottle-fed infants received the highest exposure to fluoridated water of all age groups in the population, EPA’s 2019 data shows that members *of all age groups* exceed the reference dose by

¹⁹ By way of example, if a person drinks 100 milliliters of fluoridated water per kilogram of bodyweight, they will receive a dose of 70 micrograms of fluoride per kilogram, which is more commonly expressed as 0.07 milligrams per kilogram (i.e., 0.07 mg/kg/day). [SOURCE: Thiessen at p. 54 n. 197]

1 drinking fluoridated water. Specifically, among the “all age groups” category, EPA’s data shows that the
2 95th percentile exposure is **0.031 mg/kg/day**. This means that over 5% of all people who consume
3 fluoridated water exceed the reference dose from the McPherson study, which is the *least protective*
4 reference dose that can be derived from the animal data on neurotoxicity.²⁰ [SOURCE: Thiessen Decl. ¶
5 154 & Figure; Thiessen 6/10 Tr. 489:19-22; Pls’ Ex. 13 (*NRC Report*) at 432]

26 ²⁰ The 95th percentile water intake among all age groups (water consumers) is 44 mL/kg/day. This
27 translates to a fluoride dose of 0.031 mg/kg/day and means that 5% of community water users living in
28 fluoridated areas consume at least 0.031 mg/kg/day of fluoride just from their water supply. [SOURCE:
Pls’ Ex. 26 (*EPA 2019 Report*) at 3-4; Thiessen Decl. ¶ 200]

VII. RISK CHARACTERIZATION

A. Definition of Risk

350. In EPA's risk assessments, including the Agency's draft risk evaluations under Section 6 of TSCA, a risk is deemed to exist if human exposure to a toxicant is *unacceptably close* to the exposure level that is estimated to cause the hazard. [SOURCE: Thiessen 6/10 Tr. 471:11-472:9]

351. Under EPA's definition of risk, it is not necessary to demonstrate that human exposure to a chemical under the condition(s) of use *causes* the hazard. [SOURCE: Undisputed Fact No. 16; Thiessen 6/10 Tr. 471:11-472:9; Henry 6/16 Tr. 987:6-8; EPA Counsel 6/17 Tr. 1109:5-8]

352. Under Section 6 of TSCA, EPA "generally uses" (but does not require) the Margin-of-Exposure (MOE) approach to characterize risk. [SOURCE: Undisputed Fact No. 25; Thiessen Decl. at p. 71 n. 281; EPA Ex. 544 (*Risk Evaluation Rule*) at 33735]

353. Under the MOE approach, the human exposure level under the condition of use is compared against the *Point of Departure*. The margin between these two points (i.e., "Actual MOE") is then compared against a "Benchmark MOE" (aka "Acceptable MOE") to determine whether human exposure is unacceptably close to the estimated hazard level. If the Actual MOE is less than the Benchmark MOE, the human exposure is considered unacceptably high and a risk is deemed to exist. [SOURCE: Undisputed Fact No. 25; Thiessen Decl. ¶ 193]

354. The Benchmark MOE is the composite uncertainty factor. The composite uncertainty factor thus determines the "acceptable" margin of exposure. [SOURCE: Undisputed Fact No. 25; Thiessen Decl. ¶ 193]

355. An example from EPA's draft risk evaluation of BP provides an illustration of how the MOE analysis works. Workers exposed to high levels of BP under one of the conditions of use had an Actual MOE of 63, which means the workers were exposed to 1/63rd of the Point of Departure from animal studies. EPA found this to present a risk because the Benchmark MOE was 100. In other words, human exposure

was considered *unacceptably close* to the hazard level because the Actual MOE (=63) was less than the Benchmark MOE (=100). [SOURCE: Thiessen 6/10 Tr. 472:11-475:8, 475:20-476:12; Pls' Ex. 47 (*BP Evaluation*) at 269]

356. In the BP risk evaluation, there was no human data demonstrating a hazard under the conditions of use. EPA thus extrapolated from animal data to infer the existence of a risk, and did so based on animal studies which used substantially higher levels of exposure than humans encounter under the condition of use. [SOURCE: Thiessen 6/10 Tr. 474:9-15]

B. BMDL for IQ Loss (Maternal Urinary Fluoride)

357. The BMDL for fluoride-induced IQ loss from prenatal fluoride exposure (as measured in maternal urine) is approximately **0.15 mg/L**. [SOURCE: Grandjean ¶ 143]

358. The *average* maternal urinary fluoride levels in pregnant women who drink fluoridated water in North America is approximately **0.7 mg/L** (adjusted for specific gravity), with *95th percentile* urinary fluoride levels exceeding **1.6 mg/L**. See *supra* ¶¶ 329, 331-334.

359. While some of the fluoride in the urine of pregnant women living in fluoridated areas comes from other sources of fluoride (e.g., dental products, pesticides, tea, etc.), the specific contribution of fluoridated water to the maternal urinary fluoride levels still exceeds the BMDL. This is evident by an examination of the average difference (=0.4 mg/L) in maternal urinary fluoride levels among women in fluoridated vs. non-fluoridated areas. Although this average difference understates the true contribution of fluoridated water,²¹ it is still two times greater than the BMDL. [SOURCE: Grandjean Decl. ¶ 156]

360. Finally, even if a threshold of 0.8 mg/L exists (as suggested among the 6-12 year olds in the ELEMENT study), the maternal urinary fluoride levels would still exceed the hazard level. As noted earlier, the 95th percentile urine-fluoride level exceeds **1.6 mg/L**, which is more than double the hypothetical

²¹ It understates the difference because the maternal urinary fluoride levels in the non-fluoridated areas are elevated, in part, due to the consumption of fluoridated water in commercial beverages and foods (i.e., the "halo effect"). [SOURCE: Grandjean Decl. ¶ 156]

threshold. [SOURCE: Hu Decl. ¶ 24; Lanphear Decl. ¶ 32; *see also* Grandjean Decl. ¶ 160 (reaching similar conclusion using 75th percentile values)]

361. As can be seen, maternal urinary fluoride levels in fluoridated areas substantially exceed the BMDL for fluoride-induced IQ loss. There is no need to do a formal Margin-of-Exposure analysis, therefore, because human exposure *exceeds the Point of Departure*. In other words, human exposure is *per se* “unacceptably close” to the hazard level because the exposure *exceeds the hazard level*.

C. BMDL for IQ Loss (Maternal Fluoride Intake)

362. The BMDL for fluoride-induced IQ loss from prenatal fluoride exposure (as measured from maternal fluoride *intake* from beverages) is approximately **0.15 mg/day**. [SOURCE: Grandjean ¶ 143]

363. The concentration of fluoride in fluoridated water is 0.7 mg/L, which means that a woman who drinks 1 liter of fluoridated water a day will consume 0.7 mg/day of fluoride, or approximately four times more fluoride than the BMDL.

364. According to EPA’s 2019 data on water intake, adults ingest an *average* of 0.011 to 0.013 mg/kg/day of fluoride from fluoridated water alone. For a woman who weighs 60 kg, this dose translates to an exposure of **0.66 to 0.78 mg/day**, which is approximately 4 to 5 times more than the BMDL. [SOURCE: Thiessen ¶ 152]

365. Adult intake of fluoride from fluoridated water exceeds the BMDL for maternal fluoride intake. There is no need to do a formal Margin-of-Exposure analysis, therefore, because human exposure *exceeds the Point of Departure*. Human exposure is thus *per se* “unacceptably close” to the hazard level because the exposure *exceeds the hazard level*.

D. NOAEL for Learning/Memory Deficits in Animals

366. To do a Margin of Exposure analysis with the animal data, the Actual MOE and Benchmark MOE need to be defined and compared against each other.

1. Benchmark MOE

367. The Benchmark MOE is the product of the uncertainty factors (aka “composite uncertainty factor”).

368. There are up to five uncertainty factors that EPA uses to derive the composite uncertainty factor. Here, only two uncertainty factors were used and the composite uncertainty factor is just 30, which EPA considers to be a relatively low value for risk assessments. [SOURCE: Thiessen Decl. ¶ 196]

369. Since the Benchmark MOE is defined by the composite uncertainty factor, the Benchmark MOE here is **30**. A risk will thus be found if the Actual MOE is less than 30 (i.e., if human exposure to fluoride from fluoridated water is within a factor of 30 of the Point of Departure).

2. Actual MOE

370. The Actual MOE is determined by dividing the Point of Departure (POD) by the Human Exposure. For illustration purposes, if the POD is 10 mg/kg/day and the human exposure is 1 mg/kg/day, the Actual MOE would equal 10 (i.e., 10 divided by 1 = 10).

371. *Point of Departure (POD)*: As discussed earlier, the Human Equivalent Dose of the McPherson study using EPA’s allometric scaling method and is **0.79 mg/kg/day**. See *supra* ¶¶ 287-288.

372. *Human Exposure Level*: For the Human Exposure level, the TSCA statute commands that EPA protect susceptible populations. In the case of fluoridation, this would require consideration of bottle-fed infants, as they have both intrinsic and extrinsic susceptibilities to fluoridated water. [SOURCE: Thiessen Decl. ¶¶ 165-167]

373. Typical Exposure for Bottle-Fed Infant: A typical exposure to fluoridated water among bottle-fed infants is 0.1 mg/kg/day. When the Point of Departure is divided by this dose, the Actual MOE is **7.9**, which is below the Benchmark MOE of 30. A risk thus exists for this population. [SOURCE: Thiessen Decl. at p. 74, tbl. 7; see also Thiessen Decl. ¶ 174]

374. High-End Exposure for Bottle-Fed Infant: A 95th percentile exposure to fluoridated water

among bottle-fed infants is at least 0.14 mg/kg/day. When the Point of Departure is divided by this dose, the Actual MOE is 5.6, which is well below the Benchmark MOE of 30. Even if the animal dose (3.3 mg/kg/day) is used for the POD, instead of the Human Equivalent Dose, the Actual MOE (23.6) is still less than the Benchmark. A risk thus exists for this population. [SOURCE: Thiessen Decl. ¶ 201]

375. High-End Exposure Among Adults: The 95th percentile exposure to fluoridated water among all adults is 0.031 mg/kg/day. When the Point of Departure is divided by this dose, the Actual MOE is 25.5, which is below the Benchmark MOE of 30. A risk thus exists for this population. [SOURCE: Thiessen Decl. ¶ 200]

3. RfD Analysis

376. Since the TSCA statute does not require the use of Margin of Exposure, other frameworks for assessing risk can be used, including the reference dose. [SOURCE: Thiessen Decl. at p. 71 n. 281]

377. As discussed earlier, human exposure to fluoride from fluoridated water exceeds the reference dose (0.03 mg/kg/day) from the McPherson study. A RfD analysis is thus consistent with the MOE analysis in showing a risk of concern from the consumption of fluoridated water. See *supra* ¶¶ 347-349.

VIII. RISK DETERMINATION

378. In the Risk Determination, EPA assesses whether the risks identified in the Risk Characterization are “unreasonable.” In making this determination, EPA generally considers “relevant risk-related factors,” including but not limited to: (i) the effects of the chemical substance on human health under the conditions of use; (ii) number of people exposed; (iii) whether susceptible subpopulations are exposed; (iv) the severity of the hazard; and (v) uncertainties. [SOURCE: Thiessen Decl. ¶ 212; Henry Decl. ¶ 180]

379. EPA also takes into consideration the Agency’s confidence in the data used in the risk estimate. [SOURCE: Henry Decl. ¶ 181]

380. In practice, EPA’s Risk Determination analyses have tended to be brief and written in summary form. [SOURCE: Thiessen Decl. ¶ 213; *see, e.g.*, Pls’ Ex. 47 (*BP Evaluation*) at 263-264 Pls’ Ex. 49 (*NMP Evaluation*) at 332-333]

A. Effects of Fluoridation Chemicals Under the Condition of Use

381. The effects of fluoridation chemicals under the condition of use are far better characterized than other chemicals that EPA has found to pose unreasonable risk under Section 6. [SOURCE: Thiessen Decl. ¶ 217]

382. In most of the risk evaluations that EPA has conducted thus far under Section 6, the Agency did not have actual human data on health effects associated with the condition of use. EPA had to rely, therefore, on animal data alone. [SOURCE: Thiessen Decl. ¶ 217]

383. In its risk evaluation of BP, for example, the EPA found unreasonable risks of acute developmental toxicity where human exposures were 63 times less than the Point of Departure in the animal studies, with zero corroborating human data under the condition of use. [SOURCE: Thiessen 6/10 Tr. 472:11-474:15]

384. In its risk evaluation of NMP, the EPA found unreasonable risks of reproductive toxicity

1 despite having no human data of reproductive toxicity in humans, and despite the human exposures being
2 up to 16 less than the Point of Departure from the animal data.²² [SOURCE: Thiessen Decl. ¶ 55; Pls' Ex.
3 49 (*NMP Risk Evaluation*) at 332]

4 385. In the case of fluoridation, there are four *prospective cohort studies* that have examined the
5 impact of “optimal” fluoride exposures, including two that examined the specific condition of use (water
6 fluoridation) at issue (Bashash 2017, Bashash 2018, Green 2019, Till 2020). Under EPA’s *Guidelines*,
7 prospective cohort data permit “*direct estimates of risks* attributed to a particular exposure.” [SOURCE:
8 Thiessen Decl. ¶ 217; Hu Decl. ¶ 42-43; Lanphear Decl. ¶ 14; Pls' Ex. 17 (*Guidelines*) at 17]

9 386. In addition to the prospective studies, there is a national cross-sectional study from Canada
10 that has found a significant association between water fluoridation and ADHD (Riddell 2019), and there
11 are many cross-sectional studies which have found significant associations between fluoride and reduced
12 IQ in endemic fluorosis areas with >1.5 mg/L (Choi 2012). For purposes of risk assessment, the margin
13 between a hazard level of 1.5 mg/L and an exposure level of 0.7 mg/L is not a health-protective margin.
14 The endemic fluorosis studies thus lend confidence to the findings of harm at 0.7 mg/L. [SOURCE: Decl.
15 ¶¶ 78, 84-86; Grandjean Tr. 160:16-21; Thiessen 6/10 Tr. 479:8-24]

16 387. In addition to the epidemiological studies that have directly investigated neurotoxic
17 outcomes, two large cross-sectional studies from Canada and the UK have examined the impact of
18 fluoridated water on thyroid function and have both found adverse associations. (Peckham 2015; Malin
19 2018). Alterations to thyroid function during pregnancy are well established to cause cognitive deficits,
20 and thus the association between fluoridation and thyroid toxicity provides mechanistic support for the
21 association with reduced IQ. [SOURCE: Grandjean Decl. ¶ 84-86; Thiessen Decl. ¶¶ 91-92]

22
23
24
25 ²² At trial, Plaintiffs’ counsel asked Dr. Henry about the Margin of Exposure estimates for one of
26 the conditions of use that was considered in the NMP risk evaluation. Counsel and the witness both made
27 a mistake regarding EPA’s risk determination regarding this condition of use. While EPA did find there to
28 be a risk (because the Actual MOE of 25 was less than the Benchmark MOE of 30), EPA concluded that
the risk was not unreasonable due to various uncertainties in the exposure modeling. [SOURCE: Henry
6/16 Tr. 991:24-992:25; Pls' Ex. 49 (*NMP Risk Evaluation*) at 312]

B. Generalizability of ELEMENT and MIREC Studies to the United States

388. In this litigation, attorneys for EPA have questioned the “generalizability” of the epidemiological findings from the ELEMENT and MIREC cohorts on the grounds that these cohorts are not based in the United States. At trial, no expert for EPA offered an opinion on this purported lack of generalizability.

1. EPA’s Use of Foreign Data to Assess Risk of Other Neurotoxicants

389. In practice, the EPA has relied upon epidemiological data from other countries to establish safety standards for neurotoxicants. For example, the EPA based its reference dose for mercury on a prospective cohort study from the Faroe Islands, and EPA relied, in part, on epidemiological data from the ELEMENT cohort in Mexico City to set its national air standard on lead. The EPA did not do an analysis on the “generalizability” of this foreign-based data. [SOURCE: Grandjean Decl. ¶ 7; Hu Decl. ¶ 9; Grandjean 6/9 Tr. 148:15-18; Hu 6/8 Tr. 54:2-10]

2. EPA’s Reliance on Foreign Data in this Case to Support *Absence* of Risk

390. Consistent with EPA’s practice with other neurotoxicants, EPA’s retained epidemiologist in this litigation, Dr. Ellen Chang, relied upon epidemiological data from Canada and New Zealand to support her opinion that fluoridation has not been established to cause neurodevelopmental harm (Barberio 2017, Broadbent 2015, Shannon 1986, Spittle 1998). In relying upon this foreign data, Dr. Chang did not conduct an analysis to demonstrate its “generalizability” to the US, other than referencing the general similarity in exposure conditions (i.e., “non-fluorosis-endemic western areas”). [SOURCE: Chang Decl. ¶ 182]

3. The View of the ELEMENT/MIREC Researchers

391. Prior to conducting the ELEMENT and MIREC studies, the principal investigators believed the results would be relevant to an assessment of water fluoridation in the US. Having now completed the studies, the authors maintain this view, and believe that the findings support the existence of a neurotoxic

1 risk from fluoridated water in the US. [SOURCE: Hu Decl. ¶¶ 13, 46; Lanphear Decl. ¶¶ 71-72; Hu 6/8 Tr.
2 74:22-75:1; Lanphear 6/10 Tr. 351:4-352:1]

3 4. The View of the National Institutes of Health

4 392. The ELEMENT and MIREC studies were both funded by the US-based National Institutes
5 of Health (NIH). Prior to approving any study that will be conducted in a foreign country, the NIH requires
6 that the researchers demonstrate the relevance of the study to the US population. The NIH's approval of
7 the ELEMENT and MIREC studies on fluoride and neurodevelopment demonstrates that the NIH agreed
8 with the researchers that the studies are relevant to the US. [SOURCE: Hu Decl. ¶ 50:11-52:1, 74:22-75:1]
9

10 5. Common Sense

11 393. The EPA routinely extrapolates toxicological findings from high doses in *animal studies* to
12 assess risk in human beings, including under TSCA. As a matter of common sense, extrapolating findings
13 from *human beings* who live in Canada to human beings who live in the United States involves less
14 uncertainty than extrapolating findings from *rodents*. [SOURCE: Thiessen Decl. ¶¶ 52, 55, 114; Thayer
15 6/10 Tr. 449:3-6; Henry 6/16 Tr. 989:2-17]
16

17 394. While genetics may influence the toxicity of certain chemicals, there is no identified basis
18 to suspect that human beings living in the United States are more biologically *resistant* to fluoride's
19 neurotoxic effects than human beings living in Canada. [SOURCE: Lanphear Decl. ¶ 71]

20 6. US Has Materially Similar Exposures as the ELEMENT/MIREC Cohorts

21 395. While the ELEMENT and MIREC studies did not attempt to determine how much fluoride
22 the subjects ingested from all sources combined, this information is not necessary to generalize the findings
23 to the United States. The internalized measures of exposure provided in these studies (e.g., maternal urinary
24 fluoride) are a dosimeter of total fluoride intake that provide a reliable, and indeed superior, basis for
25 relating the studies' findings to the United States. [Hu Decl. ¶¶ 38, 43-44; Hu 6/8 Tr. 75:14-16]
26

27 396. The average maternal urinary fluoride level among pregnant women in water-fluoridated
28

1 areas of the MIREC cohort are very similar to the maternal urinary fluoride levels among pregnant women
2 in the salt-fluoridated ELEMENT cohort [**0.87** (Canada) vs. **0.91 mg/L** (Mexico City) adjusted for
3 *creatinine*] and pregnant women in water-fluoridated areas of the United States [**0.71 mg/L** (Canada) vs.
4 **0.69 mg/L** (California) adjusted for *specific gravity*]. See *supra* ¶¶ 326 & 329.

5 397. Urine fluoride is considered a good indicator of total fluoride intake, and thus the similarity
6 in urinary fluoride levels in the three cohorts suggests that pregnant women in the three areas are receiving
7 similar daily intakes of fluoride. [SOURCE: Grandjean Decl. ¶ 151; Hu Decl. ¶ 43]

8 398. Blood fluoride is also considered a good indicator of total daily fluoride intake. The average
9 blood fluoride level among pregnant women in fluoridated areas of California are almost identical to the
10 blood fluoride levels of pregnant women in the ELEMENT cohort [**0.021 mg/L** (California) vs. **0.022 mg/L**
11 (Mexico City)]. See *supra* ¶¶ 334-335.

12 399. The similarity in internal fluoride levels between the Californian, Canadian, and Mexico
13 City cohorts is consistent with the reasonable expectation that communities that have water or salt²³
14 fluoridation programs will have similar exposures to fluoride,²⁴ as the purpose of these programs is to
15 produce “optimal” levels of fluoride ingestion for caries prevention in the population. Once the fluoride is
16 absorbed into the body, the source of the exposure (e.g., from salt or water) is immaterial with respect to
17 its toxic properties. [SOURCE: Hu Decl. ¶ 42; Hu 6/8 Tr. 119:12-25]

18 400. The fluoride exposures in fluoridated areas of the United States do not need to be *exactly*
19 the same as in the ELEMENT and MIREC cohorts for these studies to be generalizable and relevant to the
20 US. Rather, the exposures in fluoridated areas of the United States must be sufficiently high to present a
21 *risk* of the effects identified in these studies. [SOURCE: Grandjean Decl. ¶ 154]

22
23
24
25
26 ²³ Once fluoride is absorbed into the body, the source of the exposure (e.g., from salt or water) is
immaterial. [SOURCE: Hu Decl. ¶¶ 44-45; Hu 6/8 Tr. 75:12-13]

27 ²⁴ The United States and Canada add fluoride to water to reach the same target concentration (0.7
28 mg/L), although empirical data suggests Canadian cities only add approximately 0.6 mg/L, which is slightly
less than the U.S. [SOURCE: Grandjean Decl. ¶ 149; Lanphear Decl. ¶ 40]

401. Based on the BMDL analysis of the ELEMENT and MIREC data, prenatal fluoride exposure is associated with a loss of 1 IQ point when maternal urinary fluoride levels are approximately 0.15 mg/L. This is a level that will *clearly* be exceeded among adults consuming water with 0.7 mg/L, as evident not only by the California study, but by studies dating back to the 1940s which have found that the level of fluoride in urine typically mirrors the level of fluoride in the water. [SOURCE: Grandjean Decl. ¶ 154; Grandjean 6/9 Tr. 190:6-191:10]

C. Number of Peopled Exposed

402. The EPA has recognized that “the significance of the risk is dependent upon both the hazard (or toxicity) of the chemical substance and *the extent of exposure* to the substance.” In its Section 6 risk determinations, therefore, the number of people (usually workers) who are exposed to the chemical are identified under each condition of use. [SOURCE: Thiessen Decl. ¶ 218; EPA Counsel 6/17 Tr. 1105:1-6]

403. This factor weighs in favor of an unreasonable risk finding for fluoridation chemicals. The extent of human exposure to fluoridation chemicals is nothing short of massive, much like lead exposure was during the era of leaded gasoline. Today, approximately **200 million Americans**, or nearly 2/3 of the population, have municipal water to which fluoridation chemicals are added. Moreover, most of the remaining population living in “non-fluoridated” areas will routinely consume fluoridation chemicals in processed beverages and foods, as many beverages and foods are produced in fluoridated areas. To put these numbers in perspective, EPA has found unreasonable risks for conditions of use involving as few as 1,046 and 1,900 occupationally-exposed workers. [SOURCE: Thiessen Decl. ¶ 219; Undisputed Fact No. 1; Pls’ Ex. 47 (*BP Evaluation*) at 264; Pls’ Ex. 49 (*NMP Evaluation*) at 307, 311]

D. Exposure of Susceptible Subpopulations

404. EPA has recognized that an “important” aspect of expressing risk is describing “the nature of the exposed population and the potential for sensitive, highly susceptible, or highly exposed populations.” EPA has also recognized that, “[i]f the number of persons in the at-risk category can be

1 estimated, then the number of persons removed from the at-risk category after a contemplated action is
2 taken can be used as an indication of the efficacy of the action.” [SOURCE: Pls’ Ex. 17 (*Guidelines*) at 63-
3 64]

4 405. One of the consequences of widely dispersing a toxicant through the environment (versus
5 the use of industrial chemicals *within* manufacturing facilities) is that susceptible members of the general
6 public may be exposed. This is the case with fluoridation chemicals. [SOURCE: Thiessen Decl. ¶ 220]

7 406. Each year, there are approximately **2.5 million pregnancies** in fluoridated areas; *in utero*
8 exposures are thus widespread. Many of those exposed *in utero* will also be exposed during the sensitive
9 neonatal period, with upwards of **1.9 million infants** living in fluoridated areas being fed formula at least
10 part of the time, including over **400,000 infants** who are *exclusively* formula-fed for their first six months.
11 While these numbers do not account for those who use bottled water, the numbers will be substantial
12 regardless. [SOURCE: Grandjean Decl. ¶ 158-159; Thiessen Decl. ¶¶ 162, 180, 220]
13

14 E. The Severity of the Hazard

15 1. The Nature of the Hazard

16 407. The principal hazard at issue from exposure to fluoridation chemicals is IQ loss, which is
17 an adverse health effect that EPA has enacted regulations to prevent in other chemical contexts.
18

19 408. The ELEMENT/MIREC studies have found an approximate 5-point drop in IQ as maternal
20 urinary fluoride levels increase from 0 to 1 mg/L, which represents the 0% to 75th percentile range of
21 exposures in fluoridated areas.²⁵ The estimate effect size will be greater if the 95th percentile exposures
22 are considered, as the urinary fluoride levels for that subset of pregnant women exceed 1.6 mg/L.
23 [SOURCE: Hu 6/8 Tr. 60:6-23; Grandjean Decl. at 47:14-17; Lanphear Decl. ¶ 32]
24

25 409. To put this effect size in perspective, blood lead levels that are considered indicative of “lead
26

27 ²⁵ When the effect size is expressed as a function of the interquartile range of exposure (i.e., the range
28 between the 25th and 75th percentiles, or approximately 0.64 to 1.07 mg/L), the effect size is approximately
2.5 to 3 IQ points. [SOURCE: Hu Decl. 6/8 Tr. 58:5-23, 60:6-23]

poisoning” (i.e., 5 µg/dL) produce IQ losses in the range of 5 IQ points. [SOURCE: Lanphear 6/10 Tr. 355:4-356:14]

410. EPA has recognized that the loss of even 1 IQ point can have a detrimental effect on lifetime earnings. In its regulatory impact analyses, for example, EPA has cited data showing that a difference of 1 IQ point affects lifetime earnings by an estimated average of 1.76 to 2.38 percent. [SOURCE: Pls’ Ex. 34 (*Lead Regulatory Impact Analysis*) at ES-10; Pls’ Ex. 33 (*Mercury Regulatory Impact Analysis*) at 10-46]

411. What may seem like relatively small shifts to mean population-wide IQ scores can cause significant increases in the number of people with IQ scores less than 70, thereby increasing the occurrence of intellectual disability. [SOURCE: Grandjean Decl. ¶ 134; Hu 6/8 Tr. 59:15-19; Lanphear 6/10 Tr. 368:14-369:15]

412. According to EPA’s Clean Air Scientific Advisory Committee, a 1-to-2 IQ point reduction at the population level is “highly significant from a public health standpoint,” and should be prevented in up to 99.5% of the population. [SOURCE: Lanphear 6/10 Tr. 362:8-364:3]

413. Dr. Bruce Lanphear, who was a member of EPA’s Clean Air Scientific Advisory Committee, explained that the Committee’s conclusion would apply equally to water fluoridation. [SOURCE: Lanphear 6/10 Tr. 362:8-364:3]

414. Based on the average difference in maternal urinary fluoride levels between women living in fluoridated vs. non-fluoridated areas (=0.4 mg/L), the average difference in IQ score under current conditions would be expected to be in the range of 2 IQ points. [SOURCE: Grandjean Decl. ¶¶ 156-157]

415. When accounting for the extensive, nationwide reach of fluoridation in the U.S., the number of IQ points potentially being lost from this condition of use rivals the population-wide effects of lead, and exceeds the population-wide effects of mercury. [SOURCE: Grandjean Decl. ¶¶ 158-160]

416. For the reasons stated, the nature of the hazard at issue is unquestionably serious.

2. The Reversibility of the Hazard

417. It is well recognized that damage inflicted to the brain during its development is more likely to be permanent (i.e., irreversible) than damage that occurs during the healthy adult years. [SOURCE: Grandjean Decl. ¶ 40; Lanphear Decl. ¶ 17; Thayer 6/10 Tr. 442:22-443:3; Lanphear 6/10 Tr. 348:10:349:4]

418. The findings of the ELEMENT study are consistent with prenatal fluoride causing a permanent, or at least long-lasting effect, on the brain (Bashash 2017). The study examined the IQs of children at age 4, as well as at ages 6-to-12, and found an association with IQ loss at both ages, thus suggesting an ongoing cognitive deficit over time. [SOURCE: Hu Decl. ¶ 23]

F. Uncertainties

419. Uncertainties are a pervasive aspect of risk assessment; their existence do not negate a finding of risk. [SOURCE: Undisputed Fact No. 17; Thiessen Decl. ¶ 222]

420. When TSCA was enacted in 1976, Congress stated that “factual certainty respecting the existence of an unreasonable risk of a particular harm may not be possible and the bill does not require it.” Congress thus contemplated regulatory action under TSCA “even though there are uncertainties as to the threshold levels of causation.” [SOURCE: H.R. No. 94-1341, July 14, 1976, at 32]

421. Congress recognized that “uncertainty is particularly likely to occur when dealing with the long term or chronic effects of a substance.” [SOURCE: H.R. No. 94-1341, July 14, 1976, at 32]

1. Uncertainties in the Human Data

422. Every epidemiological study has limitations, and that includes the NIH-funded ELEMENT and MIREC studies. [SOURCE: Hu Decl. ¶ 31; Hu 6/8 Tr. 76:21-24; Chang 6/15 Tr. 806:21-23]

423. No limitation has been identified in the ELEMENT and MIREC studies that provides a likely explanation for the significant adverse associations between fluoride exposure and neurodevelopmental harm. [SOURCE: Hu Decl. ¶¶ 31-36; Lanphear Decl. ¶¶ 66-70; Chang 6/16 Tr. 921:22-922:15].

a. Exposure Imprecision

424. One of the limitations that has been identified with the ELEMENT and MIREC studies is that the exposure measurements (e.g., urinary fluoride and maternal beverage intake) are an imprecise marker of the mothers' fluoride exposure during the full course of pregnancy. For example, the studies used spot urine samples which are considered a less precise measure of exposure than 24-hour samples.²⁶ [SOURCE: Hu Decl. ¶¶ 32-34; Lanphear Decl. ¶¶ 67-68; Chang Decl. ¶¶ 242-252].

425. Exposure imprecision is unlikely to explain the consistent associations that the ELEMENT and MIREC studies have found between prenatal fluoride exposure and neurodevelopmental harm. This is because, as the EPA itself has recognized, exposure imprecision is *most likely to bias the results towards the null* (i.e., bias the results towards showing no association). [SOURCE: Hu Decl. ¶ 34; Lanphear Decl. ¶ 68; Hu 6/8 Tr. 71:7-72:14; Hu 6/10 Tr. 330:8-331:9; Grandjean 6/9 196:21-197:15; Lanphear 6/10 Tr. 370:11-19; Pls' Ex. 33A at 9-11]

426. While exposure imprecision can occasionally bias the results away from the null, this is the exception and not the rule. Thus, when dealing with a body of literature that is consistently reporting significant associations between fluoride and reduced IQ (including in the cross-sectional studies), exposure imprecision is an improbable basis for the association. [SOURCE: Grandjean 6/9 Tr. 196:9-20; Thayer 6/12 Tr. 629:18-630:6]

b. Potential for Uncontrolled Confounding

427. Although the ELEMENT and MIREC studies rigorously controlled for potential confounding factors, they cannot rule out the potential for uncontrolled confounding. This is not a limitation specific to the ELEMENT and MIREC studies, but to observational studies in general. [SOURCE: Hu Decl. ¶ 35; Lanphear Decl. ¶ 70]

²⁶ Using 24-hour samples would have impacted other aspects of the study. For example, it would have reduce the sample size (and thereby reduce the statistical power), and it would have introduced a potential source of selection bias. [SOURCE: Hu Decl. at 13:12-14; Chang 6/16 Tr. 915:10-15]

1 428. The EPA has theorized that the factors which influence *creatinine* levels in urine could be
2 the true cause of the association between creatinine-adjusted urinary fluoride levels and IQ loss. This theory
3 finds no support in the peer-reviewed literature and has not been deemed a basis of concern by specialists
4 at the NIH. [SOURCE: Hu 6/10 Tr. 334:11-17]

5 429. The possibility that the factors that influence creatinine are the true cause of the IQ loss is
6 unpersuasive for at least two reasons. First, the association between prenatal fluoride exposure and IQ has
7 also been found with *specific gravity*-adjusted urine, maternal fluoride *intake*, and *water fluoride*
8 concentration. Second, the ELEMENT and MIREC studies excluded people with the types of conditions
9 that would cause pathological abnormalities in creatinine excretion, and there is no evidence that normal
10 variations in creatinine excretion among otherwise healthy people would affect IQ. [SOURCE: Hu 6/8 Tr.
11 99:3-9, 100:12-19, 101:2-102:16; Hu 6/10 Tr. 333:24-333:9; Grandjean 6/9 Tr. 178:7-15, 186:23-187:2;
12 Lanphear 6/10 at 356:17-357:16]

13
14 **c. Sex-Specific Effects**

15 430. One source of uncertainty in the human data is the sex-specific association between maternal
16 urinary fluoride and IQ in the MIREC study. As is often the case, the reason for this sex-specific finding is
17 not currently known. [SOURCE: Lanphear Decl. ¶ 48]

18 431. It is not uncommon for neurotoxicants to cause sex-specific effects. Prior studies of the
19 MIREC cohort, for example, have found sex-specific effects with lead, where low-level exposure was only
20 found to correlate with IQ in boys, not girls. Also, it is well known that boys have a higher prevalence of
21 neurodevelopmental disorders in general than girls. [SOURCE: Lanphear Decl. ¶ 48; Tsuji 6/15 Tr. 768:7-
22 10]

23 432. In the case of fluoride, some animal studies have suggested that males are more susceptible
24 to the effects of *prenatal* fluoride exposure, whereas females are more susceptible to the effects of *postnatal*
25 exposure. This may help explain why the MIREC study found significant associations with reduced IQ in
26
27
28

1 both sexes when using the water-fluoride and fluoride-intake measures of exposure, as these measures may
2 better correlate with postnatal exposure than maternal urine. [SOURCE: Lanphear Decl. ¶ 49; Lanphear
3 6/10 Tr. 396:5-19; Thayer 6/12 Tr. 646:1-14]

4 433. Few other epidemiological studies on fluoride neurotoxicity have investigated sex-specific
5 responses. The ELEMENT study, for example, found a significant association between maternal urine-
6 fluoride and IQ in an analysis that combined both sexes. A subsequent sex-specific analysis of the
7 ELEMENT cohort has been conducted and found “similar results” as the MIREC cohort, but this analysis
8 has not yet been published. [Lanphear 6/10 Tr. 395:8-20]

9
10 **d. Lack of Safety Data and Research on Susceptible Populations**

11 434. The studies upon which current fluoride safety standards are based focused primarily on
12 skeletal effects and did not address the potential for fluoride to cause neurological effects, including IQ
13 loss. As a result, the “safe” or “tolerable” dose of fluoride exposure with respect to neurologic health has
14 not been established and is currently unknown. [SOURCE: Undisputed Facts Nos. 20 & 24; Thiessen
15 Decl. ¶ 34; 2d Am. Appendix C (*CDC Representative*) at 20:14-22:3; Pls’ Ex. 14 (*FDA Declaration*) at
16 008; Pls’ Ex. 16 (*Fluoridation Chemical Manufacturers*)]

17
18 435. Additionally, of the human studies that been conducted to date on fluoride neurotoxicity,
19 few have failed to examine how the risk may vary across the population based on life-stage (e.g., the
20 elderly), and other intrinsic sources of susceptibility, such as renal impairment, nutritional deficiencies,
21 and genetic predisposition. The available data thus makes it difficult to quantify the extent to which
22 susceptibility varies across the population. Of particular concern are individuals with multiple co-existing
23 susceptibilities, such as pregnant women with iodine deficiencies. [SOURCE: Thiessen Decl. ¶ 210]

24
25 436. The absence of safety data, coupled with the absence of research on human variability, is a
26 source of uncertainty that must be considered. However, this uncertainty counsels in favor of greater
27 precaution, rather than less.
28

2. Uncertainties in the Animal Data

437. There is no dispute that fluoride causes neurotoxic effects in animals.²⁷ However, as with the animal studies that EPA has relied upon in other risk assessments,²⁸ the existing animal data on fluoride neurotoxicity has some uncertainties.

438. According to the NTP, the major limitation in the animal data is that the studies reporting impairments in learning/memory have generally failed to rule out the possibility that the impairments may be caused by fluoride-induced neurotoxic effects on the motor or sensory system. However, effects on the motor and sensory systems are also neurotoxic effects, and thus limitation does not have a bearing on whether fluoride is, or is not, a neurotoxicant. [SOURCE: Thayer 6/10 Tr. 452:14-24]

439. Other methodological limitations with the animal data may serve to bias the results, albeit in conflicting directions. Some limitations (e.g., lack of blinding, lack of control for litter effects, and lack of randomization) may serve to inflate the effect, while other limitations (e.g., lack of neonatal exposures, lack of chronic exposures, and lack of testing for factors that increase susceptibility) will serve to deflate it. The net effect of these limitations is unclear. [SOURCE: Thiessen Decl. ¶¶ 203 & 211]

440. Three considerations provide grounds for confidence in the animal neurotoxicity data for fluoride. First, the studies have been remarkably *consistent* in finding adverse effects. See *supra* ¶¶ 117 & 125. Second, the studies have consistently found dose-response relationships, which adds support to a true causative link. See *supra* ¶ 202. Third, studies have found adverse effects in the absence of any bodyweight changes, which supports fluoride causing a direct effect on the brain, rather than an indirect effect through systemic toxicity. See *supra* ¶ 132-135.

²⁷ See Thayer 6/10 Tr. 445:8-11, 449:22-25; Tsuji 6/15 Tr. 720:14-16; Chang 6/15 Tr. 893:8-24; EPA counsel 6/17 Tr. 1088:10-11.

²⁸ The principal animal studies that EPA has relied upon for its neurotoxicity risk assessments have also had methodological limitations, including failure to control for litter effects. There was also significant uncertainty in the animal data that EPA used for its unreasonable risk determinations for its draft NMP evaluation (e.g., there were only 6 studies available for the endpoint of concern, and three found no effect). [SOURCE: Thiessen Decl. at p. 78 n. 291]

G. Confidence in the Data Used for Risk Estimates

441. Another factor that EPA may consider in the risk determination is the confidence it has in the data used for the risk estimate. This includes the (1) Point of Departure, (2) uncertainty factors, and (3) human exposure data. [SOURCE: Henry Decl. ¶ 181]

1. Point of Departure

442. The principal Point of Departure for the risk estimates on fluoridation is the BMDL derived from the ELEMENT and MIREC studies. The following features of the BMDL lend confidence to its use as the Point of Departure:

443. The BMDL is based on human data and thus involves no extrapolation from animals. [SOURCE: Thiessen Decl. ¶¶ 43 & 114]

444. It is undisputed that the human studies that the BMDL is based on are the most reliable data on fluoride neurotoxicity in the scientific literature. [SOURCE: Undisputed Fact No. 10]

445. The BMDL is derived from studies of populations exposed to “optimal” levels of fluoride, and is within the “field of observation” in the dataset. There is thus no need to extrapolate from high exposures to low exposures, which is a feature that adds confidence to BMD analyses. [SOURCE: Thayer 6/12 Tr. 668:20-669:3]

446. The BMDL is based on a linear dose-response model that is consistent with the statistical analyses of the study authors, and separately confirmed through an independent analysis of the extracted IQ data from the ELEMENT study. [Hu Decl. ¶ 22; Lanphear Decl. ¶ 43; Grandjean 6/9 Tr. 254:16-255:11; 255:25-257:11]

2. Uncertainty Factors

447. As the name implies, uncertainty factors introduce an inherent degree of uncertainty to a risk estimate. But here, the risk estimates based on the BMDL do not require the application of a single uncertainty factor. This is because human exposure exceeds the BMDL (i.e., *exceeds the Point of Departure*

1 *itself*). This fact lends further confidence to the risk estimates. [SOURCE: Grandjean Decl. ¶ 145]

2 **3. Human Exposure**

3 448. The human exposure data that the risk estimates are based upon (i.e., biomonitoring studies
4 of urinary fluoride levels in fluoridated areas, and EPA water ingestion data) are much straightforward than
5 the exposure estimates that EPA has had to do for some of its risk evaluations under Section 6. [SOURCE:
6 Thiessen Decl. ¶ 223]

7 449. In its risk evaluation of NMP, the EPA needed to make many assumptions in order to
8 estimate how much of the chemical humans would be exposed in the workplace when using personal
9 protective equipment. To estimate exposure, EPA needed to make “*assumptions* about glove use, glove
10 effectiveness, duration of contact with NMP, concentration of NMP, and amount of skin surface contact
11 with NMP.” [SOURCE: Thiessen Decl. ¶ 223; Pls’ Ex. 49 (NMP Evaluation) at 310]

12 450. While EPA recognized that this sequence of assumptions created uncertainty in its NMP
13 exposure estimates, the Agency had sufficient confidence to make unreasonable risk determinations.
14 [SOURCE: Thiessen Decl. ¶ 223; Pls’ Ex. 49 (NMP Evaluation) at 310]

15 451. Here, the small-scale nature of the UCSF study, coupled with the absence of nationally
16 representative urinary fluoride data, creates a source of uncertainty as to current urinary fluoride levels in
17 pregnant women in the United States. See *supra* ¶ 329 & n.18

18 452. This uncertainty, however, is largely immaterial because there is sufficient toxicokinetic
19 information to confidently conclude that urinary fluoride levels will generally approximate the water
20 fluoride level and be well above the BMDL. See *supra* ¶¶ 317-318, 399.

21 453. Finally, with respect to EPA’s 2019 water intake data, a source of uncertainty arises from
22 the fact that it is based on short-term surveys, and thus may not precisely reflect long-term consumption
23 patterns. However, this limitation notwithstanding, the EPA has recognized this data to be “scientifically
24 sound” and the best data currently available for risk assessment. [SOURCE: Thiessen ¶ 156]

IX. CAUSATION ANALYSIS

A. Causation Is a Relevant Consideration for the *Hazard* Determination

454. Under TSCA, it is not necessary to prove causation in order to demonstrate an unreasonable risk. In fact, EPA has never once used a causation standard in any of its risk evaluations under Section 6. [SOURCE: Undisputed Fact No. 16; EPA Counsel 6/17 Tr. 1109:5-8; Henry 6/16 Tr. 987:6-8]

455. While not a prerequisite finding, causation is a relevant consideration for a *hazard* determination. [SOURCE: Henry 6/16 Tr. 1013:8-10; Henry Decl. ¶ 100]

456. The hazard inquiry focuses on whether the chemical can cause a neurotoxic effect at any level of exposure, and is *not limited to the exposures under the conditions of use*. Nevertheless, while causation is *relevant* to the hazard inquiry, EPA's *Guidelines* do not require proof of causation in order to conclude that a chemical poses a neurotoxic hazard. [SOURCE: Thayer Tr. 445:8-11; Thiessen Decl. ¶ 42 & 44; Pls' Ex. 17 (*Guidelines*) at 53]

457. Since causation is not necessary for a *hazard* determination (where the inquiry is *not* limited to the exposures under the conditions of use), it is even *less* necessary to the *risk* characterization/determination (where the inquiry *is* limited to the exposures under the conditions of use).

B. Causation Supports the Hazard (and Risk) Determination for Fluoride

458. Although not necessary to a hazard or risk determination, a causation analysis supports, rather than detracts from, the conclusion that fluoridation poses an unreasonable risk. [SOURCE: Grandjean Decl. ¶ 125]

459. First, it is undisputed that fluoride causes neurotoxic effects at high levels of exposure. The dispute regarding causation is thus limited to whether fluoride causes neurotoxic effects under the condition of use (i.e., water fluoridation). [SOURCE: Thayer 6/10 Tr. 449:22-25; Chang 6/15 Tr. 893:8-24; EPA Counsel 6/17 Tr. 1088:10-11]

460. The "Bradford Hill" guidelines are the guidelines that epidemiologists use to assess whether

an association reflects a true causal relationship. [SOURCE: Chang 6/15 Tr. 797:5-8]

1. Strength (Effect Size)

461. All else being equal, a strong association between a chemical and a health outcome is less likely to result from confounding and bias than a small association. [SOURCE: Chang Decl. ¶ 200]

462. The magnitude of an effect has to be considered in the specific context of the health outcome being studied. What might be a small magnitude of effect for one outcome (e.g., a 5% decrease in function), might be a large effect size for another. [SOURCE: Thayer 6/12 Tr. 632:1-6]

463. Dr. Ellen Chang opined in this case that the magnitude of effect in the ELEMENT and MIREC studies is “relatively small” and “modest” when compared to the standard deviation of 15 IQ points. Based on this Dr. Chang concluded that “the strength of the observed associations does not provide persuasive evidence” of a causal effect. [SOURCE: Chang 6/15 Tr. 887:9-23; Chang Decl. ¶¶ 201-202]

464. The problem with Dr. Chang’s contention is that no chemical, not even known neurotoxicants like lead and mercury, cause an average loss of 15 points from general population exposures. Dr. Chang failed to appreciate this fact because she did attempt to assess the magnitude of effect of lead and other known neurotoxicants on IQ. Her assessment of fluoride’s magnitude of effect thus failed to consider the specific context of the health outcome being studied. [SOURCE: Chang 6/15 Tr. 889:4-16; Hu 6/8 Tr. 67:16-19; Grandjean 6/9 Tr. 199:19-21; Lanphear 6/10 Tr. 369:17-20]

465. When viewed in the context of other neurotoxicants, the effect size of fluoride on IQ is large and rivals, in fact, the effect of lead. The strength factor thus supports a causal inference. [SOURCE: Hu Decl. ¶ 23; Lanphear Decl. ¶ 47; Grandjean Decl. ¶ 112; Lanphear 6/10 Tr. 355:4-356:14; Grandjean 6/9 Tr. 157:24-158:4]

2. Consistency

466. In general, a consistent observation of an association across study settings and research groups reduces the likelihood that the association is due to chance. [SOURCE: Chang Decl. ¶ 203]

1 467. The consistency of the association between fluoride and neurotoxic endpoints is one of the
2 most compelling aspects of the epidemiological research to date. Every study that has examined the effect
3 of prenatal fluoride exposure has found a significant association with adverse neurodevelopmental effects,
4 and cross-sectional studies of endemic fluorosis areas have consistently found adverse effects on IQ.
5 [SOURCE: Thiessen Decl. ¶ 59; Grandjean Decl. ¶¶ 87, 113-114]

6 468. Dr. Chang fails to acknowledge the consistency of the prenatal findings, and emphasizes
7 instead the absence of associations seen in the New Zealand studies (Broadbent 2015; Shannon 1986;
8 Spittle 1998) and two cross-sectional studies (Morgan 1998, Barberio 2017). Although Dr. Chang agrees
9 that the ELEMENT and MIREC studies are superior to these other studies, her analysis of consistency fails
10 to address the impact of the differences in the studies' methodologies, including the absence of prenatal
11 measurements. [SOURCE: Chang Decl. ¶¶ 204-205, 208; Chang 6/15 Tr. 806:19-20 & 886:6-887:3]

12 469. Inconsistencies only reduce confidence in an association if they cannot be explained.
13 [SOURCE: Thayer 6/12 Tr. 629:18-630:6]

14 470. The apparent inconsistencies between the ELEMENT/MIREC studies and the New Zealand
15 studies can be explained by their different methodologies, including the latter's failure to assess the *timing*
16 of exposure, including during the *prenatal* period. For example, the Broadbent study's only information on
17 fluoridation exposure was the child's residence at age 5 (or age 3 if residential information at age 5 was
18 missing). The Broadbent study thus *had no information on a child's fluoridation exposure for the first 3 to*
19 *5 years of life*, including the prenatal period. [SOURCE: Chang Decl. Tbl. 2 (ECF No. 200) at 114]

20 471. Elsewhere in her report, Dr. Chang acknowledged the problems with the exposure metrics
21 used in the New Zealand studies. Her assessment of consistency, however, fails to acknowledge these
22 problems, and their potential for explaining the apparent discrepancies among the studies. [SOURCE:
23 Chang Decl. at p. 60:17-21 (discussing the problems with the New Zealand exposure metrics in the context
24 of temporality)]
25
26
27
28

1 472. The New Zealand studies also used a crude group-level measure of exposure (i.e., residence
2 in a fluoridated area), and these crude measures will have greater exposure imprecision than the
3 individualized measures in the ELEMENT/MIREC studies. As a result, the New Zealand studies are at
4 higher risk of bias towards the null than the ELEMENT/MIREC studies. [SOURCE: Grandjean 6/9 Tr.
5 168:13-16; Chang Decl. at 35:20-22; Pls' Ex 33A at 9-11]

6 473. Dr. Chang's failure to consider how differences in the studies' methodologies could explain
7 the apparent inconsistencies is a significant weakness in her analysis. [SOURCE: Grandjean Decl. ¶¶ 90-
8 96, 113; Grandjean 6/9 Tr. 201:25-202:15]

9 474. Finally, the notion that the New Zealand studies materially conflict with the
10 ELEMENT/MIREC studies is belied by the assessment of EPA's senior scientist who specializes on
11 fluoride issues at the Office of Water, Dr. Joyce Donohue, as well as admissions by the EPA itself. Dr.
12 Donohue testified that there were no studies which rebutted the ELEMENT/MIREC studies and that she is
13 unaware of any studies which demonstrate or support the neurological safety of prenatal fluoride exposure.
14 EPA made a similar admission, stating that the only study it is aware of which demonstrates or supports
15 the safety of prenatal fluoride exposure is an animal study by Mullenix.²⁹ [SOURCE: 2d Am. Appendix
16 (Donohue) at 42:13-43:22; 2d Am. Appendix (EPA Interrogatory Responses) at 1:21-28]

19 3. Temporality

20 475. A causal exposure must precede an outcome in time. [SOURCE: Chang Decl. ¶ 226]

21 476. The requirement of temporality is met with fluoride as the ELEMENT/MIREC prospective
22 studies followed best practices and measured fluoride during the prenatal period. The exposure
23 measurement thus preceded the outcome, which is what the temporality factor is supposed to assess.
24 [SOURCE: Grandjean Decl. ¶ 118]

25
26
27 ²⁹ Contrary to EPA's assertion, the Mullenix does not demonstrate or support the neurological safety
28 of prenatal fluoride exposure, as even EPA's own expert conceded. [SOURCE: Tsuji 6/15 Tr. 767:23-
768:1; Lanphear 6/10 Tr. 396:5-19; Thiessen 6/17 Tr. 1037:17-22; Grandjean Decl. ¶ 53]

477. In contrast to the ELEMENT/MIREC studies, the New Zealand studies are much less informative on temporality due to their failure to investigate early-life exposures. For example, the Broadbent study had no information on exposure to fluoridated water prior to age 3, and thus it is possible that the assessment of exposure *post-dated* the cause of the IQ loss. [SOURCE: Chang Decl. at p. 60:17-24]

4. Biological Gradient (Dose Response)

478. Higher risk or greater severity of an outcome with increasing exposure (i.e., a dose-response trend or gradient) provides support for a causal inference. [SOURCE: Chang Decl. ¶ 210]

479. The ELEMENT and MIREC studies have each found linear dose-response relationships between prenatal fluoride exposure and neurodevelopmental harm. This is an important fact that weighs in favor of a causal inference, particularly since the linearity of the relationship was scrutinized through statistical testing, and was not merely assumed. [Hu Decl. ¶ 22; Lanphear Decl. ¶ 43; Grandjean 6/9 Tr. 254:16-255:11; 255:25-257:11]

480. Dr. Chang agrees that the ELEMENT/MIREC studies “provide some evidence of a monotonic exposure-response trend,” but she dismisses the significance on several faulty grounds. [SOURCE: Chang Decl. ¶ 218]

481. Dr. Chang notes that the Shannon (1986) and Barberio (2017) studies did not find exposure-response trends, but again fails to address their relative weaknesses vis-à-vis the ELEMENT/MIREC studies, including lack of prenatal data, lack of any information on the timing of exposure, and lack of any individualized biomarkers. [SOURCE: Chang Decl. ¶ 211]

482. Dr. Chang suggests that outliers may have distorted the effects seen in the studies by Bashash (2018) and Green (2019) without acknowledging that statistical analyses on the impact of outliers were conducted and that the results did not meaningfully change. [SOURCE: Chang Decl. ¶¶ 214-215; Hu Decl. ¶ 22; Lanphear Decl. ¶ 57; Grandjean Decl. ¶ 199]

1 483. Dr. Chang also points to the large degree of scatter in the scatterplots, but fails to note that
2 such scatter is common in analyses of neurotoxicants and IQ, including lead, and that the biostatistical
3 principles underlying regression analyses are better equipped to account for this scatter than the naked eye.
4 [SOURCE: Chang Decl. ¶ 217; Hu Decl. ¶ 30; Grandjean Decl. ¶ 119; Grandjean 6/9 Tr. 202:16-203:15,
5 204:7-205:4]

6 5. Coherence

7 484. In her assessment of coherence, Dr. Chang did not consider evidence that is supportive of
8 coherence. Dr. Chang did not consider, for example, whether a causal relationship between fluoride and
9 reduced IQ is coherent with findings of reduced IQ among both formula-fed and children with kidney
10 disease (i.e., populations that are known to have significantly elevated exposures to fluoride). [SOURCE:
11 Chang Decl. ¶¶ 223-224; Chang 6/15 Tr. 896:6-14; Thiessen Decl. ¶¶ 174, 178, 186; Grandjean Decl. at p.
12 35:1-4]
13

14 485. Dr. Chang also did not consider whether the MIREC study of boys suffering greater harm
15 from prenatal fluoride exposure is coherent with data showing that boys suffer from a higher prevalence of
16 neurodevelopmental disorders than girls. [SOURCE: Chang 6/15 Tr. 897:3-8; Lanphear Decl. ¶ 48]
17

18 486. Instead of considering these factors, Dr. Chang focused exclusively on the findings of
19 several studies which suggest that IQ scores increased throughout the twentieth century in western
20 countries. At trial, however, Dr. Chang conceded that the purported increase in IQ “is not an important
21 consideration.” [SOURCE: Chang Decl. ¶ 224; Chang 6/15 Tr. 894:16-895:3, 896:3-5]
22

23 487. Whether or not IQ has actually increased in western societies (i.e., “the Flynn Effect”) is a
24 subject of dispute. To the extent the increase is real, it is incorrect to interpret it as meaning that
25 environmental toxicants could not have reduced IQ during this period of time. For example, during the
26 timeframe of the Flynn Effect, leaded gasoline was introduced into the market, and leaded gasoline is well
27 established to have reduced IQ. [SOURCE: Grandjean 6/9 Tr. 207:20-209:18]
28

1 488. As with her analysis of several of the other Bradford Hill factors, Dr. Chang's analysis of
2 coherence would weigh equally against a causal relationship between lead and IQ. [SOURCE: Grandjean
3 Decl. ¶ 124; Grandjean 6/9 Tr. 200:3-9, 203:12-13, 209:9-11]

4 **6. Specificity**

5 489. When a chemical is associated with an effect that has few other known causes (e.g. asbestos
6 and mesothelioma), the causal inference is strengthened. Conversely, the absence of such specificity does
7 not weigh against a causal inference. The fact, therefore, that other factors can reduce IQ does not weigh
8 against a causal relationship with fluoride. [SOURCE: Chang Decl. ¶ 225; Grandjean Decl. ¶ 117]
9

10 **7. Biological Plausibility**

11 490. In her assessment of biological plausibility, Dr. Chang places heavy reliance on the NTP's
12 systematic review of the animal literature. According to the principal author of the NTP review, the animal
13 data *supports* the biological plausibility of fluoride causing neurotoxic effects in humans. [SOURCE:
14 Chang Decl. ¶ 220; Thayer 6/10 Tr. 450:9-13]
15

16 491. The biological plausibility of the epidemiological association found between early-life
17 fluoride exposure and neurotoxicity is supported by the following considerations: (1) fluoride passes
18 through the placenta and gets into the fetal brain; (2) bottle-fed infants are exposed to a very high burden
19 of fluoride at a point in time when the brain is still rapidly developing and the blood brain barrier is not yet
20 fully developed; (3) fluoride interferes with the brain in animal studies, as reflected by changes within the
21 brain following fluoride exposure; (4) fluoride reduces thyroid function, which provides a plausible
22 mechanism for prenatal fluoride impacting neurodevelopment; and (5) a chemical which can impair
23 learning in *adult* animals is reasonably likely to impair learning if ingested during the *more vulnerable*
24 prenatal/neonatal stage of life. None of these considerations were addressed by Dr. Chang in her
25 assessment. See *supra* ¶¶ 192-208.
26
27
28

8. Experimental

492. Experimental evidence in human beings is generally lacking for environmental toxicants due to ethical prohibitions on human experimentation. [SOURCE: Hu Decl. ¶ 31; Thayer 6/10 Tr. 448:22-24]

493. In her assessment of experimental evidence, Dr. Chang focused solely on the fact that there are no studies that have compared IQ in communities before and after the commencement of water fluoridation. [SOURCE: Chang Decl. ¶ 230]

494. In limiting her focus to this specific type of study, Dr. Chang ignored the NRC's observation that some of the case reports of fluoride toxicity constitute "experimental studies" of neurologic symptomatology following fluoride exposure. The case reports involve "one or more individuals who underwent withdrawal from their source of fluoride exposure and subsequent re-exposures under 'blind' conditions." In most cases, the symptoms "disappeared with the elimination of exposure to fluoride and returned when exposure was reinstated." [SOURCE: Grandjean Decl. ¶ 123; Pls' Ex. 13 (*NRC Report*) at 208-209]

1 **X. STANDING**

2 495. In light of the ubiquity of fluoridation chemicals in commercial beverages and foods in the
3 United States coupled with the absence of labeling for fluoride content, it is, and has been, virtually
4 impossible for Plaintiffs to eliminate fluoridation chemicals from their lives. [SOURCE: Grandjean Decl.
5 ¶¶ 150 & 156; Thiessen Decl. ¶ 155; Pls' Ex. 41A (EPA Report) at 3437; Pls' Ex. 53 (Lavelle Decl.) ¶ 15;
6 Pls' Ex. 55 (Staudenmaier Decl.) at 13]

7 **A. Food & Water Watch**

8 496. Food & Water Watch is a nonprofit membership organization that champions healthy food
9 and water for all, with 70,000 members nationwide. [SOURCE: Pls' Ex. 52 (Edwards Decl.) ¶¶ 2-5]

10 497. Food & Water Watch's mission is to advocate for more government responsibility in
11 protecting U.S. drinking water resources, including proper regulation of the addition of harmful additives
12 and chemicals, like fluoridation chemicals, to the nation's water supplies. [SOURCE: Pls' Ex. 52 (Edwards
13 Decl.) ¶ 5]

14 498. Food & Water Watch's advocacy efforts include public education and outreach efforts to
15 members and the general public, and legal efforts to oppose regulatory actions that threaten the safety of
16 our nation's food and water. This action is one such legal action. [SOURCE: Pls' Ex. 52 (Edwards Decl.)
17 ¶¶ 5-6]

18 499. Food & Water Watch relies upon the standing of its individual members, including Jessica
19 Trader, Julie Simms, and Plaintiff Audrey Adams, to establish standing. [SOURCE: Pls' Ex. 52 (Edwards
20 Decl.) ¶¶ 5, 8-10]

21 **B. Jessica Trader**

22 500. Jessica Trader is a member of Food & Water Watch who lives in San Francisco, which
23 fluoridates its water. [SOURCE: Pls' Ex. 57 (Trader Decl.) ¶¶ 2, 7, 9]

24 501. Ms. Trader was diagnosed with dental fluorosis, which is a disorder of tooth enamel that is
25
26
27
28

1 indisputably caused by fluoride. [SOURCE: Pls' Ex. 57 (Trader Decl.) ¶ 3; EPA Ex. 516 at 003 ("Fluoride
2 ingestion while teeth are developing can result in a range of visually detectable changes in the tooth enamel
3 called dental fluorosis."))]

4 502. Ms. Trader's dental fluorosis has caused visible dark staining on her front teeth, which has
5 caused her social anxiety and embarrassment because she fears people will find her unattractive, or
6 neglectful of her hygiene. [SOURCE: Pls' Ex. 57 (Trader Decl.) ¶¶ 3-4]

7 503. Ms. Trader's diagnosis of fluorosis has caused her concern about what additional fluoride
8 exposures may do her health, particularly in light of research linking fluoride to disorders of the thyroid
9 gland and brain. [SOURCE: Pls' Ex. 57 (Trader Decl.) ¶ 6]

10 504. In order to minimize her risk of suffering further effects from fluoride, Ms. Trader spends
11 money purchasing spring water, and has purchased a professional water filtration system at her business.
12 [SOURCE: Pls' Ex. 57 (Trader Decl.) ¶¶ 7-8]

13 505. Ms. Trader has indisputably suffered an adverse effect from fluoride exposure (i.e., dental
14 fluorosis), and is sustaining an ongoing economic injury to protect herself from further harm.
15

16 **C. Julie Simms**

17 506. At the age of 14, San Francisco resident Julie Simms began suffering from headaches on a
18 regular basis. [SOURCE: Pls' Ex. 54 (Simms Decl.) ¶ 4]

19 507. Julie had no reason to doubt the safety of fluoridation (and would vote to add it to the water
20 in Newport Beach as an adult) and thus did not monitor the fluoride status of her water supply as she moved
21 around as an adult. [SOURCE: Pls' Ex. 54 (Simms Decl.) ¶¶ 8, 13]

22 508. As she moved between cities, she would experience severe and regular headaches in those
23 she would later learn fluoridated their water (San Francisco, Palo Alto, Seattle), but lived virtually
24 headache-free in those that did not (Chico and Newport Beach, California, and the Tottori prefecture in
25 Japan). [SOURCE: Pls' Ex. 54 (Simms Decl.) ¶¶ 5-10, 13]

1 509. Julie’s headaches became so severe that she sought medical help for them in 1994, when
2 she was officially diagnosed with migraines. [SOURCE: Pls’ Ex. 54 (Simms Decl.) ¶ 6]

3 510. After spending several years in non-fluoridated Newport Beach (where she was free of her
4 migraines), Julie relocated to San Francisco in 1998, only to have the migraines return, occurring up to 20
5 times each year, and bringing with them nausea and vomiting, causing her to lose about two workdays each
6 month. [SOURCE: Pls’ Ex. 54 (Simms Decl.) ¶¶ 7, 9]

7 511. When Julie moved to fluoridated Seattle in 2001, she began to suffer daily low-grade
8 migraines (pain level of 2-3 on a scale of 1-10), with spikes to a pain level of 9-10 several times each
9 month, and with some migraines lasting up to 10 days. [SOURCE: Pls’ Ex. 54 (Simms Decl.) ¶ 10; 2d Am
10 Appendix C (Simms) at 52:16-53:28]

11 512. Julie tried (and paid for) “every remedy [she] could think of”—both prescription
12 medications and over-the-counter treatments, dietary changes, acupuncture, vitamins, meditation,
13 increasing and decreasing the amount of sleep she got, and exercise, and obtaining an MRI—but did not
14 get relief. [SOURCE: Pls’ Ex. 54 (Simms Decl.) ¶¶ 11-12]

15 513. After taking a friend’s suggestion to switch to non-fluoridated water in 2013, Julie
16 experienced significant relief in three days, and within a few weeks her daily headaches had been
17 eliminated—a development she reported to her doctor. [SOURCE: Pls’ Ex. 54 (Simms Decl.) ¶ 13 & Ex.
18 E]

19 514. Julie has continued to restrict her exposure to fluoride, and her daily headaches have *never*
20 returned. Julie still experiences occasional migraines, but they are not as frequent nor as debilitating as they
21 once were—as evident by the fact that Julie no longer uses any medication to treat them. [SOURCE: 2d
22 Am. Appendix C (Simms) at 51:10-15, 55:25-56:9, 57:17-58:28]

23 515. The temporal pattern of Julie’s headaches strongly supports fluoride being a trigger, and is
24 consistent with studies of fluoride hypersensitivity that the National Research Council (NRC) has found to
25

1 be credible. [SOURCE: Thiessen 6/10 Tr. 501:14-502:14, 503:19-24; Thiessen 6/17 Tr. 1036:6-12;
2 Thiessen Decl. ¶ 61; Pls' Ex. 13 (NRC Report) at 208-9]

3 516. Hypersensitive reactions to fluoride include neurological manifestations, including
4 headaches, as documented by Dr. George Waldbott, a prominent allergy specialist whose research has been
5 cited and relied upon by the NRC. [SOURCE: Thiessen 6/10 Tr. 501:14-502:14, 503:19-24; Thiessen 6/17
6 Tr. 1036:6-12; Grandjean 6/9 Tr. 206:5-21]

7 517. In its 2006 review of fluoride's neurotoxicity, the NRC described some of Dr. Waldbott's
8 studies on hypersensitivity as being "in fact, experimental studies," because "one or more individuals who
9 underwent withdrawal from their source of fluoride exposure and subsequent re-exposures under 'blind
10 conditions.'" [SOURCE: Pls' Ex. 13 (NRC Report) at 208-9]

11 518. According to the NRC, "[i]n most cases, the symptoms disappeared with the elimination of
12 exposure to fluoride and returned when exposure was reinstated. In some instances, when the fluoride was
13 given in the water, this procedure was repeated several times under conditions in which neither the patient
14 nor the provider of the fluoride knew the water contained fluoride." [SOURCE: Pls' Ex. 13 (NRC Report)
15 at 208-9]

16 519. In both its 2006 and 2009 reports on fluoride, the NRC found the studies on fluoride
17 hypersensitivity to be credible. [SOURCE: Thiessen 6/17 Tr. 1036:24-1037:1]

18 520. In its 2009 review, the NRC noted that hypersensitive reactions may occur at exposures as
19 low as 0.02 mg/kg/day. [SOURCE: Tsuji 6/15 Tr. 738:5-23; 739:10-15]

20 521. A dose of 0.02 mg/kg/day is exceeded by many adults who drink fluoridated water. In fact,
21 the NRC noted in its 2006 review that some studies show that, just as with Julie Simms, "fluoride-produced
22 symptoms occurred when people moved into a community with a fluoridated water but disappeared when
23 the individuals moved to a nonfluoridated community." [SOURCE: Thiessen 6/17 Tr. 1037:14-16; Thiessen
24 Decl. ¶ 153; Pls' Ex. 13 (NRC Report) at 208-9]

1 522. Dr. Tsuji was a committee member on the NRC's 2009 report and described it as
2 "extensively peer reviewed." [SOURCE: Tsuji 6/15 Tr. 714:1-18; 736:20-737:7]

3 523. In addition to the case reports and double-blinded studies, fluoride has been associated with
4 headaches among people living with naturally elevated levels of fluoride and among occupationally-
5 exposed workers. Although these studies involved higher exposures than Julie Simms would have received
6 from drinking fluoridated water, they are relevant to establishing headaches as a *hazard* of fluoride
7 exposure. [SOURCE: Grandjean Decl. ¶¶ 58-59, 74; Grandjean 6/9 Tr. 206:22-207:17; 300:5-12; Thiessen
8 6/10 Tr. 501:19-24; Thayer 6/10 Tr. 445:8-11]

9 524. Julie has spent considerable sums of money to avoid fluoride. For example, she purchases
10 fluoride-free water, showerhead filters, and has purchased a home water filter. [SOURCE: Pls' Ex. 54
11 (Simms Decl.) ¶¶ 16, 19-20 and Exhibits G-I, K]

12 525. The economic injury that Julie has sustained is based on a credible threat that fluoridated
13 water poses to health. Julie's own experience demonstrates a close temporal proximity between cessation
14 of fluoridated water and cessation of her daily headaches, and shows that (unbeknownst to her at the time)
15 the frequency of her previous headaches aligned closely with the fluoridation status of the areas in which
16 she had lived. These observations are consistent with and further buttressed by studies that the National
17 Research Council has deemed credible which show that hypersensitive reactions, including headaches,
18 occur at doses that people can ingest from drinking fluoridated water.
19
20

21 **D. Audrey Adams (individually and on behalf of her son Kyle)**

22 526. Plaintiff Audrey Adams is the guardian and caretaker of her adult son, Kyle Adams. The
23 family lives in Renton, Washington, where the public water supply is fluoridated. [SOURCE: Pls' Ex. 56
24 (Adams Decl.) ¶ 2]
25

26 527. Kyle's two treating doctors (Dr. Charles Butler and Dr. Nooshin Darvish) have advised
27 Andrey to strictly limit Kyle's exposure to fluoride. It is reasonable for Audrey Adams, as Kyle's caregiver,
28

1 to heed the advice of Kyle’s doctors. [SOURCE: Pls’ Ex. 56 (Adams Decl.) Exs. A, B, & C]

2 528. Dr. Butler has identified fluoride as an “intolerance” or “allerg[y]” for Kyle that is associated
3 with “extreme pain.” [SOURCE: Pls’ Ex. 56 (Adams Decl.) Ex. A and B]

4 529. Dr. Darvish has stated that “[u]pon exposure to fluoride,” Kyle “immediately presents with
5 headaches, body aches” requiring “a great deal of dietary and lifestyle changes” from both he and Audrey.
6 [SOURCE: Pls’ Ex. 56 (Adams Decl.) Ex. C)]

7 530. Increased sensitivity to pain is a neurotoxic effect. [SOURCE: Thiessen Decl. ¶ 79]

8 531. A 2018 animal study by McPherson reported significant increases in pain sensitivity among
9 animals exposed to fluoride at a concentration of 20 mg/L. [SOURCE: Thiessen Decl. ¶¶ 79, 128]
10

11 532. EPA’s expert, Dr. Tsuji, agreed that the McPherson study showed significantly shorter
12 “response latencies . . . indicative of hyperanalgesia (higher pain sensitivity),” further agreeing that the
13 chance that this finding was a fluke was less than 0.5%, and that she “would find any results of McPherson
14 to be meaningful.” [SOURCE: Tsuji Decl. ¶ 94; Tsuji 6/15 Tr. 752:18-753:9; 755:13-16]
15

16 533. Dr. Tsuji considered McPherson (2018) to be the most reliable animal study on fluoride
17 neurotoxicity ever conducted. [SOURCE: Tsuji Decl. ¶ 94; 6/15 Tr. 752:18-753:9]

18 534. According to EPA’s *Guidelines for Neurotoxicity Risk Assessment*, a chemical can be found
19 to pose a neurotoxic hazard based on “data demonstrating an adverse neurotoxic effect in a single
20 appropriate, well-executed study in a single experimental animal species.” [SOURCE: Pls’ Ex. 17
21 (*Guidelines*) at 53]

22 535. The National Research Council has stated that “the inference that results from animal
23 experiments are applicable to humans is fundamental to toxicologic research.” [SOURCE: Undisputed
24 Fact No. 27]
25

26 536. EPA agrees that effects observed in animals are relevant to humans unless human data
27 counterindicate such consideration. [SOURCE: Undisputed Fact No. 28]
28

1 537. Even in the complete absence of human data, the EPA will use animal data to calculate the
2 reference doses used to protect the public. [SOURCE: Thayer 6/10 Tr. 449:3-6]

3 538. Dr. Tsuji agreed that the 20 mg/L fluoride concentration to which the rats were exposed in
4 the McPherson study is the approximate equivalent of a 1.3 mg/L in human beings. [SOURCE: Tsuji 6/15
5 Tr. 763:18-24]

6 539. A hazard finding at 1.3 mg/L provides no safety margin for humans exposed at the slightly
7 lower concentration of 0.7 mg/L. EPA's default assumption is that human variability to a toxicant varies
8 by a factor of 10, which would mean the safe level of fluoride exposure would be approximately 0.13 mg/L.
9 [SOURCE: Thiessen Decl. ¶¶ 133-136, 211; Thiessen 6/10 Tr. 479:8-19]
10

11 540. The advice and observations from Kyle's own treating doctors, along with the increased
12 pain sensitivity reported in the McPherson study give Audrey Adams a credible basis, as Kyle's caregiver,
13 to take steps to restrict Kyle's exposure to fluoridated water.

14 541. Audrey's effort to remedy Kyle's pain by reducing his fluoride exposure has required a
15 significant investment of her time and money, from hours spent procuring thousands of gallons of
16 spring/reverse osmosis water for drinking and cooking, heating fluoride-free water for his sponge baths,
17 locating and installing water filtration systems for his drinking and shower water, researching the water
18 sources used at other locations so that camping trips and family vacations did not result in a spike in his
19 pain, and diligently ensuring that Kyle has fluoride-free water to take to work and on his travels.
20 [SOURCE: Pls' Ex. 56 (Adams Decl.) ¶¶ 7-9, 13-15, 18-21]
21

22 542. The basic expenses necessary to eliminate fluoride from Kyle's environment include an
23 outlay of about \$27 per month on Kyle's drinking water, \$197 for each set of two filtration devices for his
24 shower, and between \$42 and \$60 for each drinking water filter, expenditures that will continue into the
25 future. [SOURCE: Pls' Ex. 56 (Adams Decl.) Ex. G]
26

27 543. Plaintiff Audrey Adams has sustained economic injury to protect her son, Kyle, from
28

1 fluoride exposure in a reasonable attempt to eliminate what Kyle’s doctors have told her is a threat to his
2 health.

3 **E. Kristin Lavelle (individually, and on behalf of her son Neal)**

4 544. Plaintiff Kristin Lavelle—a health professional who works for the San Francisco
5 Department of Public Health—has a credible fear that her past, present and future exposure to fluoridated
6 water may increase her risk of developing Alzheimer’s Disease or dementia in her later years. [SOURCE:
7 Pls’ Ex. 53 (Lavelle Decl.) ¶¶ 2, 5-7]

8 545. More than 15 years ago, Kristin became aware of the hazards of fluoride exposure,
9 particularly as expressed in the NRC’s 2006 literature review. [SOURCE: Pls’ Ex. 53 (Lavelle Decl.) ¶¶
10 3-4]

11 546. Kristin learned that the NRC’s 2006 report reviewed animal studies reporting brain changes
12 in experimental lab animals that parallel the changes seen in humans with dementia and concluding that
13 “fluorides have the ability to interfere with the functions of the brain.” [SOURCE: Pls’ Ex. 53 (Lavelle
14 Decl.) ¶ 7]

15 547. Dementia is a neurological injury that has been associated with fluoride exposure.
16 [SOURCE: Thiessen Decl. ¶¶ 181-5; Grandjean Decl. ¶ 74]

17 548. A 1998 animal study by Varner “found that rats consuming 1 ppm fluoride in drinking
18 water” had “brain changes that appeared consistent with the changes seen in the brains of Alzheimer’s
19 patients.” [SOURCE: Pls’ Ex. 53 (Lavelle Decl.) ¶ 5]

20 549. The National Toxicology Program’s (“NTP”) 2016 study found moderate evidence
21 establishing that fluoride impairs learning and memory in *adult* rodents. [SOURCE: Thayer 6/10 Tr.
22 451:16-25]

23 550. At the NTP, “moderate evidence” is a descriptor that is used when the evidence is sufficient
24 to show a *hazard*. [SOURCE: Thayer 6/10 Tr. 449:18-20]

1 551. The NRC’s 2006 report described multiple changes that have been observed in the brains of
2 fluoride-treated animals that parallel the changes seen in the brains of humans with dementia, including
3 reduction in the number of acetylcholine receptors reported in areas of the brain most important for mental
4 stability and retrieval of memories; increased production of free radicals; substantial enhancement of
5 reactive microglia; the presence of stained intracellular neurofilaments, and the presence of IgM.
6 [SOURCE: Pls’ Ex. 13 (*NRC Fluoride in Drinking Water*) at 221-2]

7 552. The NRC noted that the “magnitude of the changes was large and consistent among the
8 studies” and “are related to signs of dementia in humans.” [SOURCE: Pls’ Ex. 13 (*NRC Fluoride in*
9 *Drinking Water*) at 222]

10 553. The CDC agrees with the NRC on all of these findings. [SOURCE: 2d Am Appendix C
11 (*Hannan*) at 12:21-24; 15:18-19:26]

12 554. Animal studies post-dating the NRC’s 2006 report have also reported associations between
13 fluoride exposure and effects relating to dementia. For example, a 2019 study by Cao and others found
14 that certain mice genetically prone to degenerative brain changes developed neuropathological lesions like
15 those associated with Alzheimer’s after just three months’ exposure to fluoride; the lesions were more
16 severe, and appeared earlier, than lesions seen in the control mice. [SOURCE: Thiessen Decl. ¶ 182]

17 555. Studies of humans have reported an association between fluoride exposure and dementia.
18 For example, a large study by Russ following most persons born in Scotland in 1921, reported that relatively
19 low levels of fluoride were associated with an increased prevalence of dementia in those over 60.
20 [SOURCE: Thiessen Decl. ¶ 183]

21 556. A 2016 study by Li of persons in an endemic fluorosis area in China reported “clearly
22 elevated” rates of cognitive impairment in elderly subjects (81.1%). [SOURCE: Thiessen Decl. ¶ 183;
23 Grandjean Decl. ¶ 74]

24 557. Shao (2003) found that adult fluorosis patients had deficits in language fluency, recognition,
25
26
27
28

1 similarities, associative learning, and working memory as compared to controls. [SOURCE: Grandjean
2 Decl. ¶74]

3 558. The elderly brain is more vulnerable to toxins, including fluoride, because the blood-brain
4 barrier becomes more permeable in old age. [SOURCE: Thiessen Decl. ¶¶ 184-6]

5 559. EPA recognizes that the elderly stage of life is a “critical period[] for exposure” for
6 neurotoxicants, and that the elderly population’s sensitivity to stems from the “limited ability of the [elderly
7 person’s] nervous system to regenerate or compensate to neurotoxic insult.” [SOURCE: Pls’ Ex. 17
8 (*Guidelines*) at 65]

9 560. Kristin’s discovery of studies linking fluoride exposure to dementia and Alzheimer’s
10 Disease has caused her, a health professional, to have concerns for her own future mental health.
11 [SOURCE: Pls’ Ex. 53 (Lavelle Decl.) ¶¶ 4-9]

12 561. Kristin’s research has also taught her that once consumed, fluoride bioaccumulates in bone
13 and re-enters the bloodstream at an increasing rate as the bones begin to break down during the post-
14 menopausal years. The risk of fluoride causing neurologic effects during the elderly years is thus dependent
15 upon how much fluoride has accumulated in the bone throughout life. The reasonable inference is that
16 prevention of bioaccumulation and eventual recirculation of fluoride in the system needs to happen in
17 advance in order to be effective. [SOURCE: Pls’ Ex. 53 (Lavelle Decl.) ¶ 9; Thiessen Decl. ¶ 185].

18 562. To protect against fluoride’s risks—both on her own behalf and on behalf of her son—
19 Kristin has taken steps to limit her current exposures, spending “significant sums of money” filtering
20 fluoride out of her home’s water supply. Among other things, Kristin and her husband incurred the expense
21 of a reverse osmosis filter for one home, supplementing with purchased bottled water for their drinking and
22 cooking needs, later purchasing a “whole house filter” for another home, requiring an outlay of more than
23 \$2,000. [SOURCE: Pls’ Ex. 53 (Lavelle Decl.) ¶¶ 3-6, 10-11 and Exs. A, B]

24 563. Kristin also purchased Berkey water filters (which must be replaced periodically), and test
25
26
27
28

1 kits to verify that both the Berkey filters and the whole house devices were filtering most fluoride out of
2 the family's drinking water. [SOURCE: Pls' Ex. 53 (Lavelle Decl.) ¶¶ 12-13 and Exhibits C, D]

3 564. Due to the widespread extent of fluoridation in the U.S., and the fact that the labels on
4 processed foods and commercial beverages made with fluoridated water do not reveal their fluoride content,
5 it is difficult, if not impossible, for Kristin to eliminate fluoride from the her and her son's diet. [SOURCE:
6 Pls' Ex. 53 (Lavelle Decl.) ¶ 15]

7 565. Plaintiff Kristin Lavelle has sustained economic injury in her reasonable efforts to protect
8 herself and her family from credible concerns about the potential long-term neurological health
9 consequences of fluoride exposure. While this is not a proven risk, it is of sufficient gravity to give the
10 National Research Council cause for concern. [SOURCE: Pls' Ex. 53 (Lavelle Decl.) ¶¶ 5-7, 10-13, 16
11 and Exhibits A-D]

12 566. While Kristin is not yet elderly herself, the only way to fully prevent the future risk is by
13 taking steps in the present to minimize the accumulation of fluoride in the body. The risk is thus effectively
14 an immediate one.
15

16 **F. Brenda Staudenmaier**

17 567. Plaintiff Brenda Staudenmaier holds an Associate Degree in Environmental Engineering-
18 Waste & Water Technology and currently works at the Metropolitan Sewer District in Madison, Wisconsin.
19 [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶¶ 2-3]
20

21 568. Brenda has two sons, Ko (age 8) and Hayden (age 16). [SOURCE: Pls' Ex. 55
22 (Staudenmaier Decl.) ¶ 4]
23

24 569. Brenda is generally concerned about the effects that fluoride exposure might have on her
25 sons' health, particularly the adverse effects fluoride exposure can have on the brain and cognition.
26 Brenda's son, Ko, appears to have ADHD, and Brenda fears it may be related to the fluoride exposure that
27 she could not afford to avoid when she was pregnant with him. He also has markings on his teeth that
28

1 appear to be consistent with dental fluorosis. [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶¶ 8, 10]

2 570. Fluoride has been associated with ADHD in two recent North American studies (Bashash
3 2018, Riddell 2019), with one study from Canada finding a six-fold higher odds of developing ADHD
4 among 6-to-17 year old children living in areas with fluoridation (Riddell 2019). [SOURCE: See *supra* ¶¶
5 175-180.

6 571. In 2009, while Brenda was living in New York City (which fluoridates its water), she began
7 to purchase reverse osmosis filters to reduce the amount of fluoride in the family's drinking water. When
8 she can afford it, Brenda has continued to purchase filtering systems and bottled water to limit her family's
9 exposure to fluoride. She has also spent time and money filling expensive and heavy glass carboys at local
10 grocery stores. [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶ 7]

11 572. When Brenda moved to Green Bay, Wisconsin, she did not have the financial means to
12 purchase the filtering systems and bottled water to shield her family from the fluoride that Green Bay adds
13 to its water supply. Brenda was pregnant with her second son, Ko, at this time. [SOURCE: Pls' Ex. 55
14 (Staudenmaier Decl.) ¶ 8]

15 573. It is virtually impossible for Brenda to avoid fluoridated water altogether, despite her efforts
16 to limit fluoride intake at home. She works as a waitress all weekend long at an establishment where the
17 foods and beverages are all made with fluoridated water, and she has not eliminated processed beverages
18 from her diet. [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶¶ 11, 13]

19 574. Brenda has spent money to purchase a fluoride analyzer so she can analyze her own urinary
20 fluoride levels. Despite her efforts to limit that fluoride exposure, her urinary fluoride levels fluctuate as
21 high as 1 mg/L, confirming that she is subject to fluoride exposure, likely through the processed beverages
22 she continues to consume. [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶¶12-14 and Ex. B].

23 575. Plaintiff Brenda Staudenmaier has sustained economic injury in a reasonable attempt to
24 protect her family, particularly her sons, Ko and Hayden from the health risks that are credibly associated
25
26
27
28

1 with fluoride exposure, including ADHD. [SOURCE: Pls' Ex. 55 (Staudenmaier Decl.) ¶¶ 7, 12, 14 &
2 Ex. A & B]

3 **G. EPA Authority and Action**

4 576. Under Section 6 of TSCA, the EPA has the obligation to regulate chemicals that present an
5 unreasonable risk of injury to health or the environment, by, among other actions, prohibiting the
6 “particular use” of a chemical that presents the risk. 15 U.S.C. § 2605 (a).

7 577. A Memorandum of Understanding between the FDA and EPA specifically vests onto EPA
8 the authority “to regulate direct and indirect additives to drinking water as chemical substances and
9 mixtures under TSCA.” [SOURCE: MOU 225-79-2001, available at: [https://www.fda.gov/about-](https://www.fda.gov/about-fda/domestic-mous/mou-225-79-2001)
10 [fda/domestic-mous/mou-225-79-2001](https://www.fda.gov/about-fda/domestic-mous/mou-225-79-2001)]

11 578. EPA’s authority under TSCA thus extends to the fluoridation chemicals added to drinking
12 water. [SOURCE: EPA Ex. 515 (*Petition*) at 515.005]

13 579. EPA has not exercised its authority under the TSCA statute to prohibit or otherwise regulate
14 the introduction of fluoridation chemicals into drinking water supplies.

BENEFITS**

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF CALIFORNIA

FOOD & WATER WATCH, INC., et al.,
Plaintiffs,
v.
UNITED STATES ENVIRONMENTAL
PROTECTION AGENCY, et al.,
Defendants.

Case No. [17-cv-02162-EMC](#)

**FURTHER PRETRIAL CONFERENCE
ORDER**

I. TRIAL DATE AND LENGTH OF TRIAL

A bench trial shall be held beginning on June 8, 2020 at 8:30 AM before Judge Edward M. Chen. In light of the challenges presented by the COVID-19 pandemic, the trial will be conducted via Zoom webinar. The Court notes that the trial will not be livestreamed, but anyone wishing to join the webinar may do so. The Court's license for Zoom webinar will be reserved for 500 people capacity. See Docket No. 181. The parties are reminded that recording court proceedings is prohibited. There shall be a total of up to eight trial days, including June 8; the length of trial is subject to further modification by the Court.

Trial days shall last from 8:30 a.m. to 1:30 p.m. The Court may determine that certain full trial days may be necessary as the trial progresses. Thursdays are dark.

Trial dates are set for June 8, 2020, June 9, 2020, June 10, 2020, June 12, 2020, June 15, 2020, June 16, 2020, June 17, 2020, and June 19, 2020.

The Court has worked closely with the parties to determine the most effective and efficient ways for the parties to present their arguments and evidence in this case, given the circumstances. Pursuant to the Clerk's notice posted on April 24, 2020, the Court has permitted the parties to

submit expert declarations in lieu of some direct testimony. *See* Docket No. 177. Each side is limited to a total of 50,000 words for expert declarations (total per side) to be apportioned between experts as each side sees fit. The expert declarations are to be filed by May 20, 2020; any evidentiary objections thereto are due May 27, 2020. Those objections will be resolved at the hearing on June 5, 2020 (along with any unresolved objections to exhibits and discovery excerpts, as discussed below). Each side is limited to 12 hours of testimony in addition to the expert declarations.

As is discussed in greater detail below, with respect to EPA's Second Motion *in Limine*, the Court has decided to bifurcate the trial such that—if it concludes that an unreasonable risk of harm exists—it will permit the EPA to present evidence related to the deferral of rulemaking at a later stage of the proceeding. If necessary, the Court will address whether to bar the introduction of additional evidence (*i.e.* evidence that has not yet been disclosed to Plaintiffs) on the issue of deferral.

II. STIPULATIONS OF FACT

The parties stipulate to the following facts:

1. According to the United States Centers for Disease Control and Prevention (CDC), as of 2014, approximately 200,000,000 people in the United States live in communities that add fluoridation chemicals to the drinking water.
2. Plaintiffs' Citizen Petition sought to prohibit the addition of fluoridation chemicals to water on the grounds that this condition of use presents an unreasonable risk of neurologic harm.
3. Fluoridation chemicals are added to drinking water to prevent tooth decay (*i.e.*, dental caries). In addition to being added to water, fluoride is added to dental products and certain pesticides.
4. In epidemiology, a cross-sectional study is a comparison of the prevalence of a specific health outcome across levels of a specific exposure in study subjects (or vice versa), with the exposure and outcome both measured at a given time, providing a "snapshot" of the association between the exposure and the health

outcome at one time.

5. In epidemiology, a cohort study is a comparison of incidence rates of a specific health outcome between study subjects with various levels of a specific exposure who are observed over time.
6. A person's individual response to fluoride exposure depends on factors such as age, kidney function, body weight, activity level, nutrition, and other factors.
7. Human urine fluoride concentrations (biomonitoring) measures an internal dose.
8. Various factors can affect the concentration of fluoride in a urine sample, such as an individual's metabolism, when a urine sample is collected, and the time since the last void of the individual who provided the sample.
9. Historically, most studies to investigate the impact of fluoride on IQ in humans have used cross-sectional study designs. Most of these cross-sectional studies have been conducted in China, and other countries with elevated levels (>1.5 mg/L) of naturally occurring fluoride in water. By contrast, fluoride is added to water in the United States to reach a concentration of 0.7 mg/L.
10. Prospective cohort studies have been conducted in Mexico City (ELEMENT cohort), where fluoride is added to salt, and Canada (MIREC cohort), where fluoride is added to water. **These studies are the most methodologically reliable human studies to date on the impact of fluoride on neurodevelopment.**
11. Risk assessment is the process by which scientific judgments are made concerning the potential for toxicity in humans.
12. The National Research Council (NRC, 1983) has defined risk assessment as including the following components: hazard identification, dose-response assessment, exposure assessment, and risk characterization.
13. The term "risk evaluation" is a specialized term under TSCA.
14. Together, the components of EPA's risk assessment process, coupled with the ultimate risk determination, constitute a "risk evaluation" under TSCA.
15. The final step of a risk evaluation is to weigh a variety of factors to determine

whether the chemical substance, under the conditions of use, presents an unreasonable risk of injury to health or the environment, referred to as the “risk determination” step in the TSCA risk-evaluation process.

16. EPA does not require that human exposure levels exceed a known adverse effect level to make an unreasonable risk determination under TSCA. For example, if human exposure levels exceed a known no-adverse effect level divided by combined uncertainty factors, EPA may make an unreasonable risk determination under TSCA.

17. In the ideal world, all risk assessments would be based on a very strong knowledge base (*i.e.*, reliable and complete data on the nature and extent of contamination, fate and transport processes, the magnitude and frequency of human and ecological exposure, and the inherent toxicity of all of the chemicals). However, in real life, information is usually limited on one or more of these key data needed for risk assessment calculations. This means that risk assessors often have to make estimates and use judgment when performing risk calculations, and consequently all risk estimates are uncertain to some degree. For this reason, a key part of all good risk assessments is a fair and open presentation of the uncertainties in the calculations and a characterization of how reliable (or how unreliable) the resulting risk estimates really are.

18. EPA’s *Guidelines for Neurotoxicity Risk Assessment* were designed in 1998 to guide EPA’s evaluation of substances that are suspected to cause neurotoxicity, in line with substantive standards established in the statutes administered by the Agency.

19. EPA’s *Guidelines for Neurotoxicity Risk Assessment* preceded the 2016 TSCA amendments.

20. The current non-enforceable health goal for fluoride under the Safe Drinking Water Act (“SDWA”), or Maximum Contaminant Level Goal (MCLG), of 4.0 mg/L was promulgated in 1985 to protect against a condition known as crippling skeletal

1 fluorosis (*i.e.*, “stage III skeletal fluorosis”). Crippling fluorosis is the final, and
2 most severe, stage of skeletal fluorosis.

3 21. Based on its 2006 review, the National Research Council (NRC) of the National
4 Academies of Science (NAS) recommended that the MCLG of 4 mg/L be lowered
5 to prevent children from developing severe dental fluorosis and reduce the lifetime
6 accumulation of fluoride into bone that the majority of the committee concluded is
7 likely to put individuals at increased risk of bone fracture and possibly skeletal
8 fluorosis.

9 22. Based on the NRC’s recommendation, in 2010, EPA’s Office of Water completed a
10 dose-response analysis using available data between 2000 and 2010 to calculate a
11 reference dose (“RfD”)—an estimate of the fluoride dose protective against severe
12 dental fluorosis, stage II skeletal fluorosis, and increased risk of bone fractures—of
13 0.08 milligrams per kilograms per day (mg/kg/day), a measure of daily intake by
14 body weight.

15 23. In addition to the tooth and bone effects, the NRC also evaluated neurotoxicity as
16 an effect of fluoride exposure, among other health effects. The NRC concluded
17 that the available data were inadequate to demonstrate a risk for neurotoxicity at 4.0
18 mg/L and made recommendations for additional research. Since that time,
19 additional research has been conducted and the scientific database for studies that
20 have examined neurotoxicity as an effect of fluoride exposure has grown.

21 24. In determining whether adding fluoridation chemicals to drinking water presents an
22 unreasonable risk of neurotoxic effects under TSCA, EPA’s Office of Pollution
23 Prevention and Toxics would not rely on the 2010 RfD, but would instead apply a
24 weight of the scientific evidence approach for identifying and characterizing the
25 best available science from the most up-to-date scientific database of studies that
26 have examined neurotoxicity as an effect of fluoride exposure.

27 25. In conducting TSCA risk evaluations, EPA generally uses the Margin-of Exposure
28 (MOE) approach to characterize the risk as a step in the risk assessment process.

Using this approach, an MOE is calculated by comparing (dividing) the point-of departure directly to the expected exposure level. The MOE is then compared to a benchmark MOE, which is the product of all relevant uncertainty factors.

26. EPA considers the MOE, relative to the benchmark MOE, in addition to other factors, in determining whether risks are unreasonable under TSCA.

27. The National Research Council has stated that “the inference that results from animal experiments are applicable to humans is fundamental to toxicologic research.”

28. EPA agrees that effects observed in animals are relevant to humans unless human data counterindicate.

29. The developing brain is distinguished by the absence of a blood-brain barrier. The development of this barrier is a gradual process, beginning in utero and complete at approximately 6 months of age.

30. Fluoride passes through the placenta and gets into the fetal brain.

31. Whether harm would actually occur depends on the dose and nature of exposure.

See Docket No. 150 (“Joint Pretrial Conference Statement”). Furthermore, at the hearing on May 8, 2020, the Court urged the parties to agree to further stipulations, if possible, and the parties indicated that they will endeavor to do so.

III. MOTIONS IN LIMINE

A. Plaintiffs’ Motion in Limine

1. First Motion in Limine to Exclude Evidence of Fluoridation Chemicals’ Alleged Benefits (or Lack Thereof) (Docket No. 144)

Section 21 specifies that determinations of “unreasonable risk of injury to health” must be made “without consideration of costs or other nonrisk factors.” 15 U.S.C. § 2620(b)(4)(B)(ii). The statute does not define “costs” or “nonrisk factors,” and the parties disagree as to whether this applies to the health benefits of fluoridation. Plaintiffs wish to exclude evidence of benefits, while EPA seeks to introduce it. For the reasons outlined below, the Court **GRANTS** Plaintiffs’ First Motion in Limine; the introduction of evidence intended to demonstrate the benefits of fluoride

will not be permitted.

a. Statutory Language, Structure, and Purpose

Plaintiffs contend that “the plain language, structure, purpose, and legislative history of TSCA support the interpretation that benefits are a ‘nonrisk’ factor that cannot be considered as part of an unreasonable risk determination.” Plaintiffs’ First Motion *in Limine* (“First Motion *in Limine* to Exclude Evidence of Fluoridation Chemicals’ Alleged Benefits (or Lack Thereof)”) (hereinafter PMIL 1), Docket No. 144. They believe that benefits should “only be considered during EPA’s rulemaking proceeding,” which follows risk evaluation. *Id.* The plain language, structure, purpose, and legislative history of TSCA are each addressed in turn; the Court then turns to EPA’s promulgated regulation on risk evaluations, as well as the parties’ discussion of the *Framework for Metals Risk Assessment*.

Beginning with the plain language of TSCA, the statute—as noted above—states that the relevant inquiry is whether “the chemical substance or mixture . . . presents an unreasonable risk of injury to health or the environment, *without consideration of costs or other nonrisk factors*.” 15 U.S.C. § 2620(b)(4)(B)(ii) (emphasis added). Plaintiffs contend that “an ordinary plain meaning interpretation is that ‘nonrisk’ is anything that is not a risk” and that “[b]enefits come within this umbrella.” PMIL 1 at 2. For its part, EPA argues that “any plain reading of ‘*unreasonable risk of injury to health*’ would entail some *weighing of health* benefits.” PMIL 1 Opp. at 5–6. The Agency contends that “without a counterbalancing consideration” of benefits “any risk would be unreasonable.” *Id.* While EPA’s phrase “*unreasonable risk*” could imply some amount of weighing of costs and benefits, that is not the only reasonable interpretation. Unreasonable could be a relative measure of risk, *e.g.*, something more than *de minimis*. Moreover, even if the term could imply weighing various factors, it does not dictate *what may be considered* in that weighing process. A weighing process does not inherently require consideration of benefits. TSCA’s broad preclusion of “nonrisk factor” literally encompasses benefits; benefit after all is a nonrisk factor.

EPA advances the argument that health-related benefits are properly considered “risk factors, not nonrisk factors” and are therefore properly considered during risk evaluation. PMIL 1 Opp. at 3. Specifically, EPA asserts:

For chemical substances that provide a health benefit, the absence of those chemical substances may be characterized as a risk to human health. And the presence of those chemicals can be characterized as a risk reduction. In other words, when a chemical has direct biological health benefits, that health benefit can be a risk factor—in effect, the reducing or cancelling out a health risk/hazard—instead of a nonrisk factor (*e.g.*, economic benefits) that can only be considered in risk management.

Id. Because it is “undisputed that fluoride reduces dental caries to some degree,” EPA contends that the health benefits of water fluoridation are properly considered as part of a TSCA risk evaluation. *Id.*¹ One might label this position an “inverse benefits” argument: barring the substance creates a health risk. The trouble with EPA’s contention is that in asserting the existence of the inverse risk, it presumes the absence of the fluoridation if an unreasonable risk is found. However, the rulemaking process does not require that a substance which poses an unreasonable risk be banned outright. It merely triggers a rulemaking process, in which the costs and benefits of the substance are considered in determining how to manage that risk. As a result of that rulemaking, the EPA may choose from a wide range of management tools other than an outright ban, including less expansive restrictions or warning label requirements. That the inverse risk cannot be determined at the “unreasonable risk” juncture (because the ultimate rule will not be determined until the subsequent rulemaking process is completed) undermines EPA’s inverse risk construct.

Turning to the structure of the statute, Plaintiffs focus on two points. First, they contend that “[t]he only places in the statute where the word ‘benefit(s)’ appears are sections that govern the rulemaking phase.” PMIL 1 at 2. In discussing rulemaking, the statute explicitly mentions benefits on three occasions: (1) “In proposing and promulgating a rule . . . the Administrator shall consider and publish a statement based on reasonably available information with respect to . . . the

¹ EPA contends that benefits could properly be considered during the risk characterization process, which could permit evaluation of “the dose-response relationship for both the health benefit and any adverse impacts.” See Defendants’ Trial Brief, Docket No. 154. Alternatively, benefits could be considered during the “risk determination” part of the risk-evaluation process. PMIL 1 Opp. at 3. Risk determination is the final step in the risk evaluation process, during which the EPA “may weigh a variety of factors in determining unreasonable risk.” Procedures for Chemical Risk Evaluation Under the Amended Toxic Substances Control Act, 82 Fed. Reg. 33,726 (July 20, 2017) (codified at 40 C.F.R. pt. 702).

1 **benefits** of the chemical substance or mixture for various uses[,] and [2] the reasonably
 2 ascertainable economic consequences of the rule, including consideration of . . . the costs and
 3 **benefits** of the proposed and final regulatory action,” and (3) “The Administrator may, as part of a
 4 rule promulgated . . . grant an exemption from a requirement . . . for a specific condition of use of
 5 a chemical substance or mixture, if the Administrator finds that . . . the specific condition of use of
 6 the chemical substance or mixture, as compared to reasonably available alternatives, provides a
 7 substantial **benefit** to health, the environment, or public safety.” 15 U.S.C. § 2605(c) and (g)
 8 (emphases added). In contrast to the explicit identification of benefits in Sections 6(c) and 6(g),
 9 the *absence* of any mention of benefits in Section 6(b) (which outlines the risk evaluation
 10 procedures that EPA is to follow) proves benefits should not be considered as part of risk
 11 evaluation procedures under Section 21. PMIL 1 at 2. Section 6(b) identifies a number of other
 12 factors that must be considered by the EPA (*e.g.* “available information on hazards and exposures
 13 for the conditions of use of the chemical substance” and “information on potentially exposed or
 14 susceptible subpopulations identified as relevant by the Administrator”) but does not mention
 15 “benefits”; that section also prohibits EPA from “consider[ing] costs or other nonrisk factors,” as
 16 in Section 21. 15 U.S.C. § 2605(b)(4)(F). Thus, when Congress wanted the EPA to consider
 17 benefits, it so stated. It did not do so in Section 6(b) or Section 21. *See Bates v. United States*,
 18 522 U.S. 23, 29–30 (1997) (quoting *Russello v. United States*, 464 U.S. 16, 23 (1983)) (internal
 19 quotation marks and modification omitted) (“Where Congress includes particular language in one
 20 section of a statute but omits it in another section of the same Act, it is generally presumed that
 21 Congress acts intentionally and purposely in the disparate inclusion or exclusion.”); *see also Pit*
 22 *River Tribe v. Bureau of Land Mgmt.*, 939 F.3d 962, 971 (9th Cir. 2019) (quoting *Barnhart v.*
 23 *Sigmon Coal Co.*, 534 U.S. 438, 452 (2002)) (same text).

24 Turning to statutory purpose, Plaintiffs point to the distinction in TSCA between a
 25 determination that an unreasonable risk exists and any decision about how to manage such a risk
 26 as mentioned above. The bifurcated structure of TSCA strongly suggests that any consideration of
 27 benefits is properly deferred to the risk management (*i.e.* rulemaking) stage. As plaintiffs argue:

28 The requirement that the *determination* of risk precede the

management of the risk serves several purposes, including (1) eliminating the redundancy of performing two separate risk-benefit analyses, and (2) making a clear delineation between the (strictly science-based) determination of *whether there is a risk* and the (policy-influenced) decision of *if and how to manage the risk*. These purposes would be frustrated by requiring risk-benefit analyses in both phases.

PMIL 1 at 3. This construct is perfectly sensible: if the Court determines that an unreasonable risk exists, then the Agency is directed to go through the rulemaking process and at that point takes benefits into account in tailoring a management plan accordingly. This approach also coheres with the statutory text and (as is discussed next) with the legislative history of TSCA.

Finally, Plaintiffs argue that their position is supported by legislative history. *See* PMIL 1 at 3. Specifically, they look to comments submitted by Senate Democratic negotiators intended to clarify “the intent of the negotiators on elements of the final bill text.” 162 Cong. Rec. S3517 (daily ed. June 7, 2016) (statement of S. Democratic negotiators). At the hearing, the parties directed the Court’s attention to the following portion of those comments:

TSCA as in effect before the date of enactment of the Frank R. Lautenberg Chemical Safety for the 21st Century Act authorized EPA to regulate chemical substances if it determined that the chemical substance “presents or will present an unreasonable risk of injury to health or the environment.” In its decision in *Corrosion Proof Fittings vs EPA*, the U.S. Court of Appeals, 5th Circuit overturned EPA’s proposed ban on asbestos, in part because it believed that

In evaluating what is ‘unreasonable,’ the EPA is required to consider the costs of any proposed actions and to ‘carry out this chapter in a reasonable and prudent manner [after considering] the environmental, economic, and social impact of any action.’ 15 U.S.C. § 2601(c).

As the District of Columbia Circuit stated when evaluating similar language governing the Federal Hazardous Substances Act, ‘[t]he requirement that the risk be ‘unreasonable’ necessarily involves a balancing test like that familiar in tort law: The regulation may issue if the severity of the injury that may result from the product, factored by the likelihood of the injury, offsets the harm the regulation itself imposes upon manufacturers and consumers.’ *Forester v. CPSC*, 559 F.2d 774 789 (D.C.Cir. 1977). We have quoted this language approvingly when evaluating other statutes using similar language. *See, e.g., Aqua Slide*, 569 F.2d at

839.

The Frank R Lautenberg Chemical Safety for the 21st Century Act clearly rejects that approach to determining what “unreasonable risk of injury to health or the environment” means, by adding text that directs EPA to determine whether such risks exist “without consideration of costs or other nonrisk factors” and, if they do, to promulgate a rule that ensures “that the chemical substance no longer presents such risk.” In this manner, Congress has ensured that when EPA evaluates a chemical to determine whether it poses an unreasonable risk to health or the environment and regulates the chemical if it does, the Agency may not apply the sort of “balancing test” described above.

162 Cong. Rec. S3516 (daily ed. June 7, 2016) (statement of S. Democratic negotiators). This statement strongly suggests an intention to move away from a free ranging “balancing test.”

In their briefing, Plaintiffs also highlight the portion of the negotiators’ statement that “addressed a question that arose regarding how EPA is to carry out its responsibilities under Section 6(c)(2)” (which governs rulemaking). *Id.* at 3–4. Section 6(c)(2) lays out four factors that the Administrator must consider and address in a published statement when proposing and promulgating a rule under TSCA. *See* 15 U.S.C. § 2605(c)(2)(A). The pertinent portion of the negotiators’ statement notes:

Senate Democratic negotiators clarify that sections 6(c)(2)(A)(i) [“the effects of the chemical substance or mixture on health and the magnitude of the exposure of human beings to the chemical substance or mixture”] and (ii) [“the effects of the chemical substance or mixture on the environment and the magnitude of the exposure of the environment to such substance or mixture”] do not require EPA to conduct a second risk evaluation-like analysis to identify the specified information, but rather, can satisfy these requirements on the basis of the conclusions regarding the chemical's health and environmental effects and exposures in the risk evaluation itself.

162 Cong. Rec. S3517 (daily ed. June 7, 2016) (statement of S. Democratic negotiators). As Plaintiffs note, the Senate report “makes no mention” of EPA relying on risk evaluation findings for evidence related to 6(c)(2)(A)(iii) and (iv), which pertain to the “the benefits of the chemical substance” and the “economic consequences of the rule, including . . . the costs and benefits of the proposed and final regulatory action.” *See* PMIL 1 at 4. Here, too, the omission of the benefits-related factors suggests that the Senate had an “understanding that the issue of benefits w[ould]

not be raised during the risk evaluation” process. *Id.*

Taking all of this together, the plain text of the statute, the structure of the statute, and its legislative history all indicate that consideration of benefits at the risk evaluation stage is inappropriate.

b. Agency Interpretation

Plaintiffs contend that EPA’s own regulation relating to risk evaluation also supports the exclusion of benefits evidence at the risk evaluation stage. As required by Section 6(b)(4) of TSCA, EPA promulgated a rule “that establishes a process for conducting risk evaluations to determine whether a chemical substance presents an unreasonable risk of injury to health or the environment, without consideration of costs or other non-risk factors.” Procedures for Chemical Risk Evaluation Under the Amended Toxic Substances Control Act, 82 Fed. Reg. 33,726 (July 20, 2017) (codified at 40 C.F.R. pt. 702) (hereinafter “Final Rule”). The Final Rule included factors that EPA would consider in conducting risk evaluations, but it does not explicitly mention benefits. In relevant part, the Rule states:

To make a risk determination, EPA may weigh a variety of factors in determining unreasonable risk. The Administrator will consider relevant factors including, but not limited to: The effects of the chemical substance on health and human exposure to such substance under the conditions of use (including cancer and non-cancer risks); the effects of the chemical substance on the environment and environmental exposure under the conditions of use; the population exposed (including any susceptible populations), the severity of hazard (the nature of the hazard, the irreversibility of hazard), and uncertainties.

Id. Here, too, the factors to be considered explicitly include the (risk-related) factors noted in Section 6(c)(2)(A)(i) and (ii) of the statute but do *not* mention the benefit-related factors in Section 6(c)(2)(A)(iii) and (iv). While the Court acknowledges that the Rule does put a great deal of emphasis on flexibility, *see id.* (“the Agency did not think it was appropriate to define ‘unreasonable risk’ because each risk evaluation will be unique”; “This is not intended as an exhaustive list, but merely identifies some of the considerations that are likely to be among the most commonly used.”; “To make a risk determination, EPA may weigh a variety of factors in determining unreasonable risk.”), that general orientation toward customization does not overcome

1 the fact that the rule enumerated certain factors obviously considered to be important in
2 conducting risk evaluations and, in doing so, did not mention benefits.²

3 The parties also address whether the *Framework for Metals Risk Assessment* (authored by
4 the Office of the Science Advisor) (“*Framework*”) compels consideration of the benefits
5 associated with water fluoridation. In relevant part, Section 6 of TSCA states:

6 In identifying priorities for risk evaluation and conducting risk
7 evaluations of metals and metal compounds, the Administrator shall
8 use the Framework for Metals Risk Assessment of the Office of the
9 Science Advisor, Risk Assessment Forum, and dated March 2007,
or a successor document that addresses metals risk assessment and is
peer reviewed by the Science Advisory Board.

10 15 U.S.C. § 2605(b)(2)(E). Although the *Framework* directs that the essentiality of a metal to
11 health be considered, the statute specifically makes the *Framework* relevant to risk evaluations of
12 “metals and metal compounds,” and fluoride is neither a metal nor a metal compound. The
13 *Framework* is therefore irrelevant unless reference to the *Framework* was intended to convey a
14 broader mode of analysis applicable to non-metals.

15 The Court concludes it does not. “Where Congress includes particular language in one
16 section of a statute but omits it in another section of the same Act, it is generally presumed that
17 Congress acts intentionally and purposely in the disparate inclusion or exclusion.” *Bates*, 522
18 U.S. at 29–30 (quoting *Russell*, 464 U.S. at 23) (internal quotation marks and modification
19 omitted); *see also Pit River Tribe*, 939 F.3d at 971 (quoting *Barnhart*, 534 U.S. at 452). Thus, had
20 Congress intended to apply the *Framework* to other portions of TSCA, it knew how to do so;
21 instead, the fact that it did not mention the *Framework* in any other provisions suggests that it
22 intended the *Framework* to apply narrowly, and prescriptively only to metals.

23 Moreover, even if the *Framework* mode of analysis were applied to non-metals like
24 fluoride, the *Framework* only examines whether a substance is essential for—rather than merely
25

26 ² Notably, the EPA’s own website includes a page entitled *How EPA Evaluates the Safety of*
27 *Existing Chemicals*, which states: “TSCA prohibits EPA from considering non-risk factors (e.g.,
28 costs/benefits) during risk evaluation.” *How EPA Evaluates the Safety of Existing Chemicals*,
U.S. ENVTL. PROT. AGENCY, <https://www.epa.gov/assessing-and-managing-chemicals-under-tsc/how-epa-evaluates-safety-existing-chemicals> (last visited May 11, 2020).

beneficial to—human health. As Plaintiffs contend, under the *Framework*, “only ‘essentiality’ can be considered in risk assessment, not mere benefit.” PMIL 1 at 5. The *Framework for Metals Risk Assessment* distinguishes between metals that are essential and those which are merely beneficial: “Metals that are currently deemed nutritionally essential for humans are Co, Cr III, Cu, Fe, Mg, Mn, Mo, Se and Zn (Table 4-1). Some metals (e.g., B, Ni, Si, V, and perhaps As), while not essential to human health, may have some beneficial effects at low levels of exposure (NAS/IOM, 2003),” but those non-essential benefits are not considered under the *Framework*. *Framework for Metals Risk Assessment* at 4-16; *see also* Table 6-3. The *Framework* does not employ a general cost/benefit analysis.³

c. Conclusion

Accordingly, the Court **GRANTS** Plaintiffs’ First Motion *in Limine*. However, the Court notes that it will still permit EPA to challenge Plaintiffs’ experts on the topic of benefits, to the extent those experts wrote extensively about benefits in their expert reports for the limited purpose of challenging the credibility of these expert reports. However, since this is a collateral matter, any such inquiry will be limited.

2. Second Motion *in Limine* to Exclude Any Evidence in Support of a Deferral of Rulemaking Under 15 U.S.C. § 2620(b)(4)(B)(ii) (Docket No. 145)

In the event that the Court finds that fluoridation chemicals pose an unreasonable risk of injury to health, the Court must “order the Administrator to initiate the action requested by the petitioner.” 15 U.S.C. § 2620(b)(4)(B). However, Section 21 of TSCA contains a provision that affords the Court some leeway in ordering that action. Specifically, Section 21 enables to the Court to “permit the Administrator to defer initiating the action requested by the petitioner until such time as the court prescribes” if it finds “[1] that the extent of the risk to health or the

³ The EPA concedes that fluoride is not an essential substance. In his deposition, Edward Ohanian (EPA’s 30(b)(6) representative) was asked: “I understand you believe there’s a benefit to ingesting fluoride, but EPA recognizes that fluoride is not an essential nutrient, correct?” To which he answered: “That’s right.” *See* Exhibit 3 (Deposition of Edward Ohanian) to Plaintiff’s First Motion *in Limine*, Docket No. 144. EPA’s assertion that “fluoride is essential to the prevention of dental caries” does not establish that fluoride is “an essential nutrient” in the way that term is used in the *Framework*.

the Court **OVERRULES** EPA's objection.

This order disposes of Docket Nos. 139, 140, 141, 142, 143, 144, 145, and 150-1.

IT IS SO ORDERED.

Dated: May 19, 2020

EDWARD M. CHEN
United States District Judge

Appendix E
**DR. LINDA BIRNBAUM'S STATEMENT ON
THE NTP REPORT**

Op-ed: It is time to protect kids' developing brains from fluoride

Mounting evidence suggests fluoride may be hampering brain development and reducing kids' IQ. The US needs to rethink this exposure for pregnant women and children.

Bruce Lanphear, Christine Till and Linda S. Birnbaum

The debate on the fluoridation of drinking water—one of the most polarized, long-running, and high-decibel controversies in public health—has been reignited as new studies find that fluoride is toxic to the developing brain.

Last week, the U.S. National Toxicology Program (NTP) released a systematic review of all published studies evaluating the potential neurotoxicity of fluoride; the benefits of fluoride with respect to reducing tooth decay were not addressed. A committee of the National Academy of Science, Medicine, and Engineering will review it this fall. This comprehensive report scrutinized hundreds of human and animal studies on the impact of fluoride on brain and cognitive function. Most, but not all, of the high-quality studies evaluated fluoride concentrations that were about twice the level added to drinking water or higher. However, when considering all the evidence, their conclusion was "fluoride is presumed to be a cognitive developmental hazard to humans."

The NTP's conclusion was strengthened by a synthesis of high-quality studies showing that children who were exposed to higher amounts of fluoride during early brain development scored about 3 to 7 points lower on their IQ tests.

Their conclusion is consequential; about 75 percent of Americans on community water systems have fluoride in their tap water. Water is the main source of fluoride for people who live in communities with water fluoridation.

When do we know enough to revise long-held beliefs? We are reminded of the discovery of neurotoxic effects of lead that led to the successful banning of lead in gasoline and paint. Despite early warnings of lead toxicity, regulatory actions to reduce childhood lead exposures were not taken until decades of research had elapsed and millions more children were poisoned.

We know that the developing brain is exquisitely sensitive to minute concentrations of lead and other toxic chemicals. Moreover, toxic chemicals' irreversible effects on children's rapidly growing brains emphasize the need for prevention.

Failing to act on accumulated evidence raises deep and unsettling questions.

Why are beliefs about the safety of fluoride so intransigent in the face of consistent evidence to the contrary?

Costs outweigh benefits

Fluoride offers no benefits to the fetus and infant and – as shown in the video below – new evidence suggests that fluoride is toxic to the developing brain at levels routinely found in the general population.

The benefits of fluoride in the prevention of tooth decay are predominately topical, occurring only after teeth appear in the child's mouth. Fortunately, pregnant women can use fluoridated toothpaste and, if they

want to do more to prevent cavities, they can limit their consumption of sugar, a leading cause of tooth decay.

The loss of a single IQ point for an individual child is imperceptible, but the societal cost of millions of children losing 5 IQ points, or more is enormous. A decrement of even one IQ point translates to a 2 percent reduction in lifetime economic productivity (roughly \$20,000), not to mention the additional educational costs required for children with lower IQs.

Many health and dental organizations in North America recommend community water fluoridation. Given the weight of evidence that fluoride is toxic to the developing brain, it is time for health organizations and regulatory bodies to review their recommendations and regulations to ensure they protect pregnant women and their children.

We can act now by recommending that pregnant women and infants reduce their fluoride intake.

Specialized water filtration systems can be used to remove fluoride from tap water for pregnant women and infants fed formula. Pregnant women can also avoid black tea, which hyper-accumulates fluoride. The good news for all women is that there is little fluoride in breast milk. Bottled water typically contains lower amounts of fluoride than fluoridated tap water.

Some health advocates are going a step further. In 2016, a group of citizens petitioned the U.S. Environmental Protection Agency (EPA) to stop adding fluoride to drinking water because it is toxic. The EPA rejected the petition. In response, the citizen's group took an unprecedented step and sued the EPA in federal court. EPA lawyers argued half-heartedly that the science was insufficient and said the Agency does not have the resources to regulate fluoride under the Toxic Substances Control Act (TSCA).

In August, Judge Edward Chen of the Ninth Circuit deferred his ruling on whether fluoridation poses an unreasonable risk until the NTP released their report.

New evidence questions existing policies about the safety of fluoride for babies' developing brains. Given that safe alternatives are available and that there is no benefit of fluoride to babies' teeth before they erupt or appear, it is time to protect those who are most vulnerable.

SAFETY DATA SHEET

Version 5

1. Identification of the Substance / Preparation and of the Company / Undertaking

Product Name Hydrofluosilicic Acid
Product Code 1100
UN/ID No UN1778
Recommended Use Industrial, Manufacturing or Laboratory use.
Restrictions on Use None known

Manufacturer

Hawkins, Inc., 2381 Rosegate, Roseville, MN 55113 (612-331-6910)

Emergency Telephone:

CHEMTREC (US): 1-800-424-9300

2. Hazards Identification

GHS - Classification

Acute toxicity - Oral	Category 4
Acute toxicity - Dermal	Category 3
Acute toxicity - Inhalation (Dusts/Mists)	Category 4
Skin corrosion/irritation	Category 1 Sub-category B
Serious eye damage/eye irritation	Category 1
Corrosive to metals	Category 1

Hazards not otherwise classified (HNOC)

Not applicable

Label elements

Signal Word:

Danger

Hazard Statements:

- Harmful if swallowed or if inhaled
- Toxic in contact with skin
- Causes severe skin burns and eye damage
- May be corrosive to metals

Precautionary Statements:

- Wash face, hands and any exposed skin thoroughly after handling
- Do not eat, drink or smoke when using this product
- Use only outdoors or in a well-ventilated area
- Do not breathe dusts or mists
- Wear protective gloves/protective clothing/eye protection/face protection
- Keep only in original container
- Immediately call a POISON CENTER or doctor/physician
- IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing
- Call a POISON CENTER or doctor if you feel unwell
- IF ON SKIN (or hair): Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower

1100 Hydrofluosilicic Acid

- Wash contaminated clothing before reuse
- IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing
- IF SWALLOWED: Call a POISON CENTER or doctor/physician if you feel unwell
- Rinse mouth
- Do NOT induce vomiting
- Absorb spillage to prevent material damage
- Store locked up
- P406 - Store in corrosion resistant container with a resistant inner liner
- Dispose of contents/ container to an approved waste disposal plant

3. Composition / Information on Ingredients

Chemical name	CAS No.	Weight-%
Fluorosilicic acid	16961-83-4	23-25
Hydrogen fluoride	7664-39-3	<1
Water	7732-18-5	Balance

Any concentration shown as a range is due to batch variation or the exact percentage has been withheld as a trade secret.

4. First Aid Measures

Description of first aid measures

General advice	Show this safety data sheet to the doctor in attendance. Immediate medical attention is required. Hydrofluoric (HF) burns require immediate and specialized first aid and medical treatment. Symptoms may be delayed up to 24 hours depending on the concentration of HF.
Inhalation	Remove to fresh air. If breathing has stopped, give artificial respiration. Get medical attention immediately. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. If breathing is difficult, (trained personnel should) give oxygen. Delayed pulmonary edema may occur. Get immediate medical advice/attention.
Eye contact	Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Keep eye wide open while rinsing. Do not rub affected area. Get immediate medical advice/attention.
Skin contact	Get immediate medical advice/attention. Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes.
Ingestion	Clean mouth with water and drink afterwards plenty of water. Never give anything by mouth to an unconscious person. Do NOT induce vomiting. Get immediate medical advice/attention.
Self-protection of the first aider	Avoid contact with skin, eyes or clothing. Wear personal protective clothing (see section 8). Ensure that medical personnel are aware of the material(s) involved, take precautions to protect themselves and prevent spread of contamination. Avoid direct contact with skin. Use barrier to give mouth-to-mouth resuscitation.

Most important symptoms and effects, both acute and delayed

Symptoms Burning. Coughing and/ or wheezing. Redness. May cause blindness.

Indication of any immediate medical attention and special treatment needed

Note to physicians Product is a corrosive material. Use of gastric lavage or emesis is contraindicated. Possible perforation of stomach or esophagus should be investigated. Do not give chemical antidotes. Asphyxia from glottal edema may occur. Marked decrease in blood pressure may occur with moist rales, frothy sputum, and high pulse pressure.

5. Fire-fighting Measures

Suitable Extinguishing Media	Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.
Large Fire	CAUTION: Use of water spray when fighting fire may be inefficient.
Unsuitable extinguishing media	Do not scatter spilled material with high pressure water streams.

1100 Hydrofluosilicic Acid

Specific hazards arising from the chemical	The product causes burns of eyes, skin and mucous membranes. Thermal decomposition can lead to release of irritating and toxic gases and vapors.
Hazardous combustion products	Hydrogen fluoride. Silicon oxides.
Explosion Data	
Sensitivity to mechanical impact	None.
Sensitivity to static discharge	None.
Special protective equipment for fire-fighters	Firefighters should wear self-contained breathing apparatus and full firefighting turnout gear. Use personal protection equipment.

6. Accidental Release Measures

Personal precautions, protective equipment and emergency procedures

Personal precautions Avoid contact with skin, eyes or clothing. Ensure adequate ventilation. Use personal protective equipment as required. Evacuate personnel to safe areas. Attention! Corrosive material. Keep people away from and upwind of spill/leak.

Other information Refer to protective measures listed in Sections 7 and 8.

Methods and material for containment and cleaning up

Methods for containment Prevent further leakage or spillage if safe to do so.

Methods for cleaning up Dike far ahead of liquid spill for later disposal. Soak up with inert absorbent material (e.g. sand, silica gel, acid binder, universal binder, sawdust). Pick up and transfer to properly labeled containers. Clean contaminated surface thoroughly. After cleaning, flush away traces with water.

7. Handling and Storage

Precautions for safe handling

Advice on safe handling Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin, eyes or clothing. Take off contaminated clothing and wash before reuse. In case of insufficient ventilation, wear suitable respiratory equipment. Handle product only in closed system or provide appropriate exhaust ventilation. Do not eat, drink or smoke when using this product.

Conditions for safe storage, including any incompatibilities

Storage Conditions Keep containers tightly closed in a dry, cool and well-ventilated place. Protect from moisture. Store locked up. Keep out of the reach of children. Store away from other materials. Store in accordance with AWWA B703- Fluorosilicic Acid.

Incompatible materials Alkali. Strong acids. Strong oxidizing agents. Metals. Glass. Stoneware.

8. Exposure Controls / Personal Protection

Control parameters

Exposure Limits The following ingredients are the only ingredients of the product above the cut-off level (or level that contributes to the hazard classification of the mixture) which have an exposure limit applicable in the region for which this safety data sheet is intended or other recommended limit. At this time, the other relevant constituents have no known exposure limits from the sources listed here.

Chemical name	ACGIH TLV	OSHA PEL	NIOSH IDLH
Fluorosilicic acid 16961-83-4	TWA: 2.5 mg/m ³ F	TWA: 2.5 mg/m ³ F (vacated) TWA: 2.5 mg/m ³	IDLH: 250 mg/m ³ F TWA: 2.5 mg/m ³ F
Hydrogen fluoride 7664-39-3	TWA: 0.5 ppm F TWA: 2.5 mg/m ³ F S* Ceiling: 2 ppm F	TWA: 3 ppm F TWA: 2.5 mg/m ³ F (vacated) TWA: 3 ppm F (vacated) TWA: 2.5 mg/m ³ (vacated) STEL: 6 ppm F	IDLH: 30 ppm IDLH: 250 mg/m ³ F Ceiling: 6 ppm 15 min Ceiling: 5 mg/m ³ 15 min TWA: 3 ppm TWA: 2.5 mg/m ³

Appropriate engineering controls

Engineering controls Showers
Eyewash stations

1100 Hydrofluosilicic Acid

Ventilation systems.

Individual protection measures, such as personal protective equipment

Eye/face protection	Face protection shield. Tight sealing safety goggles.
Hand protection	Wear suitable gloves. Impervious gloves.
Skin and body protection	Wear suitable protective clothing. Long sleeved clothing. Chemical resistant apron.
Respiratory protection	No protective equipment is needed under normal use conditions. If exposure limits are exceeded or irritation is experienced, ventilation and evacuation may be required.
Environmental exposure controls	Do not allow into any sewer, on the ground or into any body of water. Prevent product from entering drains.
General hygiene considerations	Wear suitable gloves and eye/face protection. Do not eat, drink or smoke when using this product. Regular cleaning of equipment, work area and clothing is recommended. Avoid contact with skin, eyes or clothing. Remove and wash contaminated clothing and gloves, including the inside, before re-use. Wash hands before breaks and immediately after handling the product. Contaminated work clothing should not be allowed out of the workplace.

9. Physical and Chemical Properties

9.1. Information on basic physical and chemical properties

Physical State:	Liquid	Odor:	Pungent
Appearance:	Clear	Odor Threshold:	No information available
Color:	Colorless to light yellow		

<u>Property</u>	<u>Values</u>	<u>Remarks • Method</u>
pH:		No information available
Salt Out Point:		No information available
Melting Point/Freezing Point:	-16 °C / 4 °F	
Boiling Point/Boiling Range:	106 °C / 223 °F	
Flash Point:		No information available
Evaporation Rate (BuAc=1):		No information available
Flammability (solid, gas)		No information available
Flammability Limits in Air:		No information available
Upper Flammability Limit:		Lower Flammability Limit:
Vapor Pressure (mm Hg):		No information available
Vapor density (Air =1)		No information available
Specific Gravity (H₂O=1):	1.225	
Specific Gravity (2nd value):		
Water Solubility:	Miscible in all proportions in water	
Solubility(ies):		No information available
Partition Coefficient (n-octanol/water)		No information available
Autoignition Temperature:		No information available
Decomposition Temperature:		No information available
Kinematic Viscosity:		No information available
Dynamic Viscosity:		No information available
Oxidizing Properties:	No information available	
Explosive Properties:	No information available	

9.2. Other information

Softening Point:	No information available
Molecular Weight:	144.09
VOC Content(%):	No information available
Liquid Density	No information available
Bulk density	No information available

10. Stability and Reactivity

Reactivity	No information available.
-------------------	---------------------------

1100 Hydrofluosilicic Acid

Chemical stability	Stable under normal conditions.
Possibility of hazardous reactions	None under normal processing.
Conditions to avoid	Exposure to air or moisture over prolonged periods. Reacts dangerously with glass.
Incompatible materials	Alkali. Strong acids. Strong oxidizing agents. Metals. Glass. Stoneware.
Hazardous decomposition products	Hydrogen fluoride. Oxides of silica.

11. Toxicological Information

Information on likely routes of exposure

Product Information

Inhalation	Specific test data for the substance or mixture is not available. Corrosive by inhalation. (based on components). Inhalation of corrosive fumes/gases may cause coughing, choking, headache, dizziness, and weakness for several hours. Pulmonary edema may occur with tightness in the chest, shortness of breath, bluish skin, decreased blood pressure, and increased heart rate. Inhaled corrosive substances can lead to a toxic edema of the lungs. Pulmonary edema can be fatal.
Eye contact	Specific test data for the substance or mixture is not available. Causes burns. (based on components). Corrosive to the eyes and may cause severe damage including blindness. Causes serious eye damage. May cause irreversible damage to eyes.
Skin contact	Specific test data for the substance or mixture is not available. Causes severe burns. Toxic in contact with skin. (based on components).
Ingestion	Specific test data for the substance or mixture is not available. Causes burns. (based on components). Ingestion causes burns of the upper digestive and respiratory tracts. May cause severe burning pain in the mouth and stomach with vomiting and diarrhea of dark blood. Blood pressure may decrease. Brownish or yellowish stains may be seen around the mouth. Swelling of the throat may cause shortness of breath and choking. May cause lung damage if swallowed. May be fatal if swallowed and enters airways.

Symptoms related to the physical, chemical and toxicological characteristics

Symptoms Redness. Burning. May cause blindness. Coughing and/ or wheezing.

Numerical measures of toxicity

No information available

Acute Toxicity:

The following values are calculated based on chapter 3.1 of the GHS document .

ATEmix (oral)	387.99 mg/kg
ATEmix (dermal)	375.00 mg/kg
ATEmix (inhalation-dust/mist)	3.76 mg/l

Unknown Acute toxicity 26 % of the mixture consists of ingredient(s) of unknown toxicity

- 0 % of the mixture consists of ingredient(s) of unknown acute oral toxicity
- 25 % of the mixture consists of ingredient(s) of unknown acute dermal toxicity
- 26 % of the mixture consists of ingredient(s) of unknown acute inhalation toxicity (gas)
- 26 % of the mixture consists of ingredient(s) of unknown acute inhalation toxicity (vapor)
- 25 % of the mixture consists of ingredient(s) of unknown acute inhalation toxicity (dust/mist)

Component Information

Chemical name	Oral LD ₅₀ :	Dermal LD ₅₀ :	LC ₅₀ (Lethal Concentration):
Fluorosilicic acid 16961-83-4	= 430 mg/kg (Rat)	-	= 1.11 mg/L (Rat) 1 h
Hydrogen fluoride 7664-39-3	-	-	= 0.79 mg/L (Rat) 1 h
Water 7732-18-5	> 90 mL/kg (Rat)	-	-

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Skin corrosion/irritation Causes severe burns.

Serious eye damage/eye irritation Classification based on data available for ingredients. Causes burns. Risk of serious damage to eyes.

1100 Hydrofluosilicic Acid

Respiratory or skin sensitization No information available.

Germ cell mutagenicity No information available.

Carcinogenicity See section 2 for classified hazards based on component information.

The table below indicates whether each agency has listed any ingredient as a carcinogen.

Chemical name	ACGIH	IARC	NTP	OSHA
Fluorosilicic acid 16961-83-4	-	Group 3	-	-

IARC (International Agency for Research on Cancer)

Group 3 - Not Classifiable as to Carcinogenicity in Humans

Reproductive toxicity No information available.

STOT - single exposure No information available.

STOT - repeated exposure No information available.

Target Organ Effects: Respiratory system, Eyes, Skin.

Other Adverse Effects: No information available.

Aspiration hazard No information available.

12. Ecological Information

Ecotoxicity The environmental impact of this product has not been fully investigated.

Chemical name	Toxicity to algae	Toxicity to fish	Toxicity to microorganisms	Toxicity to daphnia and other aquatic invertebrates
Fluorosilicic acid 16961-83-4	-	65: 96 h Poecilia reticulata mg/L LC50 static 28.7: 96 h Pimephales promelas mg/L LC50 static	-	-
Hydrogen fluoride 7664-39-3	-	-	-	270: 48 h Daphnia species mg/L EC50

Persistence and Degradability: No information available.

Bioaccumulation: There is no data for this product.

Chemical name	Partition Coefficient:
Hydrogen fluoride 7664-39-3	-1.4

Other Adverse Effects: No information available.

13. Disposal Considerations

Waste treatment methods

Waste from residues/unused products Dispose of in accordance with local regulations. Dispose of waste in accordance with environmental legislation.

Contaminated packaging Do not reuse empty containers.

US EPA Waste Number (product as supplied) U134

Chemical name	RCRA	RCRA - Basis for Listing	RCRA - D Series Wastes	RCRA - U Series Wastes
Hydrogen fluoride 7664-39-3	U134	-	-	U134

End of Safety Data Sheet

January 27, 2017

Green Bay City Council
City of Green Bay Protection and Welfare Committee
Green Bay, WI

Dear Committee members:

Delta Dental of Wisconsin is the state's largest private dental insurer. As the dental Science Officer for this company it is my job to monitor the health and treatment needs of all our insured members across the state. Primary prevention, or prevention before a disease is contracted, is paramount in maintaining oral health and reducing the costs associated with treating dental disease. Community water fluoridation is recognized by the dental scientific community as the most effective form of primary prevention for dental decay.

As part of my monitoring of community water fluoridation I have compared the intensity of treatment needs for children and adults living in fluoridated and non-fluoridated communities in Wisconsin. In 2011 the average number of fillings placed in adults and children under age 24 were more than 13% lower for individuals residing in fluoridated communities. This represents both a considerable savings in dollars and in disease morbidity.

The effectiveness of water fluoridation is indisputable and the safety has been reaffirmed time and again by organizations such as the American Dental Association, Centers for Disease Control and Prevention, American Academy of Pediatrics, and the Wisconsin Department of Health Services, along with more than 100 major health and medical organizations. As a health professional I ask that you do everything in your power to continue this valuable prevention program for the benefit of all Green Bay residents.

Sincerely,

A handwritten signature in black ink that reads 'Frederick Eichmiller'.

Frederick Eichmiller, DDS
VP & Science Officer

Dear Green Bay Alders,

11/23/2020

As the Executive Director of the Oral Health Partnership, I write to strongly urge you to continue our community's community water fluoridation program, as was done in 2017 by a vote of 10-1. I write to you especially on behalf of the underserved children in Green Bay and beyond whose rate of caries (cavities) would increase dramatically were community water fluoridation to end. Here are some of the **most important updates that easily** helped me understand this issue.

Update! - Community water fluoridation has been recently and often proven to be safe and effective. Even Wisconsin studies show what happens when fluoride is removed (attachments). A study often cited in Edmonton and Calgary by anti-fluoridation activists now shows the same thing - when fluoride is removed, cavities go up: <https://edmontonjournal.com/news/national/fluoridation-puts-edmonton-ahead-of-calgary-in-child-dental-health-study-finds>

Update! - 108 times anti-fluoride activists have brought their issues to court, and 108 times they have failed! They now have their 109th issue that is only pending further research. Additionally, no one has sued for drinking fluoride. No civil or criminal lawsuits about fluoride, ever. Unlike lead, mercury, etc., fluoride is safe and no attorney will take on case with lack of valid proof it is at all harmful.

Update! - Anti-fluoride activists argue fluoride is forced medication, which the EPA and others do not support as fluoride occurs naturally in water. But is fluoride forced medication? Perhaps in the same that vaccinations are a public health necessity - treating polio, smallpox, rabies with vaccines that are required of the public and also health breakthroughs.

Update! - Be aware that almost all of the "studies" referenced by the anti-fluoride group are misquoted and not properly represented. Furthermore, almost all of the studies referenced were debunked and discredited by the EPA in 2017! (<https://www.epa.gov/dwsixyearreview/review-fluoride-drinking-water-regulation>).

Update! - Anti-Fluoride activists engage in intimidation and other reprehensible behavior in Green Bay and around the U.S. They have repeatedly filed complaints against the licenses of professionals who support community water fluoridation and repeatedly sent letters threatening the jobs of others simply because people disagree. This is awful.

Update! - Recent peer-reviewed studies agree with many past studies - fluoride is both 100% safe and effective at reducing decay. Please review the vast preponderance of community water fluoridation literature, much of it recent, further below.

Update! - Anti-fluoride activists reference a recent NTP study often and say it shows cognitive decline linked to fluoride. That study is new and already being challenged by numerous groups about its methodology and conclusions. Please see further below to read further into the NTP study.

Update! - All four municipalities that buy Green Bay's water want it to remain fluoridated. The Brown County Board of Public Health voted unanimously to keep community water fluoridation, as did other groups. All major health organizations state-wide and nationally support community water fluoridation.

Thank you for paying attention to all that is happening here.

Michael Schwartz
Executive Director
Oral Health Partnership

Here is further information about the NTP study:

<https://cadth.ca/sites/default/files/pdf/htis/2019/RC1198%20Community%20Water%20Fluoridation%20Exposure%20Final.pdf>

The NTP literature search has included many papers published in non-peer reviewed journals and papers in Chinese but failed properly to consider methodologically stronger publications that do not support the NTP monograph's conclusions. These conclusions would change if the committee takes into account the following publications.

A study out of Sweden involves multiple measures of a range of cognitive outcomes for tens and hundreds of thousands of Swedish children and young adults, including covariates and fixed effects, and is more policy relevant.

Had fluoride in drinking water had even the slightest adverse effect on cognitive function, this study would have found it.

The article has been peer reviewed by the most prestigious economic journal in the world, the Journal of Political Economy, and accepted for publication.

<https://www.journals.uchicago.edu/doi/abs/10.1086/711915>

Linuz Aggeborn and Mattias Öhman (2020) analyzed data from Sweden and concluded that:

- a. "We reconfirm the long-established positive effect of fluoride on dental health."
- b. **"We estimate a zero-effect on cognitive ability** – in contrast to several recent epidemiological studies."
- c. "Fluoride is found to increase labor income. This effect is foremost driven by individuals from a lower socioeconomic background."

Broadbent et al 2015 is a methodologically strong cohort study from New Zealand (based on the renowned Dunedin Birth Cohort Study) that **found no association between exposure to water fluoridation and later measures of IQ and cognitive performance**. Authors considered many possible confounders, including fluoride tablets, fluoride toothpaste, geographic location, socioeconomic status, breastfeeding etc. (probably more than any other study has done), but none made any difference to their findings of no association between water fluoridation and IQ. **It's also worth noting that the Broadbent study collected people's IQ scores multiple times over a 30-year period, enhancing the reliability of the data.**

Broadbent JM, Thomson WM, Ramrakha S, Moffitt TE, Zeng J, Foster Page LA, Poulton R. 2015. Community water fluoridation and intelligence: prospective study in New Zealand. Am J Public Health:105(1):72-6

Controlled fluoridation: the dental effects of discontinuation in Antigo, Wisconsin

Charles W. Lemke, MS, MPH

Joseph M. Doherty, DDS, MPH

Michael C. Arra, DDS, MPH, Madison, Wis

A dental survey of schoolchildren was made in Antigo shortly before controlled fluoridation was discontinued. DMF rates were comparable to those of other fluoridated areas in the state. Four years after fluoridation was discontinued, and again, just after it was reinstituted, additional surveys were made. DMF rates had greatly increased and were characteristic of rates found in nonfluoridated areas in the state.

Fluoridation of the water supply of the city of Antigo, Wisconsin, began in June 1949 and ended in November 1960. The actions of a militant antifluoridation group brought about its discontinuance.

A dental examination of children in kindergarten, second, fourth, and sixth grades in both public and parochial schools was made in 1960, but an immediate local comparison was not possible since no prefluoridation survey was made in 1949. However, the def/DMF rates compared favorably with those of other fluoridated areas in Wisconsin.¹ The 1960 examination and the interruption of fluoridation provided a unique opportunity to document decay rates as they occurred after withdrawal of fluorides from the public water supply.

A survey of dental conditions of children en-

rolled in the kindergarten, second, and fourth grades of the city school systems, both public and parochial, was made in December 1964, four years after fluoridation stopped. The results of this survey showed a definite regression from the excellent dental conditions found in 1960 to the higher rates of dental decay found in nonfluoridated areas of Wisconsin.¹ When the results were released locally, a resurgence of activity took place among profluoridationists. A referendum was held and fluoride was again added to the public water supply beginning in October 1965.

A third survey of dental conditions was made in May 1966, at which time all Antigo elementary school children were examined. Because decay is almost irreversible once it has occurred, this last examination is an accurate reflection of the condition of teeth 4½ years after the discontinuance of fluoridation.

The purpose of this report is to summarize the results of the examinations made in Antigo in 1960, 1964, and 1966 to show the regression from excellent to poor dental conditions that occurred after the removal of adequate fluorides from the public water supply.

Procedure

The procedures used in the three examinations summarized in this report were intended to produce information that could be compared. All three examinations were conducted by personnel of the dental health section of the Wisconsin Division of Health. Mouth mirrors and explorers

with portable dental lights for illumination were used.

All children in the grades studied were given resident-history questionnaires for their parents to complete. Only those children who brought back completed resident-history forms signed by their parents were examined. Cooperation was excellent; approximately 91% of the enrollment participated in the examinations.

Findings

Results of the December 1964 survey have already received wide publicity. Children in kindergarten showed a 92% increase in the def rate, and children in the second and fourth grades showed 183% and 41% increases, respectively, in DMF rates as compared with the 1960 survey. The number of caries-free children showed decreases of 49% for the kindergarten children, 46% for the second graders, and 25% for the fourth graders.

Examination of the 1964 data indicated that a more detailed survey would produce information of further value. It was decided that a follow-up examination on a broader scale should be made approximately two years from the date of the 1964 survey. The survey was actually completed a year and a half after the 1964 survey. The timing was dictated in part by the speed with which fluoridation was reinstated in the city when the fact of an increasing decay rate was demonstrated by the 1964 survey.

Table 1 summarizes changes occurring in the def/DMF counts from the cessation of fluoridation in 1960 to its reinstatement in 1965. Table 2 presents the same information for caries-free children. The results as reported are for resident children only, that is, children whose use of the local water was continuous except for periods not exceeding 90 days in any one calendar year. The deciduous teeth or def count is recorded for the kindergarten children, and the permanent dentition or DMF count is recorded for the second, fourth, and sixth grade children.

The findings of the 1966 survey, when compared with the 1964 findings, showed a further increase in the def/DMF count and a comparable decrease in the caries-free children. Children in the kindergarten showed a 112% increase in def rates and children in the second, fourth, and sixth grades showed DMF increases of 70.5% and 91.6% respectively. The decrease in caries-free kindergarten children from 1960 to 1966 was 53% (Table 3)

Table 1 ■ Dental caries experience in deciduous teeth of kindergarten children in Antigo, Wis, 1960, 1964, 1966.

Year	No. Exam.	No. of Teeth	Total def	Mean def	% Increase from 1960	
1960	125	223	12	80	315	2.5
1964	131	509	30	87	626	4.8
1966	103	425	33	93	551	5.3

whereas the second, fourth, and sixth grade results showed 67%, 67%, and 63% decreases, respectively, in caries-free children (Table 4).

Chi-square values were calculated for differences in proportion of children with no caries in 1960 versus 1966. Four such 2×2 contingency tables are possible and the chi-square values calculated were found to be highly significant. In fact, such values would be exceeded by chance alone far less than once in 200 trials. The actual chi-square values were 11.582 for kindergarten children from October 1960 to May 1966, 52.290 for second graders, 15.116 for fourth graders, and 7.799 for sixth graders. A value of 7.88 is expected to occur by chance only once in approximately 200 trials.

All the children examined in the three surveys experienced varying exposure times to fluoride. The average-age 1960 kindergarten children were exposed to fluoride throughout the life cycle of the deciduous dentition up to the time of the examination. The 1964 kindergarten children received fluoride throughout the deciduous developmental cycle up to the eruption period but received no fluoride after that. The average 1966 kindergarten children, on the other hand, received fluoride only during the prenatal period and the first six months of postnatal development.

The 1960 second-grade children received fluoride throughout the entire life cycle of the permanent teeth present at the time of the examination.

Table 2 ■ Dental caries experience in the permanent teeth of children in the second, fourth, and sixth grades, Antigo, Wis, 1960, 1964, 1966.

Year	No. Exam.	No. of D	Teeth M	F	Total DMF	Mean DMF	% Increase from 1960
Second grade children							
1960	143	52	1	37	90	0.6	...
1964	109	133	0	52	185	1.7	183
1966	94	125	1	68	194	2.0	233
Fourth grade children							
1960	137	67	1	158	228	1.7	...
1964	130	156	2	155	313	2.4	41
1966	86	157	1	97	255	2.9	70
Sixth grade children							
1960	123	68	3	224	295	2.4	...
1966	85	148	1	243	392	4.6	91

Table 3 ■ Caries-free experience in the deciduous teeth of kindergarten children in Antigo, Wis, 1960, 1964, 1966.

Year	No. Exam.	Caries-free No.	%	% Decrease from 1960
1960	125	49	39.0	...
1964	131	26	19.8	49
1966	103	19	18.4	53

The average 1964 second-grade child had received fluoride up to the age of 5 and the average 1966 second-grade child had received it up to approximately the age of 3. The average 1960 fourth-grade child received fluoride up to the age of 11 whereas the average 1964 and 1966 fourth-grade child received it up to the ages of 7 and 5 respectively. The average 1960 sixth-grade child received fluoride up to the age of 13 and the average 1966 sixth-grade child up to the age of 7.

The illustration shows fluoride exposure time for the children examined in the 1966 survey. The upper line represents children of kindergarten age at the time of the May 1966 examination. On the average, they were born in mid-1960, just before the cessation of fluoridation in November. Consequently, the average kindergarten child received fluoridated water for only the first six months post-natally. The oldest children received it for nearly a full year. The youngest received it for a month or less. All of them received it during the prenatal period. The average fourth-grade child is represented by the 10-year and the sixth-grade child by the 12-year age line.

Discussion

If fluorides are indeed responsible for a reduction in dental decay, then removal of fluorides should

Table 4 ■ Caries-free experience in the permanent teeth of children in second, fourth, and sixth grades, Antigo, Wis, 1960, 1964, 1966.

1966	85	8	9.4	63

result in a regression to the original poor dental condition. This phenomenon is not well documented in a controlled fluoride situation. It could only be apparent in a case such as this where fluoridation has been in effect long enough to provide "year classes" or "age groups" with ample fluoride exposure throughout the major part of the period when teeth are developing, or erupting, or both.

To the best knowledge of the authors, there are only two previous reports that deal with the dental results of the removal of fluorides from a public water supply—the first, by Jordan,² deals with a controlled situation in 1962; the second, by Way,³ deals with a natural fluoride removal in 1964. A third report by Russell^{4,5} in 1949 deals with a somewhat analogous situation in which the children studied had moved to a low-fluoride area after varying periods of exposure to natural fluoride of 1.0 ppm or more.

Jordan's study, conducted in Austin, Minnesota, provides information on decay occurrence annually from 1952, when fluoridation began, through 1959. The fluoride level maintained from 1952 through 1956 was 1.2 ppm. Fluoridation was discontinued in 1956, after four years. The study showed a progressive decrease in the DMF rates from 1952 to a low point in 1956 and 1957. Rates from 1958 and 1959 began to show an increase. Jordan concluded that the "trend now indicates the decay rate may return to its original rate of 1952."

In May 1959 Galesburg, Illinois, after 40 years of using deep-well water which contained 2.0 ppm of natural fluoride, changed its source to the Mississippi River which contains 0.0 to 0.1 ppm of fluoride. In October 1961 the community adjusted the fluoride content of their water supply to 1.0 ppm. Thus, Galesburg was without adequate fluoride in their water supply for approximately two years and four months. Examination of children aged 6, 10, and 14 years in 1958 and again in 1961 showed substantial increases in DMF counts with as short an interruption as two years and four months. Way concluded, "to maintain the limited immunity that existed while ingesting the fluoridated communal water, the continued use of fluorides was essential for children of all age groups."

In a series of articles in 1948, Russell^{4,5} reported on the dental conditions of 2,140 children of Mitchell, South Dakota. He observed that 397 continuous-resident children between the ages of 11 and 15 had been exposed to a mean level of 1.15 ppm fluoride for ten months sometime before the eruption of their first permanent molars. No

History of fluoride exposure of children age 6 through 13 from 1950 to 1966 in Antigo, Wisconsin.

caries-inhibitory effect could be demonstrated about ten years after Mitchell reverted to a low-fluoride water level.

Russell was further able to identify 297 migrant children who had consumed water with a fluoride concentration of 1.0 ppm or more through some definite age span of at least one year's duration. He was able to put children into three groups: those who had received their fluoride exposure before the age of 6, that is, before the eruption of their first permanent molars and incisors; those who had been exposed both before and after the age of 6; and a few children who had been exposed only after the first permanent molars and incisors had been fully exposed.

He drew the following conclusions⁵ from his findings:

- Those children who had been exposed to fluoride before the eruption of the first permanent molars showed only a transient inhibition of dental caries in teeth they still had at age 10. This inhibition was eventually lost, however, by age 14 to 16.

- Caries inhibitory effects persisted through age 14 to 16 in those children whose fluoride ex-

posure continued after the time of eruption of the first permanent molars.

- In migrant children 13 to 17 years old whose fluoride exposure began at birth and continued through the accepted calcification period, there was a definite caries reduction only when the exposure continued for some time after the eruption of the teeth.

Our findings, that is, the increased caries rate after an interruption in fluoridation for 4½ years, support the findings of the Russell, Jordan, and Way studies. The findings, as mentioned by Russell and reported by Jordan, Way, and ourselves, are the direct counterpart of those findings cited by Klein,⁶ who found decided inhibition of dental caries in children whose teeth had calcified in a fluoride-free area and who later, after the teeth had erupted, were exposed to water containing fluoride.

The findings as reported by Klein and others led Russell⁵ to offer the following hypotheses regarding fluorides:

- "Fluorides may be incorporated into tooth enamel either during the process of calcification or after eruption and when so incorporated are effective in the inhibition of dental caries.

■ "This inhibitory effect tends to persist so long as fluoride exposure is continued but tends slowly to be lost after fluoride exposure is discontinued, particularly in teeth highly susceptible to caries; hence,

■ "Periodic or continuous renewal of the fluoride content of tooth enamel is required for maintenance of the maximum caries-inhibitory effect."

Reference to the illustration shows that all kindergarten children reported in this study had received fluoride prenatally. The youngest kindergarten of 1966 received it only prenatally and the oldest received it prenatally and postnatally for a maximum of approximately one year. Under the assumption that prenatal fluorides offer maximum protection to deciduous teeth, the relatively rapid decline of tooth conditions shown in kindergarten children would not be expected. However, the efficacy of prenatal fluorides has been based primarily on assumption rather than scientific fact. A number of studies—Horowitz and Heifetz,⁷ in 1967, Schlesinger,⁸ in 1965, and Carlos⁹ and others in 1962—refute earlier conclusions regarding the benefit of fluoride supplements for pregnant women as far as prevention of decay in the deciduous teeth of their children is concerned. The lack of response to prenatally administered fluorides has led to a Federal Drug Administration¹⁰ ban on prescription drugs containing fluoride for pregnant women. There is no question of the safety of these drugs. They are banned simply because they cannot be shown to produce the effect expected of them.

Summary

Dental examinations made in 1960 in Antigo, Wisconsin, before the removal of fluorides, showed

DMF rates comparable to those characteristic of other fluoridated areas in Wisconsin. Dental examinations made in 1964, four years after fluoridation had stopped, and in 1966, just after fluoridation had been reinstituted, showed that DMF rates had greatly increased and were characteristic of those rates found in nonfluoridated areas in Wisconsin. Findings substantiate previous studies regarding the withdrawal of fluorides from the water supply and the ineffectiveness of fluoride as a prenatal therapeutic measure.

Consequences of community water fluoridation cessation for Medicaid-eligible children and adolescents in Juneau, Alaska

Jennifer Meyer¹, Vasileios Margaritis^{2*}  and Aaron Mendelsohn²

Abstract

Background: The general aim of this research was to determine whether cessation of community water fluoridation (CWF) increased oral health disparities, as measured by dental caries procedures and restoration costs for children and adolescents.

Methods: The analysis was based on all Medicaid dental claims records of 0- to 18-year-old patients residing in zip code 99801 (Juneau, Alaska) during an optimal CWF year (2003, $n = 853$) compared to all claims for the same age group from 2012 ($n = 1052$), five years after cessation of CWF. A bivariate analysis (Mann-Whitney U test) of the mean number of caries procedures performed per client was conducted in the study groups under both independent CWF conditions. Furthermore, logistic regression was performed using the dependent variables of caries procedures and the cost of caries-related procedures, with adjustments for CWF group, gender, and race.

Results: The statistically significant results included a higher mean number of caries-related procedures among 0- to 18-year-old and < 7-year-old patients in the suboptimal CWF group (2.35 vs. 2.02, $p < 0.001$; 2.68 vs. 2.01, $p = 0.004$, respectively). The mean caries-related treatment costs per patient were also significantly higher for all age groups, ranging from a 28 to 111% increase among the suboptimal CWF cohorts after adjusting for inflation. The binary logistic regression analysis results indicated a protective effect of optimal CWF for the 0- to 18-year-old and < 7-year-old age groups (OR = 0.748, 95% CI [0.62, 0.90], $p = 0.002$; OR = 0.699, 95% CI [0.52, 0.95], $p = 0.02$, respectively). Additionally, the age group that underwent the most dental caries procedures and incurred the highest caries treatment costs on average were those born after CWF cessation.

Conclusions: These results expand our understanding of caries epidemiology under CWF cessation conditions and reaffirm that optimal CWF exposure prevents dental decay. These findings can offer fiscal estimates of the cost burden associated with CWF cessation policies and help decision-makers advance oral health, prevent dental caries, and promote equity in oral health outcomes.

Keywords: Dental caries, Water fluoridation, Alaska

Introduction

While the oral health of most Americans has improved over the last century, it remains a significant unmet health care need for children and structurally marginalized groups [1, 2]. Dental caries continues to be the most common chronic childhood disease, and dental pain is the second most common cause of school absences [1, 3, 4].

Importantly, the burden of negative oral health outcomes is disproportionately borne by vulnerable groups, including those least able to advocate for themselves, such as children, members of non-majority ethnic groups and low-income families [5–7].

From the 1930s through the early part of the twenty-first century, the research community has dedicated time and resources toward producing and reviewing comparison studies of fluoridated versus non-fluoridated communities [8]. Investigating potential associations among optimal community water fluoridation

(CWF) and reductions in both pediatric dental caries and adult tooth loss are also important for improving economic, racial, and ethnic disparities in oral health [9–15]. Over the decades, researchers have established a large body of empirical work supporting both the efficacy and safety standards of CWF systems, which are often summarized in major meta reviews [2, 7, 16–19]. In addition to caries prevention, studies have demonstrated the treatment cost savings secondary to CWF. For example, estimates specify that for every \$1 spent on oral health preventative measures, such as CFW, taxpayers can save \$50 in annual treatment costs for each low-income citizen who relies on state and federal subsidies for dental care [3, 16, 20–24].

The U.S. Centers for Disease Control, along with several independent commissions, conclude that CWF is both a safe and cost-effective method for decreasing dental disease and caries among populations, regardless of age or income [3, 11, 18, 19, 21, 25]. Two large meta-reviews with different inclusion parameters noted that much of the evidence regarding CWF is based on mid- to late-twentieth century studies and cautioned about the applicability of the findings to modern conditions with widely available fluoridated toothpaste and advanced dental technologies [18, 19]. In 2010, the U.S. Department of Health and Human Services convened an interagency panel to review all the available evidence regarding CWF and its potential positive and negative health effects [7]. The panel determined that even after the introduction and widespread availability of fluoridated toothpaste, U.S. populations still benefited from CWF as a result of reductions in tooth decay up to 25% [7, 14, 21]. This panel also found that the only negative health effect associated with optimal CWF, even at higher than recommended levels (2–4 ppm), was severe dental fluorosis [7]. Therefore, considering the concerns regarding dental fluorosis, particularly for children whose teeth are still developing, the U.S. Public Health Service issued a new recommendation that community water programs fluoridate the water supply at 0.7 mg/L versus the previous range of 0.7–1.2 mg/L given the multiple sources of fluoride in the modern context and to balance decay prevention benefits while reducing the risk of dental fluorosis [2, 7]. Recent trends toward CWF discontinuation in public water systems represent an opportunity to evaluate caries epidemiology and caries treatment cost variations under suboptimal CWF conditions [26]. Given the relatively new phenomenon of policy change inspired by CWF cessation advocacy groups, the impact on population health after removing exposure to optimal fluoride levels in public water systems remains understudied [27–29].

The epidemiological impact of CWF discontinuation has been analyzed in only a small number of studies,

and the results have been mixed [25–30]. Additionally, whether specific age groups or income levels are more or less at risk for caries development following CWF cessation has not yet been established [25–30]. The first known meta-analysis of CWF cessation reviewed 13 multidisciplinary databases, and the authors noted only 15 research instances in which CWF cessation was the studied intervention [26]. These publications occurred over several decades, from 1956 to 2003, and represented thirteen different countries [26]. Variations among these published works include methodological factors, such as utilization of a comparison group for whom CWF was not ceased, application of a concurrent cross-sectional versus time series approach, and differences in the type of metric utilized – typically full dental records, claims records or open-mouth screening exams (i.e., DMFT scores), and contextual factors, such as the time interval post-cessation, healthcare delivery systems, local socio-economic conditions and consideration of other sources of fluoride in the community (the introduction of fluoride rinse programs, supplements, or available fluoride salts) [26]. This research intends to contribute to the growing CWF cessation evidence base by assessing and quantifying oral health changes secondary to CWF discontinuation among Medicaid-eligible children and adolescents in Juneau, Alaska, using documentation of caries-related procedures from Medicaid dental claims records six years post-CWF cessation.

According to the previous Surgeon General of the United States, as a nation, approximately 75% of the population has access to optimally fluoridated water [31]. The Healthy People 2020 [32] objective on CWF aims to increase that percentage to 79.6% of the population receiving the optimum level of CWF associated with caries prevention (0.7 mg/L or 0.7 ppm) in community water sources. However, the percentage of Alaska's population served by CWF was 65% in 2007 and fell to 49.3% in 2014 as a result of local city officials changing the public water fluoridation policies [33]. City assemblies in both Juneau (2007) and Fairbanks (2011) reversed CWF policies citing a 'lack of evidence' regarding the oral health benefits and risks of CWF [34]. Currently, the oral health impacts of these local water policy decisions on population oral health in Alaska remain unknown.

This research aimed to assess the impacts of these decisions using the following three research objectives. The first objective was to determine the extent to which CWF cessation impacts the frequency of dental caries-related procedures among Medicaid-eligible children and adolescents. The second objective was to determine the extent to which CWF cessation impacts caries severity as measured by caries-related treatment costs among Medicaid-eligible children and adolescents. The third objective was to determine the extent to which

CWF cessation impacts caries development rates for specific age cohorts among Medicaid-eligible children and adolescents. Recent trends toward CWF discontinuation from public water systems represent an opportunity to evaluate caries epidemiology and caries treatment cost variations under suboptimal CWF conditions [26].

Methods

Juneau served as an ideal study population, with 96% of the residents in zip code 99801 serviced by city water [35, 36]. The rugged terrain of Southeast Alaska makes Juneau one of only two U.S. state capitals accessible only by plane or sea. While Juneau lacks connections to major road systems, thus mitigating the risk of confounding from optimal CWF exposure due to in-and-out migration or travel from neighboring counties (also known as the ‘halo’ effect), it maintains all the modern conveniences that one would expect in the third largest Alaskan city – including schools, public transportation, a hospital, multiple clinics and a variety of dental professional offices, as well as the Southeast Alaska Tribal Health Consortium (SEARHC) headquarters. We also note the widespread availability of fluoridated toothpaste before, during, and after the study at retail outlets, as well as the distribution of such toothpaste to patients at dental clinics. The annual residential population characteristics are similar to those that we may observe on an island or in a closed population. For example, the Juneau census reported a population of 31,283 in 2003 and 32,832 in 2012, reflecting a total increase of 1549 over the nine-year period. In other words, a small population increase of 0.006%, or 172 persons, per year occurred during the study period [37, 38].

The target population of this study included children and adolescents between the ages of 0–18 years living in families whose incomes met Medicaid requirements. The eligibility requirements for Alaskans seeking Medicaid includes children up to 18 years old if the family income does not exceed 150–200% of the Federal Poverty Level [39]. Medicaid income limits vary depending on family size. The rationale for this focus was to assess two groups living in the same zip code with similar ages and economic experiences at two points in time, thus mitigating the influence of confounding factors known to influence oral health status, such as parent educational attainment and wide variations in income [40]. Families living in poverty also represent a vulnerable group likely to be affected by CWF cessation policy decisions and the group that is least able to participate in health policy decision-making processes [4, 24, 41]. As the entire study population was sourced from a homogeneous economic group at two different time points, we were able to observe the influences of the independent variable (CWF) on the dependent variables (dental caries

procedures and treatment costs) both before and after CWF cessation.

The retrospective comparative research design provided a method for investigating the main effect of CWF removal from community water systems on pediatric and adolescent oral health using Medicaid dental claims billing records. Data from Medicaid dental claims have been utilized in previous research, and the form is standardized by the American Dental Association to specify demographic indicators, exact procedure codes, reimbursement rates and provider service charges [16, 22, 23, 42]. Data were secured from all Medicaid dental claims records submitted during 2003, three years prior to cessation, and 2012, six years post-cessation, for all Medicaid-eligible children aged 0 to 18 years residing in the 99801 zip code who were examined by a dentist. The State of Alaska Chief Dental Officer confirmed that Juneau had been optimally fluoridated since the early 1980s, noting a ‘fluoride stoppage’ during the last half of 2003 to study pipe corrosion, although documentation of the actual study was not available (Dr. Whistler, personal communication, February 2, 2016). Therefore, the year 2003 was selected to obtain a clean representation of optimal (0.7 mg/L–1.2 mg/L) CWF exposure. Medicaid claims records were not available from the central Medicaid processing center for the period after 2012 for Alaska; therefore, as CWF cessation occurred in January of 2007, 2012 was selected as the comparison year to maximize the number of children in the sample with only suboptimal (< 0.065 mg/L) CWF exposure as measured annually from 2007 through 2012 [35].

Walden University’s Institutional Review Board approved the study (Walden IRB #10–31–16–0075333). Then, the dental claims database was released after approval by the Centers for Medicare and Medicaid Research Unit [43, 44]. Due to high database costs (\$10,500 USD) and study time constraints, only two years of claims were purchased.

The entire study population, including both 2003 and 2012, yielded 1905 patients, exceeding required sample size estimates. All dental claims records for every individual meeting the zip code and age criteria during the study years were reviewed and coded according to study parameters (i.e., Levels 1–4). In 2003, under optimal CWF conditions, the sample size for the 0- to 18-year age group was 853, and in 2012, under suboptimal CWF conditions, the sample included all claims for 1052 patients. Nationally standardized dental code reference material, specifically, Current Dental Terminology (CDT) codes used for procedure and service claim reimbursement, were publicly available for referencing procedure types and costs for both study years. Overall, CDT claims reimbursement rates do not change year to year like Current Procedural Terminology (CPT) codes typically used in medicine.

According to the retired State Dental Chief Dr. Whistler (personal communication August 1, 2018), Medicaid made adjustments in the form of increases for dental claims CDT codes in 2009 and 2010, which may have resulted in Medicaid reimbursement increases even without provision of more services. From 2003 to 2008, the Medicaid dental reimbursement rate would largely have been the same (i.e., remained unchanged). Therefore, since this study spanned 2003 and 2012, provider service fees were the more consistent metric and could also be adjusted for inflation, thus allowing comparisons.

Further variables were developed to accurately address the research objectives. In addition to sorting data into age group cohorts, a variable reflecting the number of caries-related procedures and total costs for caries-related procedures was used. More specifically, all dental procedure codes were organized into four levels. Level 1 represented the type of oral exam (e.g., partial or comprehensive), Level 2 represented preventative care (e.g., x-rays, sealants or fluoride varnish), Level 3 represented caries-related services (e.g., restoration by amalgam, resin, crown, filling under sedation or endodontic/root canal treatments), and Level 4 represented all other services, such as extractions and surgeries. While some Level 4 procedures were likely caries-related, such as extractions, we were not able to confirm this assumption by CDT codes alone as they lack diagnostic details. Therefore, to maximize precision regarding decay without a full medical record, the claims for extractions and outpatient surgeries were not included in the analysis.

The study objectives required analysis of the Level 3 category of procedure claims. We manually counted the number of caries-related claims (Level 3 claims) and the total dollar amount charged by the service provider for these restorative treatments. For example, if a patient had a one-surface primary amalgam restoration and a three-surface anterior resin restoration during the study year, then this patient's experience would be summed as two caries-related procedures, along with the total caries-related costs for these specific procedures.

Descriptive statistics were calculated in SPSS for the independent variable of CWF and the dependent variables of dental caries procedures and dental caries-related costs, followed by adjustments for gender and race. Adjustments for income and parental educational attainment were not applied since the entire sample included only low-income participants whose family incomes met the criteria for Medicaid eligibility. Parent education was not a variable in the database, but it is assumed to be similar between the two study years since the child or adolescent was receiving Medicaid benefits. Qualification for Medicaid was and remains based on income level and varies by family size, disability status, and other metrics. For example, in 2003, the poverty level for a family

of three in Alaska was defined as an annual income of \$15,140, and in 2012, the income level was \$23,870 [45, 46]. Medicaid expansion in Alaska did not occur until 2015 under the Affordable Care Act. Proximity to a dental provider in the small community of Juneau, which utilizes public transit and has approximately 40 miles of paved, two-lane highway, remained unchanged during the study period.

Results

Univariate analysis of the data indicated that half of the participants were male (51.2%). Slightly more than one-half (53.9%) of the participants self-identified as American Indian or Alaska Native (AI/AN), and 30.9% self-identified as white/Caucasian. While the AI/AN community accounts for only 13.4% of Alaska's total population, they are over-represented in the Medicaid group due to historical oppression resulting in poverty. Table 1 summarizes the full descriptive statistics of the complete study population for the 0- to 18-year-old age groups.

We conducted a bivariate analysis of the mean number of caries procedures for the study groups under both conditions to address the first research objective assessing the extent to which CWF cessation impacts the frequency of dental caries procedures. According to the results of a Shapiro-Wilk test ($p < 0.0001$), the data were not normally distributed. Therefore, a Mann-Whitney U test was used to evaluate the difference in the mean number of dental caries-related procedures per child between the two independent CWF groups of different sizes. The results in Table 2 demonstrate that the mean number of caries-related procedures for the 0- to 18-year-old age groups was significantly higher in the suboptimal CWF group than that in the optimal CWF group (2.35 vs. 2.02, $p < 0.001$). The binary logistic regression results indicated that the odds ratio for patients aged 0 to 18 years living under optimal CWF conditions to receive a dental caries procedure was 0.748, indicating a protective effect (OR = 0.748, 95% CI [0.62, 0.90], $p < 0.0001$). In other words, the odds of a child or adolescent undergoing a dental caries procedure in 2003 was 25.2% less than that of a child or adolescent in the suboptimal CWF group.

Our analysis for the second research objective yielded similar results (Table 3). The mean caries-related treatment cost for the 0- to 18-year-old age cohort was significantly higher in the suboptimal CWF group than that in the optimal CWF group (\$593.70 vs. \$344.34, $p < 0.0001$) without adjusting for inflation. According to the U.S. Department of Labor Consumer Price Index [47], the inflation rate increased an estimated 24.75% between 2003 and 2012. Therefore, the increase in inflation-adjusted provider service charges in caries treatment costs

Table 1 Descriptive Statistics of the Juneau Study Sample by CWF Status ($n = 1905$)

Descriptor	Optimal CWF Year 2003 (0.7–1.2 mg/L)		Suboptimal CWF Year 2012 (< 0.1 mg/L)	
	Frequency	Percent	Frequency	Percent
<i>N</i>	853	44.8	1052	55.2

Unknown	33	3.9	16	1.5

associated with CWF cessation for the 0- to 18-year-old age group was +47%, or \$161.84. According to logistic regression analysis, the odds that a patient aged 0 to 18 years under optimally fluoridated conditions would be billed for dental caries treatment was 0.749, which was 25.1% less than that for a patient of the same age in the suboptimal CWF conditions group (OR = 0.749, 95% CI [0.623, 0.90], $p < 0.002$).

Lastly, our analysis for the third research objective considered which age group suffered the largest caries procedure burden under both CWF conditions. Bivariate analysis revealed that the mean number of caries-related procedures per patient for children under 7 years old was significantly higher in the suboptimal CWF group than that in the optimal CWF group (2.68 vs. 2.01, $p < 0.004$). The results from binary logistic regression were also significant (OR = 0.699, 95% CI [0.52, 0.95], $p < 0.02$) and similar to previous results, indicating a protective effect for optimal CWF exposure. Caries treatment costs were also higher in the under 7-year-old suboptimal CWF group than those in the optimal CWF group (\$692.87 vs. \$350.13, $p < 0.0001$). After adjusting for inflation, we observed a caries treatment cost increase of 73% attributable

to CWF cessation and estimated at approximately \$255.60.

The results for the group of individuals born after CWF cessation and aged <6 years were of particular interest to the research team. These results are also included in Tables 2 and 3 and Fig. 1, which summarize the differences in the mean number of caries procedures and treatment cost results and illustrates consistent epidemiologic trends. The children without exposure to optimal CWF suffered a higher percent increase in caries procedures along with higher restoration costs, thus signifying greater tooth surface loss to decay secondary to weaker enamel (2.52 vs. 1.55, $p < 0.0001$) (\$644.72 vs. \$272.73, $p < 0.0001$) (Fig. 1). According to binary regression analysis for the under six-years-old age group, the odds of undergoing dental caries procedures under optimal CWF conditions was 51% less than that for a child of the same age in 2012 under suboptimal conditions (OR = 0.488, 95% CI [0.33, 0.73], $p < 0.0001$).

Discussion

The results of this study confirm the benefits of optimal CWF supported by previous research and can contribute

additional research-based evidence regarding the oral health consequences and costs that can arise when CWF is discontinued. The most common modality of study among previous CWF cessation research was a concurrent cross-sectional analysis using DMFT screening in a community that had ceased CWF at some point in the past compared to a community that continued optimal CWF [26]. Therefore, this research offers an alternative modality for studying the effects of CWF using Medicaid claims data from the same community before and after CWF cessation.

The results demonstrate a statistically significant increase in the number of dental caries procedures and associated treatment costs for the general cohort under suboptimal CWF conditions in 2012 among patients aged 0 to 18 years (2.35 vs. 2.02, $p < 0.001$). This increase was more pronounced among younger age groups under suboptimal CWF conditions, specifically the < 7-year-old age group (2.68 vs. 2.01, $p = 0.004$) and the < 6-year-old age group who were born after CWF was ceased (2.52 vs. 1.55, $p < 0.0001$).

The naturally occurring fluoride level in Juneau's water since CWF was ceased in January 2007 has remained between 0.05–0.065 mg/L per annual reporting, which is

more than ten-times less than the optimal CWF level needed for caries prevention [35]. Previous research indicates that without the presence of optimal levels of fluoride in drinking water, and thus in the mouth and saliva, teeth may form with weaker enamel and lack the ability to remineralize early signs of decay [9, 25, 31, 48]. Therefore, we expected to observe a general increase in dental caries-related procedures and treatment costs across age groups because fluoride acts primarily topically [9, 48]. Additionally, we expected to observe more significant impacts among patients with the lowest exposure to optimal CWF.

In this study, a major advantage of acquiring both pre- and post-fluoride cessation data in this natural setting was the potential to assess the net differences in the intervention condition (suboptimal CWF) and in the control condition (optimal CWF) [49]. The results indicate a clear caries epidemiologic shift toward a caries increase among patients without the protective benefit of optimal CWF. As no significant difference in the mean number of caries procedures was observed between the 7- to 12- and 13- to 18-year-old age groups, we suggest that these individuals may have a residual protective effect from optimal CWF exposure during childhood and

Fig. 1 Mean caries restoration costs according to age for children with optimal or suboptimal community water fluoridation (CWF). First, the mean cost in 2003 for children with optimal CWF was calculated; the mean cost in 2003 was then adjusted for inflation (*1.25) according to the 2012 dollar value; and lastly the increase cost attributed to suboptimal CWF was calculated

early adolescence. Additionally, between 2003 and 2012, we observed a sevenfold overall increase in the placement of sealants. Optimal CWF exposure during childhood, plus the increased use of dental sealants during school-aged years, may explain the results among the older cohorts; however, this topic requires further investigation [27–29].

Overall, we were able to measure the influence of the independent variable, CWF, on the dependent variables, dental caries procedures and treatment costs, both before and after cessation by utilizing a study population comprising participants living at or near poverty conditions. The similarity of the target groups' income criteria for Medicaid eligibility adds strength to the internal validity of the study; therefore, the results and causal implications are more valid than if the results had been derived from the general population [22, 49]. Second, the external validity of the results was also increased by working with only Medicaid claims data, which limited the influence of higher-income groups [22, 50]. Families with high incomes may have easier access to dental care and may more routinely visit a dentist or refill supplemental fluoride tablets, which could potentially dilute small changes in caries rates under fluoridation and non-fluoridation conditions [22, 24, 27, 50]. Therefore, the results are likely generalizable to other Medicaid groups in communities considering CWF cessation.

Regarding reliability, variations in providers' therapeutic approaches and billing practices may have had some influence, but we anticipate that these variations were similar in both study years. The data were managed and recoded by only two individuals, and errors were estimated to be minimal. In summary, the internal and external qualities of this study support generalizability to other 0- to 18-year-old Medicaid populations in Alaska who have already ceased CWF or are considering CWF cessation. The methodology and analysis processes are certainly transferrable to other regions and offer an innovative metric option for future oral health research and statewide public health surveillance programs.

The results presented in Table 3 indicate a progressively higher caries risk and cost burden for the younger age groups in the suboptimal CWF cohort. Please recall that older patients in this study were exposed to several years of optimal CWF as young children born prior to cessation in 2007. For example, patients in the 7- to 13-year-old age group were born between 2000 and 2005 and thus benefited from early-life/childhood optimal CWF exposure. Overall, the costs of caries treatment services increased for each age group cohort, even after adjusting for inflation, and were markedly higher under suboptimal CWF conditions. These results support current evidence that even in modern conditions with widely available fluoride toothpaste, rinses,

and professionally applied prophylaxis, CWF is associated with population benefits, including cost effectiveness and caries prevention [6, 7, 22, 24, 31, 50, 51].

Limitations

The study has a number of limitations. First, due to funding limits, only two years of data were purchased for comparison rather than five to ten years of data, which would have enabled a more sophisticated trend analysis. Second, dental claims for extractions or full-mouth reconstruction were removed from the primary data analysis because we could not confirm that these procedures were caries-related without the clients' full medical records. Therefore, caries procedures and costs may be underrepresented in the results. Third, the coding scheme also assumes that within 1 year, the dental professional treated all points of decay for each individual patient and did not over- or undertreat. Lastly, if an eligible child did not visit the dentist that year, then no claims forms were generated, and they were not included in the study.

While the use of reimbursement claims records as the primary metric for longitudinal evaluation in a pre- and post-CWF-exposed population was innovative, a precedent had been set by concurrent comparison population analyses completed in Louisiana [16] and New York [22] and by the Texas Department of Public Health [23]. Additional methodological factors include identification of strategies to control for confounders and the issue of measuring short-term versus long-term changes. Rugg-Gunn and Do [40] remark that among studies published in the last twenty-five years exploring CWF using a cross-sectional comparison methodology, the use of multivariate statistical analyses with adjustments for confounders has yielded minimal change in the net effect of CWF on caries reduction. Typical covariates for dental caries and dozens of other negative health outcomes include diet, parental education and parental income [40]. As with most negative health outcomes, these covariates can play roles in determining an individual's oral health, often influencing diet options, social norms toward seeking preventative dental care, prioritization of home oral care practices and stress levels [24, 28]. We acknowledge baseline and comparison data regarding parental education among low income families, home oral hygiene practices, and dietary habits to be unknown considerations. However, proxy measures may offer some estimates of influence. For example, the Alaska Youth Risk Behavioral Survey (YRBS) tracks sugar-sweetened beverage (SSB) consumption among teens, which appears to be declining, mirroring national trends. According to the YRBS for Alaska in 2007, 21.8% of youths drank one SSB one or more times per day during the past 7 days, while in 2013, the rate

was 15.8% [52, 53]. While the trend of reduced SSB and thus added sugar consumption may be declining nationally and statewide, the reduction is highly unlikely to be sufficient to result in a reduction in caries (< 10% of total daily calories) [54, 55].

Based on available population estimates, we note only small changes between the 2003 and 2012 Juneau Borough censuses and minimal changes to Medicaid eligibility requirements. Therefore, common sense would support that the parental education level among Medicaid-eligible families was also comparable between the two groups. While the similarities in population size and socioeconomic conditions may strengthen the validity of the study conclusions, they can also be viewed as a limitation for the generalizability of the study's results to other populations that experience more in-and-out migration or wider variations in income.

Other covariates that may have influenced the results include prescriptive fluoride supplementation, school fluoride rinse programs, and dental sealants. No school-based oral health or school rinse programs existed in Juneau before, during or after the study period, and prescriptive supplementation has always remained very limited (personal communications with Dr. Whistler and Dr. Hort, January 2016). Notably, among studies exploring other probable confounders, such as widely available fluoride toothpaste, moderate access to school-based fluoride varnish programs and in-office fluoride applications, researchers have reported that optimal CWF still improves oral health among children through caries prevention, enamel remineralization and cost savings [22, 28, 31, 50, 51, 56, 57]. Lastly, another potential limitation of this study is that we do not have information regarding fluoride toothpaste use in this low-socioeconomic status population, and fluoride toothpaste use may be much lower than that expected in other populations. Such information could strengthen the conclusion regarding the benefit of CWF in this population compared to other populations that regularly use fluoride toothpaste.

Conclusion

This study analyzed oral health changes secondary to CWF discontinuation among Medicaid-eligible children and adolescents in a community in which the local government ceased fluoridation of the public water system. We examined the relationship between dental caries-related procedures and costs under optimal and suboptimal CWF conditions through rigorous statistical analysis of Medicaid dental claims records and formed the following conclusions. According to the aforementioned results, CWF cessation promoted a marked increase in the number of caries-related procedures and treatment costs for Medicaid-eligible children and adolescents aged 0–

18 years. Additionally, the results indicated that children in the younger age group cohorts underwent more dental caries procedures than the older age group cohorts, who had benefited from early childhood exposure to optimal CWF. These results add to the growing body of information available regarding CWF cessation epidemiology by both confirming the dental caries prevention benefit of CWF and expanding the evidence base regarding the oral health impacts of CWF cessation under contemporary conditions.

The analysis also can offer fiscal estimates that can be used by community leaders and decision-makers who are considering CWF cessation and may need to plan for the increased revenue required to address the treatment costs among clients relying on state and federal government subsidies. With this study, dental and public health professionals also have access to more evidence to accurately inform officials establishing future community water fluoridation policies and to illustrate how CWF cessation can affect individuals, especially children, in economically vulnerable or low-income circumstances [22, 24, 28, 50].

Dear Green Bay Common Council,

On behalf of the Village of Wrightstown, I write to express our overwhelming support for community water fluoridation. The Green Bay Water Utility supplies us with treated water that contains fluoride at the appropriate level to promote dental health for our customers, and we would like to be able to continue this offering as a wholesale customer of the Green Bay Water Utility.

The science behind fluoridation of water and decades of success, with agreement from every major health organization from the Centers for Disease Control and Prevention (CDC) to the American Dental Association (ADA), concluded that fluoridated water protects teeth without posing risks to health. While fluoride is naturally occurring in almost all water supplies, we appreciate that Green Bay Water Utility has adjusted the level by adding fluoride to achieve the right amount to reduce tooth decay.

Before the common practice of fluoridation, health organizations believe lack of fluoride is one of the major reasons that many people needed dentures, which were quite common before widespread fluoridation. Science and studies prove that dental costs are lower and oral health problems have declined in fluoridated communities, having an important impact on our overall health and lowered many families' dental budgets.

Many times misleading information associates fluoride with fertilizer and industrial waste. The reality is that fluoride is extracted from phosphate rock, and so is phosphoric acid, an ingredient in name brand soft drinks such as Pepsi and Coca Cola. Neither one of them comes from fertilizer. It is important to base decision-making on true and corresponding health related information and the science behind water treatment.

Dental disease is the most common childhood disease and is associated with diabetes, adverse pregnancy outcomes, heart disease and lost school and work hours.

Science and health stats show fluoridated water decreases tooth decay by nearly 25 percent in children as well as in adults. The science behind this treatment has also proven to save communities money, by reducing costs and lost work hours spent on repairing tooth decay. For most communities, every \$1 invested in water fluoridation saves \$38 in unnecessary dental treatment costs. Green Bay Water Utility has been wise to use this proven intervention and we urge its continuation to benefit all of the people who drink Green Bay water.

Travis Coenen, Village Administrator

Re: Potable Drinking Water -- Fluoride Addition

Dear Nancy:

Thank you for the opportunity to discuss the topic of fluoride addition in potable drinking water. From time to time, questions come forth as to the viability of adding fluoride to public drinking water and its effectiveness in providing a measurable impact on the teeth of those drinking the water. When questions of this nature come forth, we show them the respect they are due by turning to the experts in the professions who see the end results on a daily basis. In this case, our dental professionals are the front-line viewers of what the addition of fluoride to public drinking water has on the teeth of those who drink water with versus without the addition. From our local dentists to the American Dental Association, the results, and recommendations they consistently urge is to maintain a beneficial level of fluoride in drinking so as to aid in the development and protection of teeth. The Green Bay Water Utility has followed CDC and WDNR guidelines for decades in the addition of fluoride to its drinking water to the benefit of many generations of families. In following the recommendations and results from the experts in the dental professions, as well as the national associations within that field, we continue to support the fluoride addition to potable drinking water.

Thank you very much for your time.

Sincerely,

**Douglas J. Martin, P.E.

RE: Green Bay Water Utility Fluoride Levels

August 11, 2020

The Village of Hobart, purchasing water from Green Bay Water Utility for about a decade, has been very satisfied with the quality of the water and levels of Fluoride in that water.

It has been our experience that Green Bay Water Utility, being a member of the AWWA, keeps current with the applicable research and recommendations for optimal Fluoride levels in the drinking water. The recommendations of AWWA in turn follow the science and research conducted by the CDC, AMA, and WHO among others, for beneficial and safe levels of Fluoride in our drinking water.

The proven benefits from Fluoride to aid in strengthening teeth and preventing tooth decay has been well documented worldwide as nearly all developed countries practice fluoridation. The 25% reduction in tooth decay estimated from the use of low levels of fluoride is a safe and cost effective means of aiding our residents in maintaining a healthy lifestyle while potentially saving money in health care costs.

The Village of Hobart does not wish to see a deviation in levels of Fluoride in our water supply from the Green Bay Water Utility. I believe changes from the AWWA recommended levels they have followed in the past will decrease the value of the water supplied to our residents.

Respectfully,

Jerry Lancelle
Public Works Director
Village of Hobart

**SCOTT MUNICIPALITY UTILITY - BROWN COUNTY WISCONSIN
RESOLUTION 2020-08-01
SAFE DRINKING WATER**

WHEREAS, Scott Municipal Utility's (SMU's) number one objective is to provide customers with safe drinking water, and

WHEREAS, SMU strives to follow all federal, Wisconsin, and local regulatory guidelines and recommendations relative to the addition of and maintenance of recommended chemicals, including fluoride, and

WHEREAS, SMU, at the same time, recognizes the concerns of customers relative to safe levels of said chemicals in their drinking water, and

WHEREAS, SMU will continue to depend on the medical experts, scientific community, and regulatory agencies to establish the safe level for each chemical found in or added to the drinking water provided to our customers, and

WHEREAS, SMU is a wholesale customer of the Green Bay Water Utility.

NOW THEREFORE BE IT RESOLVED the SMU strongly encourages the Green Bay Water Utility to follow all federal, Wisconsin, and local regulatory guidelines and recommendations relative to the addition of and maintenance of recommended chemicals, including fluoride, and

FURTHER, SMU strongly encourages Green Bay Water Utility to depend on the medical experts, scientific community, and regulatory agencies to establish the safe level for each chemical found in or added to the drinking water provided to their wholesale and retail customers.

Adopted this 3rd day of August, 2020.

I hereby certify that the foregoing resolution was duly adopted by the Scott Municipal Utility Commission at a legal meeting on the 3rd day of August, 2020.

ADOPTED THIS 3rd DAY OF AUGUST, 2020

September 18, 2020

Green Bay Protection and Welfare Committee,

We, the appointed Board of Health, wish to submit this letter in support of continued fluoridation of our local water. We understand that this topic has again been brought forward for consideration.

At our August 11, 2020 meeting, two constituents spoke against fluoridation and were supported by two individuals calling from other states identifying as experts. Water fluoridation was supported and evidence was cited by Dr. Russell Dunkel, State Dental Director as well as an outside caller, Dr. Johnny Johnson. Nancy Quirk, Green Bay Water Utility General Manager, with expertise in water safety gave reassurance of the support and evidence of benefit to fluoridation. We are grateful for the interested participation of our community on this and all topics and are committed to examining credible new data and research as it becomes available.

According to the Center for Disease Control website (CDC.gov), community water fluoridation is recommended by nearly all public health, medical, and dental organizations. It is recommended by the American Dental Association, American Academy of Pediatrics, US Public Health Service, and World Health Organization. The CDC goes on to say that because of its contribution to the large decline in cavities in the United States since the 1960s, CDC named community water fluoridation one of 10 great public health achievements of the 20th century.

With this firm endorsement of water fluoridation by these prominent and recognized experts, we are confident that water fluoridation is the right public health provision for our community. We are taking this opportunity to reaffirm our support, as the Board of Health, for continued fluoridation of water.

Please feel free to reach out to us for any reason.

Respectfully submitted,

Respectfully,

100 N Jefferson Street
Room 203, City Hall
Green Bay, WI 54301

Dear Green Bay Common Council,

I am writing on behalf of the Wisconsin Oral Health Coalition (WOHC) in addition to several other local, state and national organizations representing the medical and dental communities among other community based organizations in support of community water fluoridation. This broad-based coalition continues to support community water fluoridation and urges the city of Green Bay to continue providing this safe and effective measure to the citizens of Green Bay and those in communities who purchase water from the city. We applaud the work that the Policy and Protection Committee has done in listening to nearly 10 hours of public comments and discussing this issue at length. We urge you to support the hard work of this committee and continue this important public health measure in your community.

Our medical, dental and community partners want to make it clear this is not a debate amongst the medical and dental communities. More than 100 national and international medical, dental and community based organizations continue to support fluoridation while opposition comes only from a small but vocal group not looking at the entire body of evidence on this subject.

Community water fluoridation is a safe, cost-effective health measure for preventing tooth decay. Community water fluoridation saves families money that would otherwise pay for more frequent fillings and other dental treatments. Green Bay spends \$30,505.12, or 22 cents per resident, to provide this proven public health benefit to 140,000 individuals. Delta Dental of Wisconsin, a not-for-profit service corporation, compared claims data from Delta Dental of Wisconsin members residing in communities with and without community water fluoridation. They estimate fluoridation saved Wisconsin residents more than \$6.1 million in 2011 by reducing the need for fillings, crowns or other costly procedures. Nearly 90 percent of the population in Wisconsin on public water supplies has access to the benefits of optimal levels of fluoride.

Communities that fluoridate their water across the country have an average of 25 percent less dental disease compared to those that do not. This is true even with the introduction of other fluoride containing products like toothpaste and rinses. The negative impact of ceasing community water fluoridation is disproportionate to lower income and other health-disadvantaged populations experience poorer oral health and significant barriers to dental care. As a result, the removal of water fluoridation will be especially damaging for already health-disadvantaged populations and will worsen oral health inequities.

We hope you will listen to the medical, dental and public health experts on this issue and continue this important practice in your community. Ending this effective program would be a detriment to the community and a step backward in the area of prevention. Please support community water fluoridation by maintaining the City of Green Bay's community water fluoridation program.

Please let me know if you have any questions or would like more information about community water fluoridation.

Sincerely,

A handwritten signature in black ink, appearing to read "Matt Crespin".

Report to the Green Bay Plan Commission

MEETING DATE

December 1, 2020

PREPARED BY

Paul Neumeyer, Staff

AGENDA ITEM # P.1

To allow the property owner to continue to rent the subject property, 1135 Shadow Lane, under the conditions of the Short Term Rental Permit (STRP) and that any further substantiated claims or violations reported, within the next 6 months, shall be brought back before the Plan Commission for further consideration and potential action.

BACKGROUND

Primary Address: 1135 Shadow Lane

Reason for Request: To review past violations on the subject property relative to the Short Term Rental Permit.

Aldersperson/District: Ald. Chris Wery / District 8

Surrounding Zoning and Land Uses:

SUBJECT: Low Density Residential (RI) - Single-family dwellings

NORTH: Low Density Residential (RI) - Single-family dwellings

SOUTH: Low Density Residential (RI) - Single-family dwellings

EAST: Low Density Residential (RI) - Single-family dwellings

WEST: Low Density Residential (RI) - Single-family dwellings

Comprehensive Plan: The 2022 Smart Growth Plan designates this area as low density residential uses.

Report: Over the past few months, staff has received a handful of complaints on the subject property. The complaints have been summarized in detail by the Green Bay Police Department and are attached within this agenda packet. No other zoning violations were noted in the research by staff. The property owner, Kurt Stricker, Shadow Lane GB, LLC, has renewed his Short Term Rental Permit (STRP) for 2020 and the permit has been active since late 2018. Another item within this agenda, ZP 20-34, is being considered under similar terms but, is not related to violations on the subject property and will be reviewed under its own merits as a separate action item. Short term rentals are a permitted use in the RI District with the following development standards:

13-1609. Accessory uses. (Amd. GO 36-09)

(j) Short-term Rentals (STRs). (Cr. GO 9-09; Rep. & Rec. GO 20-16)

(l) Prior to occupancy as a short-term rental, the following shall be obtained by the local representative:

State of Wisconsin Tourist Rooming House Permit

State of Wisconsin Sale and Use Tax Permit

Proof of registration with the City of Green Bay Treasurer regarding Brown County Room Tax requirements.

Proof of registration with the Brown County Health Department.

A lease agreement example provided that indicates language regarding compliance with parking, noise and other applicable City of Green Bay ordinances being met during occupancy of the structure.

City of Green Bay Short-term Rental Permit (STRP)

(2) A submittal for Short-term Rentals (STRs) shall include the following:

a. Initial application

1. Completed STRP application on a form established by the City.

2. \$100.00 application/review fee.

3. Proof of insurance.

4. Necessary permits and proof of registration as required in 13-1602(j)(1), Green Bay Municipal Code.

b. Renewal of a STRP

1. A STRP is valid for one year and shall expire on June 1 of the calendar year. A STRP may be renewed on an annual basis and shall meet the following standards:

a) Proof of insurance.

b) Necessary permits and proof of registration as required in 13-1602(j)(1), Green Bay Municipal Code.

c) Renewal Fee: \$100.00

(3) The number of occupants in STRs shall not exceed the limits set forth in the State of Wisconsin Uniform Dwelling Code and other applicable County and City of Green Bay housing regulations for residential structures based on the number of bedrooms within the unit.

(4) STRs are issued to a specific owner of a Short-term rental. STRs shall be terminated when the permit holder sells or transfers the real property which was rented, except for a change in ownership where the title is held in survivorship or transfers on the owner's death.

(5) Availability of STRs to the public shall not be advertised on site.

(6) A STRP shall be visible from the exterior of the principal structure and shall contain the name and telephone number of the local representative.

(7) STRs shall not violate any applicable conditions, covenants, or other restrictions on real property.

(8) Alcohol may not be sold on site.

(9) STRs granted by the City may be subject to review on a yearly basis or when the Planning Director or Plan Commission has reason to believe that the regulations are not being adhered to or that there are problems associated with the STRs that warrant review by the Plan Commission and the Green Bay Common Council. STRs may be revoked based on the findings of the Plan Commission. STRs denied by the Planning staff may be appealed to the Plan Commission and Common Council.

(10) No Recreational Vehicle (RV), camper, tent or any other temporary lodging arrangement shall be permitted on site for the means of providing accommodations for occupants and/or guests of a Short-term rental.

(11) STRs shall comply with all requirements of this ordinance and all applicable standards of the Green Bay Municipal Code.

(12) Violations: Failure to comply with the requirements above shall constitute a violation of the provisions of this section. Disturbances or nuisances caused by the tenants of an approved STR which violate the City Municipal Code, including but, not limited to, outdoor events and existing noise ordinances or State law, shall also constitute a violation. Penalties for each violation shall be imposed in an amount not to exceed \$500, including court costs, and may result in permit suspension or revocation.

It was determined by the staff, having receiving substantiated complaints by the Police Department, that the complaints should be presented to the Plan Commission and eventually the Common Council for their information and possible consideration under provision (9) above. It appears that complaints have been resolved and continue to be monitored by the Police Department.

Staff believes because these complaints were dealt with in a timely manner from their occurrence that there are no pending complaints. Staff believes that some latitude can be given to the property owner to continue to rent this property. With the limitation that any future substantiated claims or violations, within the next 6 months, be brought back before the Plan Commission for further consideration and potential action. Ald. C. Wery and adjacent property owners have been notified of the request. As of the drafting of this report, staff

has two inquiries to the request.

RECOMMENDATION

Staff is recommending that the property owner may be allowed to continue to rent the subject property under the conditions of the Short Term Rental Permit (STRP). If further substantiated claims or violations are reported within the next 6 months, those violations shall be brought back before the Plan Commission for further consideration and potential action.

Break Down of calls for 1135 Shadow Lane

Noise Complaint on 9/21/2019 @ 9:16 pm (19-057473) – Comp [REDACTED] reported loud music from the backyard of this address. [REDACTED] described as a band playing for several hours. Officers spoke with [REDACTED] who was hosting a small get-together with a band. Officers were on scene around 10:55 pm and the band had been done and was breaking down the equipment. **No Enforcement Action Taken**

Noise Complaint on 8/22/2020 @ 5:35 pm (20-048596) – Comp [REDACTED] reported a band playing in the backyard at an extremely loud level. Officers spoke with [REDACTED] who informed them the band was done at 9:30 pm. Officers on scene found the noise to be reasonable given it was a weekend and taking the time into consideration. **No Enforcement Action Taken**

Noise Complaint on 8/22/2020 @ 8:41pm (20-048624) - Comp [REDACTED] reported a live band in the backyard of this residence and estimated 20 cars/40 people present. Officers spoke with the comp who thought it was reasonable to allow the music to continue until 10pm noise ordinance would be in effect. Asked officers to check back on property around 10:30pm. **No Enforcement Action Taken**

Noise Complaint on 8/22/2020 @ 10:43pm (20-048637) – Comp [REDACTED] called in reporting lots of yelling and loud music going on and off. A Landlord Referral was completed to document the complaints and generate a letter to the landlord along with a written warning. **Written Warning was issued to property owner.**

In reviewing the calls for service for this address only one call came in for 2019. The band was done and breaking down by the time officers were on scene. The three calls for service in 2020 all came in on the same day for a live band. No enforcement action was taken on the first two calls due to the level of noise, time of day, and consideration for the weekend. Officers were called a third time for yelling and loud music after 10pm (not the live band). A written warning was issued to [REDACTED] for the late noise issue, as this has been the first problem this year. Officer Robinson was able to contact [REDACTED] and pass on his contact information to Alder Wery as requested. [REDACTED] explained that he was operating under the assumption he had until 11pm for his band. He will change the Airbnb listing to reflect the 10pm noise ordinance as well and work with the police department to avoid further issues. Even with the one written warning this year, this property would not qualify for a chronic or public nuisance based on the amount and nature of the calls for service.

Subject: Comments for Short Term Rentals
Date: Monday, November 23, 2020 4:19:01 PM

Hi Paul,

My apologies, I am not able to make the meeting tonight so I will submit some comments.
Please read this:

Plan Commission, thanks for hearing about the issues at these addresses. It is important to remember that applicants for any short term rental agree to certain provisions in order to rent out a home.

Here is one of those stipulations:

- Agree to assure that use of the premises by short-term rental occupants will not disrupt the neighborhood, and will not interfere with the rights of neighboring property owners to the quiet enjoyment of their properties.

Please review the police complaints for loud parties and also recognize there are DPW complaints for garbage storage, bin storage and lawn parking.

Many short term rentals quietly rent to out of town families and are generally great neighbors. Some keep pushing the envelope and make it seem like they are a bar located in a residential area. Obtaining a license for a short term rental is a privilege not a right. I would not be opposed to any corrective measures seemed necessary by the Plan Commission in order to send a strong, clear message about what we expect from these types of licensed properties.

**I will also be addressing this at city council next week and invite any interested parties to join me.

Alderman Chris Wery

Report to the Green Bay Plan Commission

MEETING DATE

December 1, 2020

PREPARED BY

Paul Neumeyer, Staff

AGENDA ITEM # P.2

To allow the property owner to continue to rent the subject property, 1136 Shadow Lane, under the conditions of the Short Term Rental Permit (STRP) and that any further substantiated claims or violations reported, within the next 6 months, shall be brought back before the Plan Commission for further consideration and potential action.

BACKGROUND

Primary Address: 1136 Shadow Lane

Reason for Request: To review past violations on the subject property relative to the Short Term Rental Permit.

Aldersperson/District: Ald. Chris Wery / District 8

Surrounding Zoning and Land Uses:

SUBJECT: Low Density Residential (R1) - Single-family dwellings

NORTH: Low Density Residential (R1) - Single-family dwellings

SOUTH: Low Density Residential (R1) - Single-family dwellings

EAST: Low Density Residential (R1) - Single-family dwellings

WEST: Low Density Residential (R1) - Single-family dwellings

Comprehensive Plan: The 2022 Smart Growth Plan designates this area as low density residential uses.

Report: Over the past few months, staff has received a handful of complaints on the subject property. The complaints have been summarized in detail by the Green Bay Police Department and are attached within this agenda packet. On two separate occasions, complaints were filed in October and November of this year regarding excessive amounts of garbage on the site. However, in each case, when the Inspector arrived, they did not observe any garbage issues and the cases were closed.

The property owner, Matt Keesey, has renewed his Short Term Rental Permit (STRP) for 2020 and the permit has been active since August 2018. Another item within this agenda, ZP 20-33, is being considered under similar terms but, is not related to violations on the subject property and will be reviewed under its own merits as a separate action item. Short-Term rentals are a permitted use in the R1 District with the following development standards:

13-1609. Accessory uses. (Amd. GO 36-09)

(j) Short-term Rentals (STRs). (Cr. GO 9-09; Rep. & Rec. GO 20-16)

(l) Prior to occupancy as a short-term rental, the following shall be obtained by the local representative:

State of Wisconsin Tourist Rooming House Permit

State of Wisconsin Sale and Use Tax Permit

Proof of registration with the City of Green Bay Treasurer regarding Brown County Room Tax requirements.

Proof of registration with the Brown County Health Department.

A lease agreement example provided that indicates language regarding compliance with parking, noise and other applicable City of Green Bay ordinances being met during occupancy of the structure.

City of Green Bay Short-term Rental Permit (STRP)

(2) A submittal for Short-term Rentals (STRs) shall include the following:

a. Initial application

1. Completed STRP application on a form established by the City.

2. \$100.00 application/review fee.

3. Proof of insurance.

4. Necessary permits and proof of registration as required in 13-1602(j)(1), Green Bay Municipal Code.

b. Renewal of a STRP

1. A STRP is valid for one year and shall expire on June 1 of the calendar year. A STRP may be renewed on an annual basis and shall meet the following standards:

a) Proof of insurance.

b) Necessary permits and proof of registration as required in 13-1602(j)(1), Green Bay Municipal Code.

c) Renewal Fee: \$100.00

(3) The number of occupants in STRs shall not exceed the limits set forth in the State of Wisconsin Uniform Dwelling Code and other applicable County and City of Green Bay housing regulations for residential structures based on the number of bedrooms within the unit.

(4) STRs are issued to a specific owner of a Short-term rental. STRs shall be terminated when the permit holder sells or transfers the real property which was rented, except for a change in ownership where the title is held in survivorship or transfers on the owner's death.

(5) Availability of STRs to the public shall not be advertised on site.

(6) A STRP shall be visible from the exterior of the principal structure and shall contain the name and telephone number of the local representative.

(7) STRs shall not violate any applicable conditions, covenants, or other restrictions on real property.

(8) Alcohol may not be sold on site.

(9) STRs granted by the City may be subject to review on a yearly basis or when the Planning Director or Plan Commission has reason to believe that the regulations are not being adhered to or that there are problems associated with the STRs that warrant review by the Plan Commission and the Green Bay Common Council. STRs may be revoked based on the findings of the Plan Commission. STRs denied by the Planning staff may be appealed to the Plan Commission and Common Council.

(10) No Recreational Vehicle (RV), camper, tent or any other temporary lodging arrangement shall be permitted on site for the means of providing accommodations for occupants and/or guests of a Short-term rental.

(11) STRs shall comply with all requirements of this ordinance and all applicable standards of the Green Bay Municipal Code.

(12) Violations: Failure to comply with the requirements above shall constitute a violation of the provisions of this section. Disturbances or nuisances caused by the tenants of an approved STR which violate the City Municipal Code, including but, not limited to, outdoor events and existing noise ordinances or State law, shall also constitute a violation. Penalties for each violation shall be imposed in an amount not to exceed \$500, including court costs, and may result in permit suspension or revocation.

It was determined by the staff, having receiving substantiated complaints by the Police Department, that the complaints should be presented to the Plan Commission and eventually the Common Council for their information and possible consideration under provision (9) above. It appears that complaints have been resolved and continue to be monitored by the Police Department.

Staff believes because these complaints were dealt with in a timely manner from their occurrence and that there are no pending complaints. Staff believes that some latitude be given to the property owner to

continue to rent the subject property. With the limitation that any future substantiated claims or violations, within the next 6 months, be brought back before the Plan Commission for further consideration and potential action. Ald. C. Wery and adjacent property owners have been notified of the request. As of the drafting of this report, staff has two inquiries to the request.

RECOMMENDATION

Staff is recommending that the property owner may be allowed to continue to rent the subject property under the conditions of the Short Term Rental Permit (STRP). If further substantiated claims or violations are reported within the next 6 months, those violations shall be brought back before the Plan Commission for further consideration and potential action.

Break down of calls for 1136 Shadow Lane

Noise Complaint on 6/21/2019 @ 10:17 pm (19-035299) – Comp [REDACTED] reported a loud party playing bag toss w/ 10-15 people present and lights in the backyard. Renter [REDACTED] was cooperative and agreed to shut the garage doors to limit the noise. Officer documented that they were watching sports and that they were warned they could be cited if calls continued that night. **No Enforcement Action Taken/No further calls that night**

Disturbance on 7/20/2019 @10:39 pm (19-042645) – Comp [REDACTED] reported a M/F verbal disturbance in front of this address. The parties went to 1136 Shadow and asked to use the bathroom then stood in the street and argued with each other. Officers spoke with a male [REDACTED] at 1136 Shadow and he advised the M/F were not with the group here and they left after asking to use the bathroom. **No Enforcement Action Taken/Parties unrelated to call address**

Noise Complaint on 8/9/2019 @ 11:07 pm (19-047631) – Officer Initiated Call, could hear yelling from inside the garage. Officers spoke with the persons and it was a party at the residence. They were warned about the noise. No calls from neighbors and no further calls on this group. **No Enforcement Action Taken**

Noise Complaint 8/15/2020 @ 12:09 am (20-046806) - [REDACTED] caller reporting possible underage drinkers at a party. The comp reported [REDACTED] asked them to “keep it down”. Officers spoke with [REDACTED], who had rented the house for a Bachelorette party. Officers observed they were playing games in the garage and were cooperative when asked to keep the noise down. **No Enforcement Action Taken**

Noise Complaint 8/15/2020 @ 10:49 pm (20-047006) – [REDACTED] caller reporting 15-20 females being loud in the garage. When officers arrived on scene they found the noise to be reasonable and could only hear talking. They did not make contact as the noise was not an issue. [REDACTED] caller made a second call at 11:31 pm stating they could still hear them being loud and playing music. Same officer had responded to all three calls made on 8/15/2020 and advised dispatch to have the caller leave their info for a call back. No further calls received that night. **No Enforcement Action Taken**

Disturbance on 8/28/2020 @ 9:08 pm (20-050001) – Comp [REDACTED] reported a possible verbal disturbance in the garage. Officers spoke with the residents inside who explained they had rented the house for a bachelorette party and there was no disturbance. They agreed to shut the garage door and were asked to keep it down. No further calls that night. **No Enforcement Action Taken**

In reviewing the calls for service there were five calls linked to the address, two in 2019 and three in 2020. None of them rose to the level that officers on scene felt the need to issue citations or written warnings (which would be needed for a chronic nuisance). Only one of two the noise complaints in 2019 was called in [REDACTED]. The two noise complaints and one disturbance for 2020 all happened between 8/15 and 8/28. Both noise complaints were called in by an [REDACTED] caller on 8/15 and both were related to persons playing games in the garage. The disturbance call on 8/28 was also related to parties playing games in the garage and this was a noise complaint more than a disturbance. This does not rise to the level of a Public Nuisance or a Chronic Nuisance. I have put in a call to [REDACTED] to spoken with him about these calls. We have been successful in working with the property managers on a similar rental on Liberty Street and curbing these types on calls. I am confident I will be able to work with [REDACTED] and limit further calls. He has agreed to sign up for our ALERT program and to also add the 10PM noise ordinance to his rental agreement/advertisement.

Report to the Green Bay Plan Commission

MEETING DATE

December 1, 2020

PREPARED BY

David Buck, Staff

AGENDA ITEM # P.3

To receive and place on file the Housing Market Study.

BACKGROUND

The Green Bay Redevelopment Authority commissioned MSA Professional Services Inc. to conduct a Housing Market Study, which was finalized in October 2020.

The purpose of this study is to help the City better understand its housing market and the housing market in surrounding communities (Allouez, Ashwaubenon, Bellevue, Suamico, De Pere and Howard)—the secondary market. This study examines the existing balance between housing demand and supply by analyzing data, talking to housing experts and understanding experiences of local residents. Based on this examination, gaps in the number, type, price point and location of housing units in Green Bay are indicated. To close these gaps and improve housing options in the City, this study lays out a toolbox of targeted strategies.

Not only will the study results assist in current program and policy decisions, they will assist as important background information for the update of the City's Comprehensive Plan as well as other area-wide planning.

The study is included in your agenda packet but can also be viewed on the City's website at:
<https://greenbaywi.gov/1176/Housing-Market-Study>

RECOMMENDATION

Staff is recommending to receive and place on file.

Affordable Housing:

Housing that serves lower-income residents, typically households earning 80% of the area median income (AMI) as calculated by the US Department of Housing and Urban Development (HUD).

Housing Affordability:

The measure of how much a household can spend toward total housing cost. The widely accepted standard for affordability states that a household should spend no more than 30% of their gross income toward housing costs.

Workforce Housing:

Housing that is affordable to the workforce in a community. Because incomes within the workforce vary, a range of housing options is needed to fit the needs of the community.

EXECUTIVE SUMMARY

GREEN BAY HOUSING MARKET STUDY

INTRODUCTION

The purpose of this study is to help the City better understand its housing market and the housing market in surrounding communities (Allouez, Ashwaubenon, Bellevue, Suamico, De Pere and Howard)—the secondary market. This study examines the existing balance between housing demand and supply by analyzing data, talking to housing experts, and understanding local residents' experiences. Based on this examination, gaps in the number, type, price point and location of housing units in Green Bay are indicated. To close these gaps and improve housing options in the City, this study lays out a toolbox of targeted strategies.

HOUSING GAPS & OPPORTUNITIES

Using both conservative and high growth scenarios to arrive at a range, the City will need the following to meet projected housing demand by 2040:

- **3,314 - 7,441 rental units (140 - 310/year)**

This equates to approximately the following per year, based on current rental pricepoints and HUD FY2020 income categories:

- 75-170 units with monthly rent up to \$1,030
- 50-110 units with monthly rent between \$1,150-\$1,650
- 15-30 units with monthly rent greater than \$1,440

- **4,052 - 9,098 owner-occupied units (170 - 375/year)**

This includes attached and detached units and equates to the following per year, based on current ownership price points and HUD FY2020 income categories:

- 35-75 units priced up to \$158,000
- 35-75 units priced between \$178,000-\$248,000
- 100-225 units priced greater than \$217,000

IMPLEMENTATION

(refer to pages 80-84 for more detail)

Goal

The City's primary housing goal is to Build Healthy

Neighborhoods. Healthy neighborhoods have:

- Varied housing types, sizes and price points, including both owner- and renter-occupied units. This enables more people to stay in the neighborhood as housing needs shift, and it limits future instability due to changes in the housing market.
- Sidewalks and urban design features that make walking pleasant and safe (whether for transportation or for pleasure).
- Convenient access to public transit and daily needs retail and services.
- Quality parks and open space.
- Community gather places, including both public venues (e.g. community center) and private venues (e.g. coffee shops).
- Active neighborhood associations and public or quasi-public places to meet within or near the neighborhood.

STRATEGIES TO IMPROVE HOUSING OPTIONS

Communication Strategies

1. **Establish Housing Committee**—The Housing Committee can be the driving force to implement this plan, provide oversight on the development and administration of funding programs, support public outreach about the City's housing needs and programs, and support updates to this plan as the market shifts and outside funding programs change.
2. **Improve Staff & Developer Communications & Processes**—Improve the experience for developers by coordinating feedback and sign-off from each department during the development review process. Increasing efficiency should also decrease costs to developers.

Initiatives

3. **Assist & Grow Neighborhood Associations**—Promote neighborhood identity and social cohesion through neighborhood associations. Use neighborhood associations as a way to engage residents in planning efforts and developments.
4. **Retain Inventory of and Market City-Owned Redevelopment Properties**—Continue maintaining a repository of properties owned by the RDA and

EXECUTIVE SUMMARY

incentives offered for residential and other types of development.

Regulation

5. **Amend Comprehensive Plan**—Update Future Land Use Map to include more flexibility in residential and mixed use areas.
6. **Examine Waiving or Reducing Development Fees**—Consider waiving or reducing fees on a case-by-case basis to encourage affordable housing and reduce costs to developers.
7. **Increase Code Enforcement for Converted Single-Family Rentals**—Create a targeted rental inspection program in areas with large number of single-family homes converted to rentals.
8. **Streamline Approval Process for Affordable Housing**—Streamline approval process for housing projects that include affordable units to offer an incentive to include these types of units in developments.
9. **Reduce Parking Requirements for Affordable Housing**—Consider reducing parking requirements for affordable multi-family developments located within a certain distance (1,000 to 1,500 feet) of a bus stop.
10. **Review Requirements for Landscaping and Building Materials in Zoning Code**—These elements can drive up developer costs. Review requirements for landscaping and hardscaping materials to see if any requirements can be softened or if there are materials that could be used to offer the same aesthetic at a lower price point.
11. **Adopt Policies That Encourage Accessory Dwelling Units (ADUs)**—Consider permitting ADUs by right in all residential areas. A requirement could be added that the property owner live on-site.
12. **Enable Cottage Courts Through PUDs**—Explore areas where cottage courts could be possible in the City and assemble and promote these areas to developers through the RDA.
13. **Create a Rural Holding (RH) Zoning District**—Create a Rural Holding District in the City's Zoning Code for undeveloped Land. The purpose of the district should be to hold land as agricultural or open space until it is ready to be placed into regular zoning classification such as R-1, R-2, etc.

Funding

14. **Create an Affordable Housing Trust Fund**—Create an Affordable Housing Trust Fund as a general purpose vehicle that can serve various affordability initiatives anywhere in the City.
15. **Utilize Tax Increment Financing for Affordable Housing Incentives**—Use TIF for the construction

of infrastructure to encourage the development of housing.

16. **Utilize Tax Increment Financing-Affordable Housing One-Year Extension**—Hold open TIF Districts that are about to be closed for one additional year beyond their planned or maximum duration to generate funds that can be used anywhere in the City for affordable housing.
17. **Promote the Use of the Federal and State Low Income Housing Tax Credit (LIHTC) Program**—Support and encourage developer use of LIHTC. Affordable Housing Trust Funds could be used as local match for LIHTC.
18. **Market Opportunity Zones**—Promote the four areas in the City that qualify under this program offering opportunity for private investment and development of workforce housing.
19. **Increase Use of Downpayment Assistance**—Promote Wisconsin Housing and Economic Development Association (WHEDA) and Federal Home Loan Bank of Chicago (FHLBC) downpayment assistance programs.
20. **Amend Rental Conversion Program Policy**—Consider the following changes to the City's rental conversion grant program: 1) at least 10% of funds must be used for exterior renovations; and 2) increase the maximum amount of the grant.

Partnerships

21. **Support Habitat for Humanity, NeighborWorks Green Bay and Other Affordable Housing Providers**—Maintain supply of lots for new home construction.
22. **Form Working Groups with Major Employers**—Convene major employers annually to discuss housing issues and initiatives.
23. **Coordinate with the University of Wisconsin-Green Bay and Northeast Wisconsin Technical College(NWTC)**—Work with the University to update its campus plan every 5-10 years. A big component of the plan should be plans to house students within the community. Partner with NWTC and the Department of Workforce Development to encourage people to seek training in building trades.

INTRODUCTION

This study was commissioned by the Redevelopment Authority (RDA) of the City of Green Bay. The RDA has identified housing as a critical issue that needs to be addressed to improve Green Bay and grow its economy based on feedback from various stakeholders. The purpose of this study is to help the City better understand its housing market and the housing market in surrounding communities (Allouez, Ashwaubenon, Bellevue, Suamico, De Pere and Howard), and to craft targeted strategies to improve housing options.

There are two parts to the Green Bay housing supply. The first is all of the housing in Green Bay and the second is all of the housing outside of Green Bay for people who go to school or work in the City. The housing in Green Bay is the easiest to measure and analyze, and is the part that the City has the most control over. The housing outside the City is a bit harder to quantify and qualify, but it is nevertheless important to our understanding of the overall market. This report attempts to document conditions and trends in the overall market, including an understanding of why people are choosing to live where they live.

STUDY PROCESS

This study uses a variety of methods and data to understand the housing market. Objective, measurable data were collected from the City, Brown County, the Multiple Listing Service (real estate listings and sales), the State of Wisconsin, the U.S. Department of Housing and Urban Development and the U.S. Census Bureau. The City is compared to surrounding communities and wider context (county, state, nation) in a variety of ways, and also compared to itself in the form of time-series data that reveal trends. This study also incorporated a series of interviews with people familiar with the housing market—the housing experts, and a community survey of area residents and employees.

Project Oversight

The study was initiated by the Redevelopment Authority of the City of Green Bay. City Staff from the Department of Community and Economic Development met four times during the study process: first in January 2020 for a kickoff discussion of issues and opportunities facing the City and region, then in February to prepare for interviews and the community survey, next for a presentation and discussion of the first draft of the study in August and finally for a public meeting presentation of the final plan in September.

Interviews

The project team met and interviewed a variety of people with knowledge and insight about the local housing market, including realtors, lenders, builders, landlords, students and employers. These interviews were conducted in May 2020.

The feedback collected in these interviews often gravitated to similar topics and viewpoints, reflecting a strong shared understanding of how the local housing market functions. This feedback is described in the following chapters. In a few cases the interviewees were not in agreement on a topic – these differing viewpoints are noted.

There was one question of particular interest that we asked near the end of every interview:

“What role do you see for the City to influence the housing market?”

A summary of noteworthy responses to this question follows, in no particular order:

1. Build neighborhoods near large employers. Although residential development may not traditionally be encouraged near industrial properties, creating homes near jobs so that people can walk to work will benefit everyone.

2. Find ways to hold landlords accountable for the quality and upkeep of their units.
3. Offer incentives that can be provided through the TIF Affordable Housing Extension. The City could give developers loans up front for utility extensions because banks often won't finance this.
4. Improve communication between City and housing experts/organizations in the community to identify opportunities and solutions to housing challenges.
5. Streamline the application approval process within the City to shorten the time between when developers submit an application and when they are able to begin development. When decisions are delayed until the last minute, developers lose money.
6. Encourage a variety of non-traditional housing types (tiny homes, mixed use).
7. Encourage development of market rate and affordable housing.
8. Focus on parks, trails and other amenities that people want in a community.

Community Survey

A community survey was conducted April 2020. The survey was offered online. In total the survey had approximately 968 responses, including 74 in the Spanish version of the survey. The survey was promoted via notices in the paper, social media, websites, and through email. The full responses are provided in Appendix B. Relevant findings are featured throughout the following chapters.

DEFINITIONS

The terms 'housing affordability', 'affordable housing' and 'workforce housing' are often used interchangeably, however they have different meanings. These terms are defined here to aid in understanding the analysis and recommendations in this study.

Affordable Housing

Affordable housing is housing that typically serves the lowest-income residents of a community. Generally this includes residents with no income up through residents making 80% the area median income. Income limits calculated by the US Department of Housing and Urban Development (HUD) give ranges for which housing market service levels are measured. The income limits for Green Bay are defined using the Green Bay Metro FMR (Fair Market Rent) area. Current 2020 Income limits for the Green Bay Metro area are shown in the figure below.

Funding for newly constructed affordable housing almost always comes from subsidies that offset costs of construction and/or operation. This allows rents to be set at a certain price that is manageable for low-income households based on the HUD income limits that come out every year. The price also takes into consideration families' other expenses such as food, childcare, transportation and healthcare. Other forms of affordable housing include:

- » Naturally Occurring Affordable Housing (NOAH)
- » Housing Operated by Non-Profits
- » Vouchers, Tax Credits, Other Federal Programs

		Low Income 80%AMI	\$46,100	\$52,700	\$59,300	\$65,850	\$71,150	\$76,400	\$81,700	\$86,950

Housing Affordability

Housing affordability is a measure of how much a person or household can spend toward total housing cost. This measure is relative to income, meaning that higher-income households have a wider selection of homes that would be affordable, while lower-income households generally have fewer affordable options within the housing market.

The widely accepted standard for affordability states that a household should spend no more than 30% of their gross income toward housing costs. This standard is the same for owners and renters. For renters this also includes utilities and renters insurance. For homeowners this includes principal, interest, taxes, insurance and utilities.

Income categories are calculated by HUD, and used to determine appropriate monthly housing costs across different regions. For the Green Bay Metro region, affordability limits are shown below. For example, in Green Bay a household earning 100% of the area median income could afford a \$307,400 home or a monthly rent of \$2,058. In contrast, a household earning 50% of the area median income could afford a \$158,200 home or a monthly rent of \$1,029.

Workforce Housing

Workforce housing is housing that is affordable to the workforce in a community. Because incomes within the workforce vary, a range of housing options is needed to fit the needs of the community. Workforce housing also means ensuring a supply of affordable housing for employee households that earn minimum wage—and ensuring appropriately priced housing for moderate to high-income earners in both the rental and ownership markets.

Variety in the housing stock is important, as households have a variety of preferences that impact where and how they can live. Important types of variety necessary to serve area employees include structure types, sizes, locations, and price points.

ABOUT GREEN BAY

CITY OVERVIEW

Green Bay is considered Wisconsin's earliest European settlement and was home to several indigenous peoples for hundreds of years before Europeans arrived. Both indigenous peoples and arriving white settlers used the waterways as a source of prosperity to grow and provide for their communities. The area is also crossed with abundant natural resource amenities, and Green Bay to this day is still a major shipping center through the Great Lakes. Some of the largest employers in the community are still in the paper and shipping/transportation industries.

Green Bay is currently undergoing a downtown transformation that is attracting people downtown to live, work and play. There are several new housing developments, and new opportunities for recreation, entertainment and employment that are part of this effort. This report discusses some of these recent/current developments and seeks to leverage the momentum of these efforts to ensure that the City has the housing current and future residents are looking for.

COMMUNITY BASICS

Green Bay is the largest city in Brown County and the third largest city in the State of Wisconsin. It is located on the shores of Lake Michigan, and surrounded by the communities of Allouez, Ashwaubenon, Bellevue, De Pere, Howard, and Suamico. Well connected within the region, Madison is a 2.5 hour drive, Milwaukee 2 hours, Chicago 3.75 hours, and the Twin Cities 4.5 hours.

The largest of all communities in the area, Green Bay is known for its football, lake views, and natural/recreational amenities.

One of the major tourist destinations in the State of Wisconsin, over 5.7 million tourists pass through the City and surrounding areas each year, with the number of visitors increasing on an annual basis.

Per the Green Bay Convention and Visitors Bureau, \$671 million is circulated into the local economy through tourism each year, generating \$43.5 million in local tax revenue that supports the City and County's ongoing operations and improvements.

POPULATION

Population within the region and the City itself has displayed relative consistency throughout the past decade. The City's secondary market (Allouez, Ashwaubenon, Bellevue, De Pere, Howard, Suamico) has shown a net population increase over the past 5 years, while the City itself has seen a net increase of 1,609 residents from 2010 to 2019. This represents a total percentage growth of 1.6%. This is the lowest growth percentage among communities in the secondary market that experienced growth over the past decade.

The growth pattern within the metro area indicates the City's loss of potential growth to other communities. The City's relatively low growth within strong regional growth suggests that the City could be attracting a larger share of the growth in people and housing than it currently is.

Population change is directly tied to change in the number of households and the size of those households, both of which are influenced by availability of desirable units within desired markets. Green Bay's data indicates increases of household size (larger households and households with children), without growth in the number of households.

Figure 3. Population Change

Source: 2018 ACS 5-Year Estimates

Municipality	2010-2019 Population Change	Percent Change Over Decade
Green Bay	1,636	1.6%
Allouez	-182	-1.3%
Ashwaubenon	-83	-0.5%
Bellevue	986	6.8%
De Pere	942	4%
Howard	2,281	13.1%
Suamico	1,389	12.2%

Figure 4. Population Growth Trends in Green Bay and Secondary Market

HOUSEHOLDS

Figure 5. Annual Change in Total Households in Green Bay and Secondary Market

Source: 2018 ACS 5-Year Estimates

Municipality	2010-2018 Household Change	Percent Change
Green Bay	-1,980	-4.24%
Allouez	-90	-1.61%
Ashwaubenon	253	3.31%
Bellevue	825	14.34%
De Pere	1,035	12.28%
Howard	1,352	19.9.3%
Suamico	713	17.62%

The estimate of total households within the City has shown a consistent slight decline each year since 2010. This relative consistency in number of households, combined with the slight population increase, runs contrary to larger national trends of decreasing average household sizes—which directly impacts demand for existing housing stock.

Larger family sizes and new family formation is a key factor in Green Bay's population growth, and indicates a strong base of not only families, but also youth that the City can work to convert into lifelong residents of the City over the next 20-40 years.

National trends show that most age groups are living in larger households now than they were a decade ago. This change is most transparent for adults age 35 and older. Between 2010 and 2017 there was a three percent increase in the number of adults age 35 and older living in households with at least three people. A common explanation for larger households among older adults is young adults who reside with their parents, but this could also be a parent of the householder or simply a roommate.

Figure 6. Household Trends in Green Bay and Secondary Market

Source: 2018 ACS 5-Year Estimates

AGE COHORTS

Age trends are used to help predict current and future needs of the community—especially needs related to recreation, education, and service amenities (e.g. daycare).

As people continue to age, or add members to their households, their needs change as well. Since 2010, the City has seen an overall increase in population. Some age cohorts such as older children (10-19) and middle-aged adults (40-49) have decreased as students move off to college and households relocate.

There has been an increase in persons aged 20-29 and 30-39, a typical age for the formation of family households that would factor into the increase in young children (0-9). The other age range displaying a large increase is those at retirement age, from 60-69 years old. These households likely aged into this category over the decade, which is consistent with general trends of aging in the County, State, and Nation as baby-boomers reach retirement. Older households have, or will have, unique housing needs.

Figure 7. Annual Change for Age Cohorts in Green Bay

Source: 2018 ACS 5-Year Estimates

Green Bay	Total Change 2010 -2018	Percent Change
0-9	548	3.69%
10-19	-1,023	-7.01%
20-29	707	4.36%
30-39	313	2.17%
40-49	-2,440	-19.16%
50-59	-61	-0.47%
60-69	2,414	32.25%
70-79	322	6.88%
80-85+	-98	-2.62%
Total Change	761	0.7%

Source: 2018 ACS 5-Year Estimates

POPULATION PROJECTIONS

Green Bay's future population growth has been projected by the State Department of Administration (DOA). DOA projections can be used to predict future demand for community resources, housing, and municipal projections of service levels.

Currently the third largest City in the State, Green Bay does not have the same growth rate projection as other similarly sized communities and is not projected to maintain its population rank in Wisconsin. Kenosha is projected to surpass Green Bay's population by 2040 to become the third largest city in the state.

DOA projections are based on historical trends, and market forces and local policy can have a large impact on the long-term accuracy of these projections. As Green Bay has seen housing market-share loss to bordering municipalities, there is potential that a strategic investment in housing opportunities within the City could shift these projections.

The community survey administered through this study indicated that mid-tier housing is in short supply, and that younger people are more interested in moving to Green Bay after college but find homeownership out of reach. The apartment market is currently "tight", with a low vacancy rate which decreases opportunity to attract residents while increasing housing costs in a competitive market.

Figure 9. Population Projections for Green Bay

Source: WI Department of Administration

Green Bay Population Projections	2025	2030	2035	2040
DOA Projection	111,200	113,850	114,700	113,500

Source: ACS 5-Year Estimates, WI DOA Projections

HOUSEHOLD PROJECTIONS

Figure 11. Household Projections for Green Bay and Secondary Market

Source: 2018 ACS 5-Year Estimates

Projecting Green Bay's future households is tied to both future population projections as well as future anticipated persons per household as demographics change and people age. Across the nation, reductions in household sizes are expected to continue through at least 2040. This is indicative of populations continuing to age, dependents leaving their family households and most likely creating their own, and longer formation periods for young-family households than existed in prior decades. Young adults are not getting married as soon and are waiting longer to start families. Projection methods for the City show a steady rise in households in Green Bay and a more rapid increase for the secondary market.

EMPLOYMENT INDICATORS

Place of residence often coincides with location of a person's job, though we also expect to see a high degree of mobility within a metropolitan area. The figure on the right represents inflow and outflow of the City's workforce. The number of people that work in Green Bay is about 66,000. Of this 66,000, 46,245 live outside of Green Bay and 20,197 live in Green Bay. The second highest place of residence for workers in Green Bay is Ashwaubenon, which is not surprising as it is close to Green Bay's downtown and business park. There are 32,275 people who live in Green Bay but work in another community.

The data also shows that people from Madison, Milwaukee and Appleton commute into Green Bay for jobs. There is a large number of workers from "All Other Locations" which includes workers who live in unincorporated areas and other small towns beyond the municipalities of the Green Bay Metro Area.

Figure 12. Inflow/Outflow Analysis in Green Bay

All Other Locations	13,628

EMPLOYMENT INDICATORS

Figure 14. Commute Times for all Workers in Green Bay and Secondary Market

Source: 2018 ACS 5-Year Estimates

Commute times in Green Bay and the secondary market are fairly low, with the majority of workers commuting in under 24 minutes. People will drive further for a job if they cannot afford housing or find desirable housing in the community where they work.

Top Employers

Brown County and the City of Green Bay have a diverse economy with many opportunities for workers of all ages. The major industries in Green Bay are Education & Health Services; Trade, Transportation & Utilities; Manufacturing; and Professional & Business Services. There are 11 post-secondary establishments (schools) in Green Bay. These industries and top employers below provide opportunities

for workers. This is why employment indicators are essential to housing. If there is not lower cost housing available for workers, they are less likely to stay in Green Bay, or come to the city. Having the housing workers at these employers are looking for is essential to the vitality of Green Bay's economy.

INCOME TRENDS

Income and Earnings are key factors in housing affordability. The more income that a household earns, the more housing options that fall within their affordability threshold. A household that spends more than 30 percent of its income on housing is considered housing burdened. While incomes are mobile, meaning households can move from place to place, the physical structure of a housing unit is stationary. In practice this typically means that households often commute, choosing to live wherever they find the acceptable balance among convenience, quality, local amenities, and affordability.

As compared to communities in the secondary market, Green Bay has the lowest median income, \$47,797, and the second lowest per capita income, \$32,612. When comparing the County and the City, a much larger percentage of households in the City have incomes under \$50,000.

Figure 16. Income Trends for Green Bay

GENERAL HOUSING CHARACTERISTICS

OVERVIEW

This section of the plan begins to explore characteristics of the housing market—housing type, age, permits, and occupancy. These are important categories to set a baseline for current and future growth potential to provide the best quality of life for current and future residents.

In brief, the majority of housing in Green Bay and the secondary market communities are single family detached homes. Green Bay's housing stock tends to be older, with the majority of single-unit ownership homes built before 1969. Secondary market communities of Allouez and De Pere display similar unit age rates, while the remainder of the secondary market offers newer housing options as their primary market. However, in more recent years new housing starts in the City have increased, offering more options to people looking for newer homes.

HOUSING TYPE BY UNIT

A housing “unit” is a single living space—either standalone or as part of a larger structure. The most common structure type in Green Bay and the secondary market communities is detached single-unit homes, commonly referred to as single-family.

The second most common structure type in the City is 5- to 9-unit structures (small apartment complexes), followed by 2-unit (duplex/twinhomes). These types of units serve an important purpose in providing choices within a market, allowing residents options as to how and where they would like to live.

YEAR STRUCTURES BUILT

Year of construction as shown in the graph below indicates the age of homes as estimated by the US Census Bureau. Almost one third of all residential units (30%) in Green Bay were built between 1960 and 1979, which is similar to Ashwaubenon, Allouez, and Brown County as a whole.

In the communities of De Pere, Bellevue, Howard and Suamico, the most common date of construction is from 1980-1999. Since 2000, construction appears to have decreased in Green Bay, a finding that is consistent across communities in the secondary market and is indicative of older average housing stock age in established communities.

The age of a home or apartment building is not, by itself, an adequate measure of quality or condition but can be used as an indicator. Older homes tend to have poor energy performance, higher maintenance costs, and sometimes lack things homebuyers desire such as attached garages. If not maintained, these older homes may not be desirable to potential buyers. Even if maintained, some buyers may not be interested in/able to do the maintenance and upkeep required of an older home. Focus group interviews confirmed that housing is generally older in Green Bay and in need of rehabilitation.

BUILDING PERMITS

Building Permit data allows a real-time trend of new construction starts in Green Bay. Post-recession starts in the City were consistent with larger national trends—primarily slow growth in housing construction, but continuing to climb year-to-year.

Single-unit starts have shown a steady, consistent increase over recent years before decreasing in 2019. However, for the existing housing stock there has been a dramatic increase in alteration permits after steady, slow growth from 2014-2018.

As much of Green Bay's housing stock is older than surrounding areas, this indicates alteration and upkeep to stock that can better serve the needs of residents.

New construction of single-unit homes takes two forms within the City—either on previously undeveloped land, or through the replacement of older homes that have been “razed” (demolished).

New homes that replace older homes are represented in the building permit data in the category of “Raze Single Family Home”, which suggests significant single-unit redevelopment projects occurring on an annual basis. Permits for new multi-family properties remained low from 2014-2018 with some small building projects. In 2019 that number grew to nine in both categories of 3-4 family building and 5+ building. Alterations to multi-family buildings has stayed consistent at about 20 per year.

Figure 24. 3-4 Family Building and 5 or More Building Permits

Source: City of Green Bay

Figure 25. Total Number of Building Permits

Source: City of Green Bay

CROWDING

Crowding data is used to display the relationship between housing unit size (number of bedrooms) and household size (number of people). Households that average more than 1 person per room or 1.5 persons per room are considered to be “overcrowded” or “extremely overcrowded”, respectively.

Despite the City’s increasing household size, more than half of renter- and owner-occupied units have 0.5 or less occupants per room—they occupy homes that have excess space for their needs. This is consistent regionally within secondary market communities as well, and indicates that the City’s housing stock is in good position to accommodate growing family households.

Figure 26. Owner Occupied, Occupancy Per Room

Figure 27. Renter Occupied, Occupancy Per Room

Source: 2018 ACS 5-Year Estimates

RENTAL MARKET

OVERVIEW

Within the City, 44% of the housing stock is rental units. Rental units include a variety of housing types – single-family homes, duplexes, condos and multifamily residential units.

AFFORDABILITY

Household income is key to discussions about housing affordability, as income determines purchasing power for households. Using HUD's income limits, Figure 29 shows the general monthly rent a household could afford without becoming housing cost burdened (more than 30% of gross income paid toward rent). The rents vary based on household income and household size. For a household of four earning 100% of the median income, a monthly rent of \$2,058 is considered affordable (this includes utilities).

Figure 28. Housing Occupancy in Green Bay

Source: 2018 ACS 5-Year Estimates

Figure 29. Affordability Thresholds for Renters in the Green Bay Area

Source: HUD 2020 Income Limits

Green Bay, WI HUD Metro FMR Area	Maximum Monthly Housing Cost (100% Area Median Income)	Persons in Family						
		FY 2020 Income Category	1	2	3	4	5	6
	\$2,058	Extremely Low (30%) Income	\$ 433	\$ 495	\$ 556	\$ 655	\$ 767	\$ 879
		Very Low (50%) Income	\$ 721	\$ 824	\$ 926	\$ 1,029	\$ 1,111	\$ 1,194
		Low (80%) Income	\$ 1,153	\$ 1,318	\$ 1,483	\$ 1,646	\$ 1,779	\$ 1,910

HOUSING STRESS

A cost burdened household is a household which pays more than 30% of its income to housing costs. Generally when a housing market is “tight”, or competitive, this drives costs up for consumers and also increases cost burden. This is true in Green Bay, as overall rates of rental housing cost burden are high, similar to many communities in the secondary market. Of those experiencing cost burden in the City, 34% are severely cost burdened (greater than 50% of income toward housing costs). Cost burden for renters is greater in Green Bay than surrounding communities. Similar to most other communities, cost burden is also greater for renters than it is for homeowners, which is a reflection of lower renter incomes, barriers to securing financing (in addition to lower incomes) and other market forces.

Cost burden in the City exists primarily with households at or below 50% median income, those considered very

low or extremely low income. This signifies that the supply of rental units in the City has gaps in unit availability at the appropriate price points to serve this income group. There is a significant housing gap at the very bottom of the rental market, an undersupply of 3,715 units for those at 30% or less median income. This indicates an opportunity to better serve low-income households through income-restricted and subsidized units that ensure affordability levels not currently provided by the market.

There is a surplus of units (8,870) available at 31-50% median income. There is a shortage of 1,285 units for households between 51-80% median income, and a fairly significant shortage in units for those at greater than 80% median income (3,385 units). This indicates an opportunity to add higher-rent, high-quality rental units to the market.

	Rental Units Available	Renter Households	Over-/Under-Supply
0-30% AMI	2,720	6,435	(3,715)
31-50% AMI	12,745	3,875	8,870
51%-80% AMI	3,450	4,735	(1,285)
>80% AMI	290	3,675	(3,385)

RENTAL UNIT CONSUMPTION

The US Census and HUD assess how many households are over- and under-consuming housing. The previous figures in this chapter have suggested that higher-income households have been renting down in the market when securing housing, but what units are they actually occupying? Figure 34 shows that 9% of households above 80% median income are renting units affordable at 30% median income, 17% are renting units affordable at 50% median income.

Green Bay also has the reverse happening, households at lower incomes are renting beyond what is considered affordable to them. For households earning less than 30% median income, 33% are renting units affordable at 50% median income, 18% are renting units affordable at 80% median income and 9% are renting units affordable at greater than 80% median income. When households rent units that are more expensive than what they can afford, cost burden increases.

Adding more choices at appropriate price points will help guide consumers to desirable housing that can decrease

cost burden among renters within the community.

The most common response among renters in the community survey in regards to important factors in deciding where they live was cost (74%). Just over 50% of these renters responded that in the past five years, they have had to forego other needs such as food, healthcare or childcare to continue to pay for housing. This further highlights just how big an issue affordability is within the City and that there is a need for more rental units.

Thirty-five percent (35%) of the renters who took the survey said if they were to move in the future they would look to rent housing, the remaining 65% would be most interested in ownership options (both conventional and condo). So in addition to focusing on providing more affordable rental units, there should be a focus on more affordable ownership units so those options are available too. The primary barriers to purchasing a home for renters who took the survey were lack of downpayment (69%), monthly payment would be too high (57%), and too much existing debt (44%).

UNIT TYPES

There are different types of rental units available to provide choices in the housing market to meet the needs of current and potential residents in Green Bay. Fifty-one percent (51%) of rental units within the City are found in smaller building types—single-family homes, duplexes and tri- or quadplexes. Very few of the City’s apartment units are found in buildings with more than 20 units (16%). Single-family and duplex home rentals are becoming increasingly popular due to the difficulty many people have in providing a downpayment or securing loan funding to purchase a home. We estimate that there are approximately 3,200 single family detached homes in Green Bay that are rented (see map on the following page). These units offer an opportunity for people interested but unable to purchase a home, but with a tight supply of these homes, rents continue to increase.

Figure 37 indicates the number of bedrooms available in Green Bay’s renter-occupied housing units. Green Bay has the highest number of 2-3 bedroom units (21,530 total, 63% of rental stock) compared to secondary market communities. The community with the next highest number is De Pere at 2,380 units (60%) its rental stock. Something that came up repeatedly in focus groups is that there is a need for rental and owner units for families with 3 or more bedrooms.

Green Bay also has the highest number of efficiency and one-bedroom units (9,794, 28% of housing stock) compared to the secondary market. The community with the next highest number of efficiency and one-bedroom units is Ashwaubenon at 1,159 (32% of housing stock). These smaller units are often the most affordable rentals available to the community.

COST

For renters who took the community survey, 74% said that cost was an important factor when deciding to live at their current residence. Data shows that median rent in Green Bay is lower than all secondary market communities and Brown County. When compared to the median income in Green Bay, the median rent of \$701 would be considered affordable to a household earning \$28,040. Current median household income for renters in Green Bay is \$30,605. Thus, for a hypothetical household earning median income could afford more than 50% of the rental units available in Green Bay. Despite Green Bay having relatively low housing costs compared to surrounding communities, there is a concern of quality of units due to age. This was something that came up in both focus group interviews and the community survey.

Median rents by bedroom also indicate that Green Bay is relatively less expensive than surrounding communities. Ranges of rental unit price show that most units rent for between \$500 and \$999. A \$1,000 price point for rental units is the limit of affordability for a household earning \$40,000 annually. A very small number of units rent for \$1,500 or higher, a reflection of the aging housing stock and lack of new units that have been built recently.

VACANCY

Vacancy rates are an important measure of the balance between housing demand and supply in a community. A typical healthy vacancy rate for renters is around 5%. This number is typically higher than the homeowner vacancy rate because rental units are more likely to sit vacant between renters. A rental vacancy rate around 5% is an appropriate balance between supply and demand, with enough available units to offer renters choice and the ability to move in somewhere right away. If the rental vacancy rate falls, it is harder for renters to find units and easier for landlords to raise rents.

The 5-Year ACS estimates for vacancy rates contain a significant margin of error (greater than 20% for Green Bay and secondary market communities), so numbers should be reviewed cautiously. Green Bay's rental vacancy rate is 3.8%, which is slightly lower than desirable. This estimate might not be too far off; a number of focus group participants noted that supply for rental units is tight and it's hard for renters to find desirable units. Increasing supply and increasing the rental vacancy rate in Green Bay would be healthy for the housing market—this would give more choices for potential residents who are looking to move to the City, and provide more options for current and future residents to self-select into housing that is appropriate in size and price point.

Figure 41. Rental Vacancy Rates

Source: 2018 5-Year ACS Estimates

Note: The 5-Year ACS estimates for vacancy rates contain a significant margin of error (greater than 20% for Green Bay and secondary market communities), so numbers should be reviewed cautiously.

SIZE

Household size is important to the housing market, as larger households require units with more bedrooms so as not to be overcrowded (more than one person per room). Smaller units, efficiencies and one-bedroom units, serve to provide the most affordable option for households with one to two people. Currently, 3% of rental units in Green Bay are considered crowded. While renter households generally have smaller household sizes, Green Bay growth trends have shown increasing household sizes over recent years. The size of renter households increased from 2.16 (2010 5-Year ACS) to 2.21 (2018 5-Year ACS) during the nine year timeframe. The continued need for larger apartment units is reinforced by focus group participants who noted there is a lack of units with three or more bedrooms in Green Bay.

Within the City, 19% (3,544) of rental units contain three or more bedrooms. Considering increasing household sizes, this submarket will remain an important component to new development in the City. According to 2018 5-Year ACS estimates, 29% (5,445) of renter-occupied housing units have household sizes of three people or more. This indicates there is a shortage of approximately 1,900 units with three or more bedrooms. This shortage of “family units” is further reinforced by the 46% of renter households who have at least one child under the age of 18 (2018 ACS).

Figure 42. Renter Occupied Units by Bedroom in Green Bay

Source: 2018 5-Year ACS Estimates

AGE OF STOCK

Green Bay's rental market consists of a variety of housing types with different time periods of construction. Approximately 64% of the City's rental housing stock was built before 1980, and 17% was built 1939 or earlier. Older units are typically more affordable to renters, while newer units offer opportunities to rent at a higher price point. See the following page for location of multi-family units by age. The majority of the oldest units are located near downtown, while the newer units are located further out.

Older units in the City that are rental units have limited risk of contaminants such as lead-based paint, however

other health concerns come with age and compounded disrepair. Of respondents who took the survey, 63% of renters viewed their rental units as in either "excellent" or "good" condition. Although only 9% of renters stated the condition of their units was "poor", anecdotal evidence from focus groups supported the idea that there is a lack of desirable rental units in the City. In particular, concerns about quality and livability of units is greatest for households who are low income and have few rental options available/landlords who are willing to rent to them.

Brown County, WI**

DEVELOPMENT EXAMPLE

The following analysis shows estimated costs for a new one-bedroom apartment in Green Bay. Costs include construction costs, taxes, operating expenses and reserves for maintenance and vacancies. A break even monthly rent for this unit would be \$1,280. The table at the bottom of the page shows that this unit would not be considered affordable for very low and extremely low-income households in Green Bay. If underground parking were

added into the cost of this unit, the monthly break even rent is \$1,660. This is not considered affordable for any low-income household.

If not subsidized to lower rents, new construction can offer expanded housing opportunities for those with higher levels of income, which can free up housing at lower price points.

OWNERSHIP MARKET

OVERVIEW

Owner-occupied units comprise 56% of all units within Green Bay. The most common type of ownership property is single-family homes (91% of all owner occupied units). Other less common owner-occupied unit types include duplexes, townhomes (often condominiums) and mobile homes.

Figure 46. Owner-Occupied Housing Units by type for Green Bay

Source: 2018 5-Year ACS Estimates

Condominium Ownership:

A group of housing units where homeowners all own their individual unit space and share ownership of common use areas and/or building elements. The individual units typically share a wall.

AFFORDABILITY

Household income is key to discussions about housing affordability, as income determines purchasing power. Using HUD's income limits, the table below shows the general purchase price a household could afford without becoming housing cost burdened (more than 30% of gross income paid toward housing). These amounts vary based on household income and household size. For a household of four earning 100% median income, \$82,300, a purchase limit of \$307,400 is considered affordable. Assumptions under this scenario are for a 30-year fixed mortgage and assume a \$10,000 downpayment, a 3.958% interest rate, home insurance, PMI (private mortgage insurance) and a 1.2% property tax.

The majority of owner-occupied homes in the City are occupied by households earning above the area median income. This is not an uncommon occurrence, as increased

income opens up increased ownership opportunities and eases costs associated with homeownership. Figure 48 shows that the majority of homes sold in Green Bay in 2019 were affordable to median income households, again confirming a generally older, more affordable housing stock.

While a majority of homeowners earn more than 100% median income, 39% of home owners are considered low-, very low- or extremely low-income. Often these populations are aging homeowners who have entered retirement and have seen significant loss in income, which brings new challenges. Although these owners may own their homes free and clear, they often struggle with property tax payments, upkeep and other factors of homeownership that require continual maintenance funds and/or physical requirements.

HOUSING STRESS

Generally when a housing market is “tight”, or competitive, this drives costs up for consumers and makes it harder for households without downpayment savings. As compared to renter households, owner-households typically experience cost burden less frequently. This can be explained by a couple of factors—including homeowners earning higher incomes and 32% of homes being owned free and clear (no mortgage). Homeownership also has barriers to entry, so people must qualify to buy by meeting underwriting standards. These standards serve to minimize risk by ensuring adequate income, increased access to credit, etc.

When compared to the secondary market, Green Bay experiences higher cost burden among homeowners (26%) than all communities with the exception of the Village of Howard (28%). Of those experiencing cost burden in the City, 33% are severely cost burdened (greater than 50% of income toward housing costs).

Cost burden in the City exists primarily with owner households at or below 50% median income, those considered very low or extremely low-income. Although cost burden is more prevalent for these lower-income households, there is an oversupply of 9,515 homes available at the 0-50% median income threshold, likely due to the age of the housing stock.

There is a significant shortage at the upper end of the owner market, an undersupply of 11,685 units for those at greater than 80% median income. This indicates an opportunity to provide more moderately- and higher-priced housing that is affordable and desirable to these income groups. Those homebuyers with higher incomes are therefore competing with lower-income households for homes that those with lower incomes could otherwise afford. When higher-income households compete with lower-income households, they have the financial flexibility to offer more money or better terms to sellers, forcing lower-income households to look elsewhere or to rent housing instead. The competition for units and lesser options at lower incomes can be a frustration for renter households who are hoping to buy into owner-occupied housing.

Of the renters who took the community survey, 39% said they were planning on purchasing a home somewhere in the next 2-3 years and 28% were unsure whether they would. Most respondents who said they would likely purchase a home had downpayments of no more than \$20,000. This further emphasizes the importance of having affordable homes ready for when renters decide to move into owner-occupied housing.

>100% AMI	1,460	11,185	(9,725)

HOMEOWNERSHIP UNIT CONSUMPTION

The US Census and HUD assess how many households are over- and under-consuming housing. The previous graphs and tables in this chapter have suggested that higher-income households have been purchasing down in the market or looking outside of Green Bay when securing housing, but what units are they actually occupying? Figure 52 shows that 50% of units affordable at 50% median income are being purchased by households earning greater than 80% median income. These homes are affordable to higher-income households and provide desirable ownership options for high-income earners. However, it does provide increased competition that precludes lower-income earners from entering the ownership market.

Green Bay also has the reverse happening, households at lower incomes are purchasing beyond what is considered affordable to them. 7% of units affordable at 100% median income or greater are being purchased by households at or below 50% median income. However, the ownership market is primarily dominated by households earning over 100% median income. These households are generally under consuming in the housing market—the percentage of their income spent on housing costs is extremely

low. While this is beneficial to individual households, it strains the market and ultimately increases sale prices in all housing price ranges and removes more affordable housing options for lower-income households. Affordable home ownership was confirmed as one of the top unmet housing needs in Green Bay right now in the community survey and focus groups.

Overall, 32% of ownership units in Green Bay are units without a mortgage (assumed to have been purchased 15 or more years ago). Of the 32%, 54% of these units are owned by households considered low-income. This reflects the prevalence of low-/fixed-income retirees among those who own a home without a mortgage. A number of these aging homeowners are staying in place, at least for the time being, which puts a strain on the available housing stock as new residential construction has lagged behind demand. This is confirmed by ACS estimates that show 58% of owners without a mortgage are 65 years and over. Forty-one percent (41%) are those age 35 to 64, some of whom will choose to age in place and others will search for other housing options in the community (such as apartments or smaller homes) as they get older.

HOUSING COST

An important aspect of the housing market study is the cost of supply. The figure below indicates the median value for owner-occupied units, as estimated by the ACS. While cost and value are not strictly synonymous, in the housing market they are typically aligned. This figure shows that compared to the secondary market, housing in the City is relatively affordable at the low end of the regional market. This does not reflect the cost of new housing units in particular (built since 2018).

Green Bay's housing values decreased by approximately 5% between 2010 and 2017 and finally increased in 2018 back to just below what the median value was in 2010 (\$132,900 compared to \$132,500). This can be explained by a lack of new construction and an aging housing stock. The increase in median values is explained by an increase in price simply due to demand outstripping supply.

Increasing housing value despite an aging housing stock was something that was discussed as a housing issue in several of the focus groups. Cost was also the number one response when homeowners were asked in the community survey what the most important factors were in the decision to live at their current residence.

Note: ACS estimates are based on a sample polling of homeowners, so these estimates do include error. Housing price data from the Multiple Listing Service (MLS) is based on actual sales data and will be presented on the next two pages.

Figure 54. Median Value of Owner Occupied Housing Units in Green Bay and Surrounding Communities

Source: 2018 5-Year ACS Estimates

MARKET TRENDS

Detached Single-Family Homes

When comparing housing values to sale prices of detached single-family homes on the Multiple Listing Service (MLS), these trends also show that the median sale price for homes in Green Bay has increased over the past 5 years by 28% in Green Bay. This closely tracks the increase in Brown County during the same time period (29%). Despite the increase in median sale price, the total number of sales for single family homes has remained relatively constant (a decrease of 1% between 2015 and 2019).

The average days on the market for homes in Green Bay between 2015 and 2019 decreased from 99 to 67, reinforcing the tight supply that is occurring. With a tight supply, homes are typically not on the market for long and multiple buyers often put in offers on the same home.

Average months of supply is a good indicator of how balanced the housing market is. Six months of inventory is generally considered a balanced housing market. In 2019 Green Bay had three months of inventory, the same as Brown County.

Attached Single-Family Homes

Attached single-family housing is single family housing that shares a wall or walls with another homes (e.g. townhomes and rowhouses). This type of housing makes up only about eight percent of Green Bay's housing stock. Consequently, attached single-family home sales are low. Only 27% of the existing attached single-family stock is currently owner-occupied, this is also a contributing factor to low turnover. Total sales of attached single family units between 2015 and 2019 was just 25 sales, though sales did decrease to only two units in 2017. The median sale price has also remained unchanged in Green Bay between 2015 and 2019. The median sale price in the County increased by 83.7% during this time period. This is likely due to the relatively large impact new units have on the small pool of this unit type, but could also be due to increased demand. Responses to the community survey indicated that 7% of respondents would be interested in attached townhouses/rowhouses if they were to move in the future.

Figure 55. Detached Single-Family Home Sales in Green Bay and Brown County

Source: Multiple Listing Service

Figure 56. Attached Single-Family Home Sales in Green Bay and Brown County

Source: Multiple Listing Service

MARKET TRENDS

Duplex/Twindo Homes

Duplex/twindo homes comprise about 15% of Green Bay's housing stock. Accordingly, they also make up a small number of home sales in the City, though the total sales has increased in recent years. Between 2015 and 2019 the number of duplex sales increased from 92 to 123 (an increase of 34%). During the same time period, median sale price increased by 20% (from \$117,100 to \$139,900).

Other indicators of balance in the market for these types of unit include days on market which decreased from 96 in 2015 to 76 in 2019. Total months of supply remained unchanged during this time period.

Although this is a relatively small percentage of the housing stock, real estate data indicate that there is increasing demand for these types of units. Eight percent of respondents to the community survey indicated they would be interested in living in a duplex if they were to move in the future.

Condos

Condominium is a type of ownership. It's similar to a traditional single-family home in that the owner owns the individual unit, however there is joint ownership with other condo owners for common grounds, hallways, etc. The physical type of structure where condominium ownership is most commonly found is in attached single-family homes and multi-family buildings.

Between 2015 and 2019, condo sales in Green Bay remained relatively stable (55 in 2015 and 51 in 2019). Despite a stable number of sales, prices have gone up 42 % between 2015 and 2019. Average days on market also significantly decreased from 171 to 82 days (52% decrease) from 2015 to 2019. This was more severe than the decrease in Brown County (120 to 86 days, a decrease of 28%). Months of inventory was six in 2015 and then decreased to three in 2016/2017 but went back up to six in 2019. Months of supply is slightly lower in Brown County (five months).

These indicators in the condo home sales market indicate that there has been increased interest in condos in recent years. Responses to the community survey confirm this finding—16% of respondents said if they were to move in the future they would be interested in condo ownership.

Figure 57. Duplex Home Sales in Green Bay and Brown County

Source: Multiple Listing Service

Figure 58. Condo Home Sales in Green Bay and Brown County

Source: Multiple Listing Service

OWNERSHIP UNIT SIZE

The most common bedroom size for owner-occupied units within the City is three bedrooms (56%), followed by two bedroom (20%) and four bedroom (20%) units. Ownership units are typically larger in size than rental units, which is a large part of their appeal to families. Of those homeowners who took the community survey, 34% said they have one or more children under the age of 18 living in their household,

and 18% said they have children or dependent adults over age 18 living in their household, this is actually 2% less than renters who responded to the survey. It's important the City provides ownership housing that can support both families with children and without.

Source: 2018 5-Year ACS Estimates

HOUSING FOR SPECIAL POPULATIONS

OVERVIEW

This section further investigates the special populations of Green Bay and the secondary market — the student population, disabled population, homeless and the elderly. Ensuring adequate housing for all of these groups is important to the overall health of the housing market in Green Bay. The unique housing needs of these populations are often overlooked, yet these needs grow in proportion to overall population growth.

Northeast Wisconsin Technical College Housing

HOMELESSNESS

Figure 60. Green Bay School District Homeless Student Enrollment

Source: Wisconsin Department of Public Instruction

Youth Homelessness is tracked at family level by school districts in Wisconsin and the Wisconsin Department of Public Instruction. Different than traditional measures of homelessness which look at individuals both unsheltered and in transitional or emergency shelter, youth homelessness is a measure of housing instability. The definition of homelessness as tracked by educational institutions includes students who lacked a permanent nighttime residence. While these students are often not in the shelter system, they have an unknown place of residence on a nightly basis, often staying in hotels on a temporary or permanent basis or “doubling up” with other families temporarily.

The number of homeless students in the Green Bay School District has, overall, risen in the past eight years. This is an indicator of a tight housing market as instability, especially inability to find and afford rental units often forces individuals to find shorter-term options for their families. This is often temporary until more secure housing is located. The school district serves the City of Green Bay, Village of Allouez, Village of Bellevue, Town of Scott, parts of Ledgeview, Eaton and Humboldt. Surrounding area school districts have experienced an increase in homeless youth in the past 3 years as well.

Anecdotal feedback from the focus groups indicates that organizations working with the homeless are seeing an increase in young adults (age 17-30) because homelessness

Figure 61. Surrounding Community Homeless Student Enrollment

Source: Wisconsin Department of Public Instruction

is cyclical. Children growing up in homeless households often don't know how to sustain stable housing once they transition from a homeless shelter into housing because they have not grown up in a household with stable housing.

When looking at the wider population, the Brown County Homeless and Housing Coalition serves about 500 people per month. There are an additional 200 single people (not including families) on waiting lists at any point in time. In June 2020, there were 798 homeless clients served in Brown County. This is up 34 clients from a year ago. Sixty-one of the clients in June 2020 were new clients, 13 were returns to homelessness and 54 were exits to public housing. The number of new clients entering the homeless

system dropped from 102 to 61 between June 2019 and 2020. Of these 798 homeless clients served in June 2020, 30% were children (under age 18). Over half (59%) were white, 26% black, 12% American Indian and the remainder other races.

There are a variety of reasons a person may be homeless, many of which are not directly tied to housing availability, such as poverty, unemployment, physical or mental health issues, drug or alcohol abuse, domestic violence and abuse. However lack of affordable housing can contribute to homelessness, so it is important to consider the homeless population in Green Bay.

Figure 62. Brown County Total Homeless Clients Served, May 2019–April 2020

Source: icalliances.org/monthly-dashboard-wi

How has the total number of clients served changed over time?

Figure 63. Brown County New Clients Entering Homeless System, May 2019–April 2020

Source: icalliances.org/monthly-dashboard-wi

How has the number of new clients entering the homeless system changed over time?

A chronically homeless person costs the taxpayer an average of \$35,578 per year. Costs on average are reduced by 50% when homeless are placed in supportive housing. Supportive housing costs on average \$12,800 per year.

-National Alliance to End Homelessness

AGING POPULATIONS

The elderly population is an important factor in housing as many are current homeowners, and some will require different accommodations, specialized housing, or programming to assist aging-in-place. Senior housing generally refers to the combination of services and housing that allow them to continue to live comfortably. This ranges from continuing to live in their own home with virtually no services, to townhomes and apartments that offer the ability to “downsize” their residence, specialized housing units with limited services, and different types of assisted living facilities.

There are three popular types of senior-specific housing: 1) Nursing Homes—primarily for adults with serious medical needs. 2) Assisted Living facilities—offer residents the ability to live a free and independent lifestyle, but they also receive regular support for a range of daily activities, from cleaning to meal preparation to medication management. Residents are also offered a calendar of special events, activities, trips, and many opportunities for social engagement. 3) Independent living facilities—ideal for individuals who can still live independently but enjoy having access to assistance when needed/desired such as dining, medical care and entertainment.

Within the greater Green Bay area there are five nursing homes offering 405 beds, 12 assisted living facilities offering 749 beds and 12 independent living complexes (5 are income restricted). Rents at the independent living complexes fall into the following ranges :

- Studio: \$890–\$2,050
- One Bedroom: \$345–\$2,500
- Two Bedroom: \$585–\$2,850

As varying levels of services are included with different types of housing for aging populations, typical affordability standards do not apply. Often senior households will pay up to 50% of their income for market rate senior housing, up to 90% of their income for specialized and assisted living, often funded in part through sales of an owned home. Many households age 62+ in the City are still homeowners (71%). Over the next 20 years, nearly 15,000 residents will age into the 80+ age category, and may look to sell their housing for other living options. Selling homes as people age is not an easy task. As the housing tenure data on the next page shows, home ownership peaks around age 70 and many desire to stay in their current home as long as possible. This suggests a need for services to enable that objective while maintaining and adapting existing housing.

81-100%	1,120	160
>100%	2,690	315

77% of respondent to the 2018 AARP Home and Community Preferences Survey (age 50+) state they would like to remain in their community for as long as possible.

76% would like to remain in their current residence for as long as possible.

Figure 66. Housing Tenure by Age in Green Bay

Source: 2018 5-Year ACS Estimates

DISABLED POPULATIONS

Persons with a disability do not inherently require access to specific housing types or accommodations. It is dependent on the type and severity of the disability. More commonly persons with a disability receive services and accommodations as they continue to age and require more specialized forms of housing. This is due to the percentage of population by age, that experience a disability being disproportionately higher in aging and senior housing holds which is not fully the case in Green Bay, as a higher portion of younger and middle age adults have a disability.

Wisconsin DOA projections show that there will be a 63% increase in those age 70-79 by 2040. A 2007 study by Smith et. al. published in the Journal of the American Planning Association projects that due to the aging population, 21% of all households will have at least one disabled resident in 2050. They also estimate there is a 60% likelihood that a newly built single-family detached unit will house at least one disabled resident during its expected lifetime. Because many seniors desire to live independently for as long as possible, this suggests a growing need for housing that is accessible.

When housing units are constructed specifically for persons with disabilities, they are not traditionally built using methods that easily accommodate aging populations and often require renovation such as wider doorways, lower counter tops, zero entry shower/baths. However, many municipalities have requirements that mandate a percent of new construction be built using universal design standards. These standards often not only provide access to persons with and without disability, but are cheaper to construct on a per unit basis.

ACCESSIBILITY

Income and disability current trends in the City show that households including someone living with a disability are found across all income levels, including levels that would find market rate housing affordable. Lower-income households tend to have disabilities go unreported or undiagnosed due to limited access to affordable healthcare. There is no reliable data on local units that are accessible, though estimates nationally place accessible single family homes at just 1% of the total housing stock

in the country. The high number of those with a hearing or vision disability at 0-30% median income is slightly concerning, but many times their assisted housing needs are not as structural as those with ambulatory disabilities. The 1,135 households under 50% median income with ambulatory disabilities are most concerning because they are at the highest risk for homelessness because of their incomes and also have the greatest need for accessibility features, which many likely do not have .

STUDENT POPULATION

Figure 71. UW Green Bay Student Enrollment

Source: University of Wisconsin Green Bay

University of Wisconsin Green Bay

Green Bay is home to several universities and a technical college. We only include three in our discussion below because they have the greatest impact on Green Bay's housing market, particularly when students live off-campus. There are both positive and negative impacts on the housing market when college students live off-campus within a community. Firstly, they increase demand for homes within walking distance of the campus, which can be positive. On the other hand, they also place additional pressure on a tight affordable housing market. Student housing can also aid in driving rent up as landlords can charge more, especially when homes are rented by the room, and most students sign a one-year lease so landlords can raise rents every year if the market will allow it.

University of Wisconsin - Green Bay

The University Wisconsin Green Bay has experienced enrollment growth in the past 10 years. Their most recent enrollment number for 2019 was 8,098. UW Green Bay has Resident Halls, Private Room Apartments and Shared Room Apartment options for its students on-campus. The residence halls house 794 students, the private room apartments house 716 and the shared room apartments house 567. Overall 64% of students at UW Green Bay live off campus and commute for classes (approximately 5,183). The University has no good way of knowing where these students live, because they often have on file only a "home" address which may be their parents' home. It is presumed a sizable majority of those living off-campus live in the City of Green Bay.

There were 11 UW-GB students who responded to the community survey, 73% said they live in Green Bay, the remainder live in Allouez, Bellevue and Howard. For those who do not live in Green Bay, the reason is because they couldn't find the housing they wanted, housing prices are too high or they were looking for a more desirable neighborhood character. These students live in a mix of detached single

family homes, duplexes and larger apartment complexes (5 or more units per building). Cost is by far the most important factor for these students when they chose where to live. Half of these students have had to forego other needs such as food, healthcare or childcare to continue to pay for housing. As is true in most places with a large off-campus student population, the high percentage of cost burdened renters (66% of renters) in the City is at least somewhat due to off-campus students.

St. Norbert

Saint Norbert's total enrollment has been trending downward, most recently at 2,081 students in 2019. The school provides different options for first year students which are more dorm style and upperclassmen can choose from apartments, single family detached homes and townhomes, all owned by the college. The school expects students to live on campus all four years and so there are very few commuter students.

Figure 72. St. Norbert University Enrollment

Source: St. Norbert University

Northeast Wisconsin Technical College

Northeast Wisconsin Technical College's (NWTC's) enrollment increased between 2013 and 2016 and then experienced a large decrease in 2017 by 12% (1,193 students). The Green Bay Campus has very limited student housing options and the majority of students are commuters. In 2018 a private developer built a new 100-student resident hall that is now open for NWTC students. This is the only option for students to live on campus. Students living off campus live in other housing within the City or in other communities.

Figure 73. Northeast Wisconsin Technical College Enrollment

Source: Northeast Wisconsin Technical College

There were 20 full-time NWTC students who took the survey. 75% said they live in Green Bay while the others live in De Pere, Ashwaubenon, Howard and Suamico. The top reasons people chose to live outside of Green Bay were the housing cost, school district and to live closer to family. These students live primarily in detached single-family homes and duplexes, several live in larger apartment complexes (5 or more units). Cost was the most important factor for nearly all students in deciding where they live. Half of NWTC students have had to forego other needs such as food, healthcare or childcare to continue to pay for housing.

OTHER HOUSING MARKET FORCES

The housing market is impacted by a variety of local and national forces, including trends and public policy and regulation. This section describes some of those forces.

TAXES

A common theme that came up in the community survey and focus groups is the impact taxes have on a household's decision to live in Green Bay or in another community with lower tax rates.

Based on 2019 data from the Wisconsin Department of Revenue, Green Bay's mill rate is higher than neighboring communities. It's generally expected that cities will have higher tax rates than towns and villages because they maintain more infrastructure and offer more services per capita. The City's infrastructure is also generally older and has more repair costs than in most of the secondary market. Green Bay is between four and eight times larger than all of the communities in Figure 74. The Village of Howard has the lowest mill rate at .016462. Green Bay's mill rate is 32% higher than Howard's. Twelve percent of community survey respondents noted that taxes were an important factor in deciding to live at their current residence.

Figure 74. 2019 Mill Rate Comparison

Source: Wisconsin Department of Revenue

*The median home value in Green Bay is based on 2018 5-Year ACS estimates

Municipality	2019 Mill Rate	Taxes on \$132,500 home	Difference vs. Green Bay	2018 Population
Green Bay	0.024073	\$ 3,190	\$ -	105,477
Allouez	0.022521	\$ 2,984	\$ (206)	13,757
Suamico	0.019974	\$ 2,647	\$ (543)	12,676
De Pere	0.019269	\$ 2,553	\$ (637)	24,699
Ashwaubenon	0.017837	\$ 2,363	\$ (826)	16,795
Bellevue	0.01762	\$ 2,335	\$ (855)	15,423
Howard	0.016462	\$ 2,181	\$ (1,008)	19,508

ASSESSED PROPERTY VALUE

Another method of evaluating housing conditions is to consider the value per square foot of homes. In the maps on the following 4 pages, value per square foot is made up of land and improvement values. While both land and improvements (buildings) generally appreciate over time, development and use trends can drastically shift associated land values over the course of decades. In practice, this means that very desirable areas can have a larger increase in land value, while other areas grow at rates more consistent with overall inflation. This will be something to stay aware of especially as Green Bay's downtown is redeveloped and becomes an increasingly desirable place for businesses to locate and people to live.

In general, single-family home values near the edges of the City are higher (\$100/SF or greater), while homes near the center of the City are lower in value (\$75/SF or less) (see map on the following page). Value per square foot often correlates to housing age, which appears to be the case here.

A map of value per square foot for multi-family structures follows the single-family map. In general, value per square foot of multi-family dwellings is lower than that of single family homes, but the geographic trend is consistent, with lower-value, older units near the City center.

INFILL REDEVELOPMENT HOUSING OPPORTUNITIES

The City's priority focus for infill redevelopment is parking lots downtown. The City has added structured ramp parking downtown which addresses the need for parking downtown and is an acknowledgment that space is limited, and the trade-off for parking is not constructing another commercial or residential building that could stimulate economic growth and add to the vibrancy downtown. The only issue is that many of these parking lots shown below are privately owned.

The City recently purchased Associated Bank's parking lot, and put out a request for proposals for what they would like to see a developer propose on the site. This approach was successful for Green Bay because it was able to identify specifically what type of development was desired in that location (mixed use with affordable and market rate housing). The developer also saw this approach as

favorable because it told them exactly what the City wants and where they want it.

The City maintains a website of for-sale City-owned properties with details and any eligible funding programs. RFPs are included for some of the large development sites: <https://greenbaywi.gov/332/Available-Properties>. This information is something the City should continue to focus on to communicate to developers what they want and where they want it.

Redevelopment of commercial areas was also discussed in focus groups. These sites are typically near amenities and have good access to transit making them ideal locations for workforce housing. Military Avenue was one specific location that was suggested.

- Parking Garage

SUPPLY OF AVAILABLE LOTS

In addition to redevelopment opportunities, there are parcels in the City that are zoned for residential use, but remain vacant. Figure 76 shows where these parcels are located.

Currently, there are around 100 parcels considered vacant residential properties. Of these, 57% are under development. The remaining 45 lots are owned by the City. These City lots range in size from 0.03 to 0.96 acres. Of these properties, 31% are zoned D2 (Downtown 2), 27% are zoned R1 (low density residential), 20% are zoned OR (office residential), 11% are zoned C1 (Commercial 1), 9% are zoned R3 (Varied Density Residential) and 2% are zoned R2 (Medium Density Residential).

Development in the City is limited by the location of wetland, floodplain and steep slopes as shown on the following page. All of these development limitations are found adjacent to Lake Michigan, the Fox River, East River and Baird Creek. While these water features add to the vibrancy of the community they also prevent or increase the cost of development in certain areas within Green Bay.

REGULATIONS

Zoning

Green Bay's Zoning Ordinance has four traditional residential zoning districts:

- "RR" Rural Residential
- "R-1" Low Density Residential - New Lots
- "R-2" Medium Density Residential
- "R-3" Varied Density Residential

Of these four residential zoning districts, the R-3 district is the only one that allows multi-family housing (3 or more units) by right. Townhome style homes (single-family attached) are permitted by right only in the R-3 district. Single-family is allowed by right in all residential districts, with the exception of the R-3 district. There are also mixed-use and commercial districts that allow residences either by right or as conditional uses (see table on the prior page).

Currently the mixed use districts in the City (OR, NC and D) allowed attached single-family and multi-family by right, which promotes the development of housing types that are generally more affordable. Residential development by right within the zoning code reduces unpredictability and helps to ease the procedural costs of housing development. Carriage houses (accessory dwelling units) are permitted by right only in the OR and NC districts. These are a conditional use in the R-1 and RR districts. Accessory dwelling units (ADUs) offer another opportunity to create affordable housing. When renters in the community survey were asked if they would consider living in an ADU, 66% said they would consider it. When homeowners were asked if they would be willing to add an ADU to their property, 20% said yes.

One part of Green Bay's ordinance that offers increased flexibility to accommodate a variety of needs and uses is the planned unit development (PUD). This type of zoning allows for a mixture of residential, commercial and public facilities along corridors. The purpose of the PUD is to encourage alternative designs that allow a mix of uses in one area and better use and integrate the site's natural characteristics as well as the existing built environment's characteristics. Approval of a PUD results in the creation of an overlay to the base zoning district. Many of the City's new multi-family and transitional/shelter developments go through the PUD process (though they do not readily show up on the zoning map).

Minimum lot sizes vary from 10,000 square feet in the RR (Residential District) to 5,000 square feet in the R-2 (Medium Density) and R-3 (Varied Density) districts. The RR district comprises 35% of all residentially-zoned parcels within the City. The intent of this district is to provide for

limited large-lot development in areas of the City not yet served by public utilities. For areas served by public utilities this district allows for the option of conservation subdivision design. The use of this district is intended to be limited, while it currently makes up a sizeable portion of the residential acreage in the City (see map on the following page). Anecdotal information from one focus group suggests new lots in the community tend to be large and it is often expensive to get infrastructure to these places, which can drive up cost for developers which then is passed on to homebuyers.

Development Fees & Process

Some of the costs directly passed on to consumers from developers in both ownership and rental markets are fees associated with development. Development review fees are assessed by the City in order to ensure the quality of development. Impact fees are assessed to cover the incremental cost of City facilities needed to accommodate new housing.

The development example on page 70 shows total development fees for a hypothetical subdivision of 30 (2,500 sq. ft.) single-family homes, eight (1,500 sq. ft.) duplexes and one apartment complex with 60 units. Fees for this 106-unit development would add a total of \$264,585 to the project (an average of \$2,496 per unit). These fees are typically passed on to buyers and renters through purchase price/rents. It is important that fees be reassessed periodically to ensure they are appropriately reflecting the City's costs and not dramatically out of step with fees charged by other communities in the region.

Focus group participants included several developers who stated that generally development fees in Green Bay are reasonable. The only concern about high fees was in relation to the stormwater management; some developers believe that stormwater requirements are too onerous, though they understand this is something that is passed down from the Wisconsin Department of Natural Resources. The other concern developers had was in regards to the length of time it takes for applications and approvals in the City. They felt it takes too long to get approvals in the City which costs them more money as they wait to start development.

SINGLE-FAMILY CONVERSION

As with many college towns in Wisconsin, Green Bay has many owner-occupied homes that were converted to renter-occupied homes. Property owners either rent out the entire home, or create multiple rental units within the home. Green Bay's zoning ordinance allowed people to convert single-family units into multi-family units until the 1990s. This is not an entirely undesirable occurrence except these units can create concern about noise and parking among nearby owner-occupants when the home is divided up into multiple rental units. A positive aspect of single-family conversion is that it does provide affordable rental housing stock. The map below shows the likely location of

single-family homes that were converted to rentals. Note, this data is not able to differentiate between entire single family homes that are rented out and single family homes that include multiple rental units. These parcels were identified because they are single family homes and the property address does not match the owner address in the City Assessor's data. There are approximately 3,410 single family rental conversions in Green Bay.

Figure 79. Single-Family Renter Occupied Properties

LIVABILITY

Green Bay attracts residents for numerous reasons. When survey respondents were asked which factors had the most positive impact on their decision to move to Green Bay, the factors that were considered to have the most positive impact were access to amenities and neighborhood character.

Amenities

Green Bay offers unique amenities that attract visitors, businesses and residents:

- Lake Michigan
- College/Universities/Technical College (UW - Green Bay, St. Norbert, Northeast Wisconsin Technical College)
- Entertainment (Resch Center, Meyer Theatre, etc.)
- Wineries & Vineyards (Capitain's Walk, Duck Creek Vineyard, LedgeStone Vineyards, etc.)
- Breweries (Badger State Brewing, Copper State Brewing, etc.)
- Museums/Historical Sites (Astor Historic District, Green Bay Packers Hall of Fame, etc.)
- Farmers Markets
- Recreation (Trails, Parks)
- Home of the Green Bay Packers

Green Bay's downtown is changing as the City seeks to attract people to downtown living and events. One critical project in this transformation is the Shipyard Redevelopment located along the Fox River, which will turn a brownfield into a destination for recreation, tourism and living. This will serve as a catalyst for other projects downtown and has the potential to increase demand for housing in and near downtown.

Neighborhood Associations

Neighborhood associations were a positive aspect of Green Bay that was brought up in focus groups. Green Bay has 43 neighborhood associations which engage in a variety of activities from organizing block parties/picnics, to conducting traffic studies or educating residents about zoning issues and new developments that might impact the area. Neighborhood associations in Green Bay receive City funding and the presidents of all of Green Bay's Neighborhood Associations meet at a monthly meeting of the Green Bay Neighborhood Leadership Council. These meetings provide a formal link between the neighborhoods and City government.

According to focus group participants, neighborhood associations in Green Bay do a good job of building cohesiveness between renters and homebuyers. One wish that came up in focus groups was for more neighborhood associations to get involved in advocating for low-

income residents and directing people to help when they need it—whether this be treatment, tenant resources, or programming for children. It is also important that as new neighborhoods are developed, new neighborhood associations continue to be developed as well.

Transportation

The City is well-served by public transit. The primary issue that came up in regards to transportation during focus groups was the lack of bus connections to surrounding communities. Currently the Green Bay Metro provides bus service to Green Bay, De Pere and the Villages of Allouez, Ashwaubenon and Bellevue. Service includes 17 buses on a fixed route schedule that operate Monday through Friday, 5:15 AM to 9:45 PM, Saturday from 7:15 AM to 6:45 PM, and Sunday service when the Green Bay Packers have home games. Bus service is strongest in areas with public housing and jobs that pay the lowest wages, indicating an active effort to match transit supply and demand. Based on hours of operation, public transit is hard to use for 2nd and 3rd shift workers.

Trails were brought up in one focus group as something that makes Green Bay a desirable place to live. Walking/hiking is the most popular recreation activity for Wisconsin residents, according to the WDNR's Wisconsin Statewide Comprehensive Outdoor Recreation Plan. As such, it will be important for the City to continue to plan for hiking/walking/running trails within the City. The City currently has approximately 22 miles of shared-use/informal trails within the City.

School District

The Green Bay Area Public School District had a total enrollment of 20,248 for the 2019/2020 school year. This is a decrease of 4.2% from the 2016-2017 school year. When looking at rankings by US News, the Green Bay Area Public School District ranked 14th in the Green Bay Area. US News ranks high schools on six factors based on their performance on state assessments and how well they prepare students for college. The graduation rate for the school district is 86%, lower than in the surrounding districts of: Ashwaubenon, (91%), De Pere (96-97%), Howard-Suamico (91%) and Pulaski (98%).

Stakeholder engagement during this study revealed mixed reactions regarding the school district. Some focus group participants felt that Green Bay schools are a draw, while some felt it pushed people to look for housing in surrounding communities. Of survey respondents, 32% said the school district positively impacted people's decisions to live in Green Bay and 20% felt the school district had a negative impact on people's decisions to live

HISTORIC HOUSING

Green Bay has six historic districts: Astor, Broadway-Dousman, Broadway-Walnut, Downtown, Oakland-Dousman and Whitney School. These districts exist to ensure new construction and remodeling projects are consistent with the historic character of the existing buildings (Chapter 13 of the City's Ordinances). Those requirements are a long-term benefit to the character

and quality of the community but they can also become a short-term impediment to investment. In Green Bay, historic districts are overlay districts. Specific guidelines for design exist in each district's historic preservation plan. All applications for new construction or remodeling are reviewed by the Landmarks Commission.

NATIONWIDE TRENDS

Green Bay is connected to and affected by trends affecting housing across the country, including changes in financial regulation, demographics, development practices and cultural norms. These are some of the most relevant changes affecting housing demand in the Green Bay area:

1. Household size and house size

Household size – the number of people living together – has been in decline for more than 50 years due to multiple related trends, though this has not been the case recently in Green Bay. In 1960 the average U.S. household size was 3.35 people, and by 2010 it was 2.59. Causes include declining birthrates, declining marriage rates and increasing age of first marriage, and increased longevity. In other words, people are spending more of their lives single, and those that choose to be parents are having fewer kids.

The effects of these changes on housing are varied, and not always predictable. The size of new houses has increased more or less steadily over the past 40 years, from an average of 1,400 SF in 1970 to an average of 2,600 SF in 2013. While households have been shrinking, families have been giving children their own rooms and designating separate spaces for things like home offices. There has been a modest trend back toward smaller units, even “tiny house” living, but these are not visible in the continuing overall growth of the average home size. A more predictable trend is the growth of retirement housing to accommodate the needs and interests of older people, many of whom live for years as one-person households. National data on apartment size suggest they too have grown, though not as dramatically, to an average of about 1,000 SF.

2. Aging Population

Trends in US Census data show that the segment of the population age 65 or older is increasing across the nation. The Population Reference Bureau (PRB) estimates that the number of Americans age 65 and older is projected to more than double between 2014 and 2060. As Baby Boomers age, we expect the number of seniors in Green Bay to continue to rise.

PRB notes that, especially in the Midwest, those age 65 and older are choosing to age in place, or stay in their homes as long as possible. The community survey also found that most older residents prefer to stay in their current housing as long as possible. The second most common type of unit for this age cohort is within apartment complexes containing 20 or more units (19%). Due to the high number of seniors aging in place, accessibility improvements are critical as is offering senior apartments.

Housing Affordability

Large-scale economic trends are bringing housing affordability into focus as a prominent issue across the country. While the household income of the top 5% of US households has more than doubled in the past 50 years, middle income households have seen only about a 10% increase in that period. Meanwhile, inflation-adjusted housing costs have risen roughly 50% for rental housing and 70% for home ownership in that period. The result of these trends is that housing is requiring a bigger portion of household incomes. Thirty percent of income has long been viewed as the standard threshold for “affordable”, as defined by the federal government. Twenty percent of owners and 43% of renters in the City currently pay more than 30% of their income for housing.

Local governments are now stepping in to address the challenges around affordability. Spurred by businesses concerned about hiring needs, complaints from residents who can’t find desirable housing within their budgets, and community concerns about declining conditions due to lack of reinvestment in housing, communities are coming forward with policies and initiatives to address this challenge.

3. Stricter Lending Regulation, More Student Loan Debt, and Delayed Home Ownership

Lender underwriting requirements have stiffened considerably in the wake of the housing crisis that caused the Great Recession. In January 2014, provisions of the Dodd-Frank Act kicked in that establish standards for a “qualified mortgage” that can be purchased by Fannie Mae or Freddie Mac. The standards compel banks to verify that borrowers’ debt-to-income ratio doesn’t exceed 43 percent of their gross income, part of an effort to prevent people from overexposing themselves to the risk of foreclosure. Banks that fail to verify this debt ratio can be sued by the borrower if he or she later defaults on the loan. The long-term effects of this regulation are uncertain, but it is fair to assume that some aspiring homeowners will be protected from foreclosure by being denied a mortgage in the first place.

With the rise in housing costs and stricter borrower protections, this also means that first-time homeownership is more difficult to accomplish due to rising down payment and closing costs. According to the State of the Nation’s Housing Report 2019 (Joint center for Housing Studies of Harvard University), as the large millennial generation ages into their 30’s, when homebuying peaks, there should be a growing demand for homeownership. If age-specific

NATIONAL IMPACTS

homeownership rates remained at the same level in 2018, household growth alone would add roughly 8.0 million homeowners between 2018 and 2028.

The combined effect of increased student loan debt, increased ownership costs, and stricter borrowing rules is a delay in the average age of first-time home ownership. The National Association of Real Estate found that between 1993 and 2018 the average age of first-time home buyers rose from 26 to nearly 34.

4. Planning and Development Practices

The dominant trend in community planning and development after World War II was the segregation and concentration of uses and housing types – stores here, single family homes there, apartments somewhere else. This pattern has been shown to weaken neighborhoods and communities by isolating people and building in a dependence on car use. It is now generally recognized that healthy neighborhoods are those that people can stay in over time as their needs and interests change. Healthy neighborhoods include a mix of housing types, sizes, and price points, and they often include or are near to stores and restaurants. Healthy neighborhoods are also walkable, enabling anyone unable to drive—kids, seniors—the ability to get around safely.

5. COVID-19

The full health and economic impacts of COVID-19 are still to be determined as new cases occur and programs and

policies are put in place at the national and local levels to try and keep businesses afloat and people employed. While people spend more time in their homes, there is some speculation that this may lead them to look for larger homes. On the other hand, economic recession with workers out of jobs or in fear of losing their jobs is likely to reduce demand for big ticket items like new cars and homes. Anecdotal evidence from realtors suggests that there was a slowdown for people looking for homes in Spring of 2020, however it seems that as we get further into the summer, things are beginning to pick up.

Preliminary real estate data shows that home sales did fall off what they have normally been over the last few years, see Figure 83.

In May 2020 Governor Evers announced a \$25 million program to help Wisconsinites pay rent during COVID-19. Eligible households must have income at or below 80% of the County Median Income and can receive up to \$3,000 in rental payments and/or security deposits. This program should serve to alleviate financial stress for many renters who may be out of a job or laid off and prevent eviction. If the recession does deepen and more jobs are lost, this could create a very real crisis among low-income renters who face the possibility of being evicted if they can't pay rent.

HOUSING GAPS AND OPPORTUNITIES

UNITS NEEDED

Overall

This chapter includes unit recommendation under two projection methods. The first method uses the Wisconsin Department of Administration (DOA) projections for the City. These estimates are considered conservative as they rely on a continuation of past growth trends in the City. The second projection method, the high growth scenario, uses DOA growth projections from the secondary market surrounding Green Bay, which has been projected to grow at a faster pace than the City. It is useful to have multiple growth scenarios to allow for some flexibility as to what the future might hold for Green Bay. The City is not limited to a continuation of what past growth has been - and has an opportunity to pull in new residents who are coming to live in the region.

The Wisconsin Department of Administration estimates that the total number of households will increase in Green Bay to 48,869 in 2030 and 49,683 in 2040. Overall, this is a 17% increase from today. The growth in housing units should exceed the growth in households, to accommodate 1% vacancy of owner-occupied units and 5% vacancy of renter-occupied units.

Market conditions support the continued growth of all types of housing, including both renter- and owner-occupied units. Under the DOA projection of accommodating 7,168 households over the next 20 years, and continuing to

support a healthy balance owner- and renter- units, the City will require a net addition (accounting for the loss of units in redevelopment) of about **3,314 rental units (140/year) and 4,052 owner-occupied units (170/year)**. These projected needs are based on the assumption that the current balance of 44% rental units and 56% ownership units is maintained.

Under the high growth scenario assuming there will be 16,095 new households by the year 2040, the City will require a net addition of about **7,441 rental units (310/year) and 9,098 owner-occupied units (375/year)**.

This equates to approximately the following per year, based on current **rental** pricepoints and HUD FY2020 income categories:

- 75-170 units with monthly rent up to \$1,030
- 50-110 units with monthly rent between \$1,150-\$1,650
- 15-30 units with monthly rent greater than \$1,440

This includes attached and detached units and equates to approximately the following per year, based on current **ownership** price points and HUD FY2020 income categories:

- 35-75 units priced up to \$158,000
- 35-75 units priced between \$178,000-\$248,000
- 100-225 units priced greater than \$217,000

Figure 84. Rental Unit Need Projection for Green Bay (High Growth Scenario)

Source: HUD CHAS, MSA Professional Services

Income Thresholds	Current Unit Oversupply (Undersupply)	2030 Total Renter Households	2030 Oversupply (Undersupply)	2040 Total Renter Households	2040 Oversupply (Undersupply)
0-30% AMI	(3,715)	7,748	(5,028)	8,871	(6,151)
31-50% AMI	8,870	4,666	8,079	5,342	7,403
51-80% AMI	(1,285)	5,701	(2,251)	6,528	(3,078)
>80% AMI	(3,385)	4,425	(4,135)	5,066	(4,776)

Figure 85. Rental Unit Need Projection for Green Bay (Conservative Growth Scenario)

Source: HUD CHAS, MSA Professional Services

Income Thresholds	Current Unit Oversupply (Undersupply)	2030 Total Renter Households	2030 Oversupply (Undersupply)	2040 Total Renter Households	2040 Oversupply (Undersupply)
0-30% AMI	(3,715)	7,397	(4,677)	7,520	(4,800)
31-50% AMI	8,870	4,454	8,291	4,528	8,217
51-80% AMI	(1,285)	5,443	(1,993)	5,533	(2,083)
>80% AMI	(3,385)	4,224	(3,934)	4,295	(4,005)

These calculations are based on the assumption that the percentage of renters vs. owners in the City, and the percentage of households that fall into each income bracket, remain constant.

Rental Units

When looking at specific price/affordability tiers within the rental market, the largest gaps exist at the highest and lowest levels of rent. Green Bay's existing rental stock is relatively old, making it more affordable as compared to surrounding communities. However, there is still an undersupply of 3,715 units affordable to households earning 30% median income or less. Under the conservative growth scenario, if no new units are added, by 2030 there will be an undersupply of 4,677 rental units affordable at 0-30% median income. By 2040 there will be an undersupply of 4,800 of these units. These units currently fall within the \$430-\$650 rent category (note: this includes utilities). There is also a current undersupply of 1,285 of units affordable to households earning 51-80% median income. If no new units are added, by 2030 this will be an undersupply of 1,993 units and 2,083 units by 2040. These units currently fall within the \$1,150-\$1,650 price range. There is also a shortage of 3,385 rental units for those households earning greater than 80% AMI. If no new units are added, by 2030 this will be a shortage of

3,934 and by 2040 a shortage of 4,005 units. These units are priced between \$1,440-\$2,470.

The only oversupply of housing is currently for households earning 31-50% median income. There is a current oversupply of 8,870 units. These units currently fall into the \$720-\$1,030 price range. If no new units are added, by 2030 this will be a 8,291 unit oversupply, and by 2040 a 8,217 unit oversupply.

When looking at the high growth scenario, these numbers change to even greater under supplies in most categories and a smaller oversupply of units affordable at 31-50% median income (see Figure 84).

It is important to note that some of the shortages at specific price points can be filled by means other than construction of new units. Some of those units abundant at the 31-50% median income affordability tier can be made affordable to households earning below 30% median income, and others can be renovated and upgraded to respond to the gaps at higher price points.

Ownership Units

A similar breakdown of the ownership housing stock by affordability tiers shows an oversupply of units available at the lowest price points and an undersupply of units available at higher price points. Specifically, under the conservative growth scenario there is an oversupply of 9,515 units available to households earning up to 50% median income. These homes are currently priced \$110,000-\$158,000. If no new homes are added, that surplus will drop to 8,857 homes by 2030 and 8,772 by 2040. There is also an oversupply of 2,575 units that are affordable to households earning 51-80% median income. If no new units are added, the oversupply will drop to a surplus of 1,843 units by 2030 and 1,750 units by 2040. These homes are currently priced \$178,000- \$248,000.

At 81-100% median income there is an undersupply of 1,960 homes currently available. If no new homes are added, by 2030 this becomes an undersupply of 2,455 units and by 2040 an undersupply of 2,518 units. These homes are priced \$217,000-\$311,000. There is also currently an undersupply of 9,725 homes that are affordable to households earning

greater than 100% median income. If no new homes are added, by 2030 there will be an undersupply of 11,397 units and by 2040 an undersupply of 11,611 units. These homes are currently priced \$260,000- \$373,100.

Under the high growth scenario there is still an oversupply of units affordable to those earning 80% median income or less and an undersupply of units affordable to those earning greater than 80% median income.

The oversupply of units at lower price-points is not surprising as a majority of the City's housing stock is older—64% was built before 1980 and 17% was built 1939 or earlier. Due to the age and condition of the older housing stock, the City has an opportunity to invest in current ownership housing units.

The undersupply of higher-priced homes is also not surprising as only 2% of the City's single-family housing stock has been built since 2010. Focus groups also confirmed there is a need for moderately priced housing, up to \$250,000.

Figure 86. Ownership Unit Need Projection for Green Bay (High Growth Scenario)

Source: HUD CHAS, MSA Professional Services

Income Thresholds	Current Unit Oversupply (Undersupply)	2030 Total Owner Households	2030 Oversupply (Undersupply)	2040 Total Owner Households	2040 Oversupply (Undersupply)
0-50% AMI	9,515	5,340	8,616	6,073	7,847
51-80% AMI	2,575	5,894	1,576	6,748	722
81-100% AMI	(1,960)	3,986	(2,636)	4,563	(3,213)
>100% AMI	(9,725)	13,468	(12,008)	12,419	(13,959)

Figure 87. Ownership Unit Need Projection for Green Bay (Conservative Growth Scenario)

Source: HUD CHAS, MSA Professional Services

Income Thresholds	Current Unit Oversupply (Undersupply)	2030 Total Owner Households	2030 Oversupply (Undersupply)	2040 Total Owner Households	2040 Oversupply (Undersupply)
0-50% AMI	9,515	5,063	8,857	5,148	8,772
51-80% AMI	2,575	5,627	1,843	5,720	1,750
81-100% AMI	(1,960)	3,805	(2,455)	3,868	(2,518)
>100% AMI	(9,725)	12,857	(11,397)	13,071	(11,611)

These calculations are based on the assumption that the percentage of renters vs. owners in the City, and the percentage of households that fall into each income bracket, remain constant.

Senior Units

Green Bay currently has about 19,500 households age 55 and older. By 2030 this is projected to be 24,500, and by 2040 27,300 households. Some in this age cohort will continue to live in their current homes, but others will look for dedicated housing for seniors. The projections for senior units needed in Green Bay are into two categories: those requiring Assistance with Daily Living (ADL), and those not requiring ADL. Examples of ADL include meal preparation, assistance with taking medication or bathing, which are part of assisted living and nursing home facilities.

For Independent living facilities (ADL not required), there is a current estimated demand for 2,530 subsidized units and 1,362 market rate units. This need increases to 2,948

subsidized and 1,587 market rate units in 2030 and 3,130 subsidized and 1,685 market rate units in 2040.

These numbers do not include the number of units that currently exist in the City, and do not include need from communities outside the City.

For assisted living facilities/nursing homes/memory care units, there is a current estimated need for 16 beds in Green Bay. By 2030 this increases to a need for 800 additional beds and 1,337 additional beds in 2040. This does include the existing supply of assisted living/CBRF/nursing home facilities currently found in Green Bay. This does not include need from communities outside the City.

WHERE UNITS ARE NEEDED

Affordable Housing

Affordable rental housing often faces two challenges: local opposition (“Not in my Backyard”) and financial feasibility. Affordable housing is almost always subsidized in some way. Common methods for subsidizing affordable housing include Low Income Housing Tax Credits (LIHTC) and local funding through active Tax Incremental Finance District or an affordable housing fund. Applications for 9% LIHTC are competitive and applications receive points based on a number of criteria they can meet in the following areas: higher incomes and lower unemployment (by census tract); being in a high-performing school district; and being near amenities such as schools, parks, grocery stores, libraries, etc.

The map on pages 78-79 show priority areas for affordable housing based on funding criteria for LIHTC. Lighter areas are the highest priority areas for housing. The map also shows a quarter-mile buffer around current bus lines, to aid local discussions in prioritizing assistance in areas served by transit. In addition to the benefits of increasing a potential housing project’s LIHTC application scoring, building housing near parks, schools, transportation and other amenities is good planning practice. In the community survey, over 50% of respondents said access to amenities positively influenced their decisions to live in the community, more than any other factor.

A benefit to Green Bay’s older housing stock is that it provides naturally occurring affordable housing. For this reason, ownership affordability is considered a low priority. Of greater issue is the quality/desirability of homes and barriers to homeownership such as lack of downpayment, credit history, and low income levels.

Target Redevelopment Area

The City has a number of catalytic development projects occurring downtown:

- **The Shipyard Project**—renovating brownfields and constructing a signature outdoor public recreation and entertainment facility and multi-family housing.
- **Rail Yard Innovation District**—22-acre historic redevelopment/development, including condominiums, located between Broadway, Bond St., Donald Driver Way and Dousman St.
- **901 Main**—three-story, mixed-use urban development with multi-family units.
- **Whitney Park Townhomes**—located in the 200 block of N. Van Buren Street, adjacent to the future Whitney School redevelopment.

These projects will make the downtown a more vibrant and attractive place to live. The downtown has a significant amount of surface parking which could be converted into housing, commercial or something else that would increase the taxable value of the property and the vitality of the area. The City has consolidated some of its parking into ramps downtown, but could continue to do so. New and existing ramps could serve the parking needs of new housing and other businesses downtown.

Any housing that is added downtown should be in some multi-family or townhome format, though the specific design and density could vary depending on the site. There is no building height restriction in the D2 zoning district; height is restricted to approximately 3 stories within the D1 district. Building heights may, and should, be increased with a conditional use permit, especially when a taller building is proposed near buildings of similar size.

Senior Housing

Downtown is also an ideal location for active living senior housing. Although many seniors prefer to age in place in their existing homes, there is a movement of retirees and empty nesters moving downtown. The appeal of downtown is being closer to services and amenities - public transit, health care, pedestrian-friendly streets, arts culture, libraries, stores and human interaction - all things that are also attracting younger residents to live downtown. The preferred location for assisted living facilities and nursing homes is more flexible, though proximity to a health care facility can be advantageous.

New Owner-Occupied Housing

New owner-occupied housing should be part of balanced neighborhoods—neighborhoods that include a mix of housing types and price points with convenient access to daily needs, goods and services. Balanced neighborhoods have a mix of attached and detached housing formats and a range of sizes and price points. Balanced neighborhoods with good urban design can not only lead to long term quality and comfort in neighborhoods, but can also serve to improve equity in education environments.

Federal Low Income Affordable Housing Tax Credits (LIHTC) - Section 42 Housing

LIHTC (or Section 42) is a federal program which gives the Wisconsin Housing and Economic Development Authority (WHEDA) the authority to issue tax credits for acquisition, rehabilitation, or new construction of rental housing for low-income households. When a project is completed, investors can deduct from their taxes about 4% or 9% of their investment in the project each year for ten years. LIHTC developments must continue to meet the established affordability requirements for 30 years, with either 20% of units affordable at 50% of the Area Median Income or 40% of the units at 60% of median income. WHEDA monitors the condition of each project awarded with credits to ensure they stay in good repair, have acceptable management practices and maintain affordability. There are two types of tax credits available within the LIHTC program:

Federal 9% Tax Credit - Competitive

The 9% tax credit is available for new construction and rehabilitation projects that do not have other federal funds. Nine percent (9%) tax credits are received through a competitive application process with WHEDA. Per WHEDA guidelines, Projects require a local funding match in order to score well.

Federal 4% Tax Credit - Non-competitive

The federal 4% tax credit is available for acquisition, new construction and rehabilitation projects, and is often used for rehabilitation. These funds can be used with other federal funds. Four percent (4%) tax credits are received through a non-competitive application process with WHEDA. Four percent (4%) tax credit projects are often more difficult to use because they require a mixture of funding sources, of which local funding is important.

Wisconsin Low Income Housing Tax Credit (LIHTC)

State of Wisconsin 4% Tax Credit - Non-competitive

The state 4% tax credit is available for acquisition, new construction and rehabilitation projects. These state credits can be used to match the 4% federal funds. The state 4% tax credits are received through a non-competitive application process with WHEDA. The credits are awarded only if they are necessary for the financial feasibility of the property. A preference is given to developments located in municipalities with fewer than 150,000 people.

Highest Priority A

Affordable Housing Target Growth Areas

Green Bay Housing Study

**City of Green Bay
Brown County, WI**

IMPLEMENTATION

GOAL

Build Healthy Neighborhoods

The one fundamental goal that every strategy within this plan supports is healthy neighborhoods. Policies and investment in housing should not only diversify housing stock within the community, but should lead to healthy neighborhoods that are more likely to attract residents and reinvestment in the future. Healthy neighborhoods have:

1. Varied housing types, size and price points, including both owner- and renter-occupied units. This enables more people to stay in the neighborhood through shifting housing needs, and it limits future instability due to changes in the housing market.
2. Sidewalks and urban design features that make walking pleasant and safe (whether for transportation or for pleasure).
3. Convenient access to public transit and daily needs retail and services.
4. Quality parks and open space.
5. Community gathering places, including both public venues (e.g. community center) and private venues (e.g. coffee shops).
6. Active neighborhood associations and public or quasi-public places to meet within or near the neighborhood.

The City should prioritize projects that address both a market gap and criteria for healthy neighborhoods.

STRATEGIES FOR IMPLEMENTATION

Communication

Housing Committee

A Housing Committee or Subcommittee can be the driving force to implement this plan, including providing oversight on the development and administration of funding programs, supporting public outreach about the City's housing needs and programs, and supporting updates to this Plan as the market shifts and outside funding programs change year by year.

There is a wealth of housing experts within the community who have a good pulse on the type of housing needed in the City, barriers to development, incentives developers need for affordable housing, and other issues related to housing development, renting and owning. The Housing Committee should at least annually convene a meeting with these housing experts to discuss what is going on the market and any new issues that may be facing the community. One option would be to create a sub-committee under the Redevelopment Authority.

Staff & Developer Communications & Processes

Development projects require collaboration with multiple City departments. Getting feedback and sign-off from each department in an efficient manner is a challenge in many

communities, including Green Bay. It will improve the experience for developers and outcomes for all if the City is able to improve the process in the following ways:

1. Assign a City staff person as a single point of contact for each project who will help the applicant navigate the process. This person should be a part of all project communications and willing to resolve problems that may arise in the review and approval process.
2. Ensure reviews and inspections are completed fully and in a timely manner, and include all pertinent feedback during the first review.

Initiatives

Neighborhood Associations

Continue promoting neighborhood identity and social cohesion through neighborhood associations. Active Neighborhood Associations within Green Bay are one positive element that is contributing to neighborhood satisfaction already, according to focus group participants. The City could also use Neighborhood Associations as a way to engage residents in neighborhood planning efforts and developments that might impact a particular area. For major developments in/near a neighborhood that may provoke some controversy, the City Council/local alderperson should work with the appropriate neighborhood association(s) to host a neighborhood meeting where the developer can present to and seek feedback from the neighborhood.

City-Owned Properties

The City currently maintains a list of properties owned by the RDA for residential and other types of development. Incentives are offered for many of the lots and the City lists what type of development they would like to see. This

program should continued.

Regulation

Comprehensive Plan

The City is updating its Comprehensive Plan following the housing study which will serve to implement/reinforce the policies in this plan. The Comprehensive Plan's Housing Element text should focus on flexibility for diverse housing formats and price points. The Future Land Use Map should include flexibility in residential and mixed use areas. To this end, the City could create the following districts:

- Low Density Housing: These areas include single-family and two-family units (both rental and owner-occupied), for various income levels.
- Low and Medium Density Housing: These areas include single-family and two-family units, townhomes and small apartment complexes (up to eight units per building).
- Medium Density Housing: These areas include a variety of attached housing types (townhomes, small and large multi-family buildings). These areas are generally close to major streets, mixed-use areas, or commercial/complement areas to provide convenient, walkable access to transit, shopping, restaurants, and other amenities. Medium density housing should be used as a transition between high and lower density housing.
- High Density Housing: These areas include larger multi-family buildings. These areas are also close to major streets, mixed-use areas, or commercial/complement areas.
- Neighborhood Mixed Use: These areas should include relatively small existing and planned activity centers with retail, restaurant, service, institutional and civic

Figure 90. Online Matrix of Available City-Owned Properties

Source: www.greenbaywi.gov/332/Available-Properties

[Source: www.greenbay.wisgo.com/available-properties](#)

HOUSES	RESIDENTIAL LOTS	OTHER LOTS	LARGE DEVELOPMENT SITES
--------	------------------	------------	-------------------------

Address	Parcel ID	Lot Size / Square Feet	Plan	Asking Price
158 N. Maple Avenue	4-95	55' x 75' ~3,500 SF	UPDATE: The RDA has hired an architect to engineer plans for an attached garage to be placed within the footprint of the building. An architectural plan of the existing conditions will also be provided. This will be posted to the website as soon as they are completed with an anticipated release date of July 31st, 2020.	Negotiable
			Rehabilitate property by converting from multi-family to single-family for owner-occupancy.	

uses primarily serving nearby residents. Residential should be included in mixed-use buildings and as standalone multi-unit residential developments.

- **Community Mixed Use:** These areas should include existing and planned areas supporting an intensive mix of residential, commercial and civic uses serving residents and visitors from the surrounding area and the community as a whole. These areas are generally located at major intersections and along relatively high-capacity transit corridors, providing more residential units and commercial space compared to Neighborhood Mixed Use Areas.

Consider Waiving or Reducing Fees

Affordable housing is the most challenging type of housing to develop, in part because it's challenging to make it financially feasible. To help encourage affordable housing and reduce costs to developers, Common Council could consider waiving or reducing fees on a case-by-case basis. In some cases, this type of assistance can be used as local match for grant programs. The City could also consider covering the cost of the fees with TIF funds. Fee reductions should only be for projects with income-qualified affordable units that have some sort of requirement in place to be income-qualified for 15 years (the same as LIHTC).

Streamline Approval Process for Affordable Housing

Expedited approval processes save time and ultimately reduce costs to developers. A streamlined approval process for housing projects that include affordable units would offer an incentive to include these types of units in development. The City could consider committing to having determinations on developments with affordable housing made within 60 or 90 days.

To aid with communication and streamlining the process, the City could consider moving its permitting and planning review services online for the benefit of staff and applicants. This allows applicants to view the status of their project and comments from staff review. On the staff end, this pushes reminders to staff to get reviews done in a timely matter and facilitates communication between staff about projects. Evolve, Powered by Infovision Software is one example of such a service.

Code Enforcement for Student Housing

The City could create rental inspection programs in areas with a prevalence of single-family/two-family homes converted to rentals. As many of UW Green Bay's students live in off-campus housing, there is a direct connection between the University and the City. The City should work with the University on creating and funding an inspection program in which the cost of salaries for code enforcers could be shared. The goal of the program being to ensure

students are living in safe, healthy housing.

Reduce Parking Requirements for Affordable Housing

Parking is expensive, which adds to the cost of housing units. Lower-income households often have fewer vehicles and rely on public transit. Consider reducing parking requirements for all multi-family developments located within a certain distance (e.g. 1,000 to 1,500 feet) of a bus stop.

Review Requirements for Landscaping and Building Materials in Zoning Code

Design and landscaping requirements serve to preserve the quality and health of neighborhoods and communities, but they can also drive up developer costs, which is especially challenging for developers of affordable housing. The City should review its requirements for landscaping and hardscaping materials to see if any requirements can be softened or if there are materials that could be used to offer the same look at a lower price point. This issue was brought forward in focus groups as something that has deterred development of affordable housing in some areas of the city.

Zoning Code—Encourage Accessory Dwelling Units (ADUs)

An Accessory Dwelling Unit (ADU) is a housing unit located on the same lot as a single-family home, commonly over a garage, in a basement or in its own structure. Attached ADUs are the most common since they are the least costly option for an ADU. Financing can be difficult (the average cost to develop a stand-alone ADU is \$200,000), but these units allow homeowners to create an additional dwelling on their property for family members, caretakers, and friends in need of downsizing. Twenty percent (20%) of homeowners who took the Community Survey said they would be interested in developing an ADU on their property. Only two percent (2%) said they already have an ADU.

ADUs are currently permitted by right in the OR (Office Residential) and NC (Neighborhood Commercial Districts). ADUs are conditional uses within the R-1 (Low Density Residential-New Lots) and RR (Rural Residential) districts. Permitting ADUs by right in all residential areas would remove one hurdle for development. A requirement could be added that the property owner live on-site.

Enable Cottage Courts Through PUDs

The City's Planned Unit Development (PUD) zoning offers flexibility to accommodate a mixture of residential, commercial and public facilities along corridors. The PUD is meant to encourage alternative designs that allow a mix of uses in one area and better use and integrate the

site's natural characteristics as well as the existing built environment's characteristics. One alternative design the City could seek to promote is the "cottage court." Cottage courts are small groupings of housing around a shared public space. These can be for-sale or rental units. They offer a cost savings to developers/owners because they offer a small lot and a small home.

The City should explore areas where implementation could be possible and assemble and promote these areas to developers through the RDA.

Create a Rural Holding District

The City currently uses the RR (Rural Residential) district for land that is not yet served by utilities within the City. This is intended for limited use, however it makes up 35% of land that is zoned residential in the City. This make the default size for lots within this district to be 10,000 square feet, which facilitates the development of larger lot, single-family residential homes rather than a diverse spectrum of housing types and price points.

The City could create a Rural Holding District for undeveloped land. The purpose of this district is to hold lands as agricultural or open space until they are ready to transitional into urban districts. The only permitted use by right in these areas should be agriculture and open space. Once the City has development proposals for these areas, they should be rezoned appropriately, ideally integrating healthy neighborhood concepts. This will help ensure a mix of unit types and price points in the City.

Figure 91. Cottage Court in Overland Park, KS

Source: www.opkansas.org

Funding

Create an Affordable Housing Trust Fund

The City could create an affordable housing trust fund as a general purpose funding vehicle that can serve various affordability initiatives anywhere in the City. This can be used for matching funds, land purchase, new construction, renovation and downpayment assistance. Funds could come from the TIF Affordable Housing One-Year Extension, general obligation bonds, sale of surplus land, general fund budgeting and private contributions. This funding could be leveraged to make developers more competitive when applying for Low Income Housing Tax Credits (LIHTC).

Tax Increment Financing—Affordable Housing Incentives

The City should use TIF for the construction of infrastructure - water, roads, utilities, sewer - necessary to encourage the development of housing.

Tax Increment Financing - Affordable Housing One-Year Extension

A TIF district can be held open for one additional year beyond its planned or maximum duration to generate funds that will be used for affordable housing. 100% of the increment collected in that extra year can be used for housing anywhere in the City, with the stipulation that 75% must be used for affordable housing. More information can be found in section 66.1105(6)(g) of the State statutes.

Federal Low Income Housing Tax Credit (LIHTC) - Section 42 Housing

LIHTC (or Section 42) is a federal program which gives the Wisconsin Housing and Economic Development Authority (WHEDA) the authority to issue tax credits for acquisition, rehabilitation or new construction of rental housing for low-income households (see description on page 79). There are two type of tax credits available through this program: 1) Federal 9% Tax Credit (competitive) and 2) Federal 4% Tax Credit (non-competitive).

Wisconsin Low Income Housing Tax Credit (LIHTC)

Similar to the federal LIHTC program, Wisconsin offers a 4% non-competitive state tax credit which can be used as match for the federal 4% program (see page 79 for more detail).

Opportunity Zones

The Opportunity Zones Program encourages private investment in specific high-need areas. For census tracts to qualify for the program, they must meet one of five federal low-income criteria. If a census tract qualifies, a federal tax incentive is given to investors who bring private capital and jobs to the community. The incentive includes a permanent exclusion from capital gains if the property is held for at least ten years. Additionally, the investor can receive a tax deferral if the capital gains are reinvested in a state opportunity fund.

Four areas in the City qualify under this program . The City should continue to promote this program as these areas offer opportunity for private investment and development of workforce housing.

Downpayment Assistance

WHEDA and the Federal Home Loan Bank of Chicago (FHLBC) already have downpayment assistance programs which should be promoted. The FHLBC Downpayment Plus program provides matching funds which could be matched from pools of local employers or from the City.

Rental Conversion

Conversion of single-family homes to rental homes is a common occurrence in college towns across Wisconsin. Not all instances of this are undesirable, but these conversions can create concerns among nearby owner-occupants, including noise and excessive parking. Therefore it can be desirable for some of these renter-occupied homes to be converted back to ownership units.

The City has offered a conversion grant program which is currently on hold and being reviewed and modified to cover more projects. The City should consider the following changes:

- At least 10% must be used for exterior renovations.
- Increase the maximum grant amount

Partnerships **Habitat for Humanity**

Habitat for Humanity in Brown County uses volunteer labor and donations to build and renovate affordable housing. The City should continue the partnership with Habitat by working to maintain a supply of lots for new Habitat home construction. This will require a collaboration with various developers to arrange potential sites.

NeighborWorks

NeighborWorks Green Bay provides homeownership preparation services, downpayment and closing cost assistance, and affordable homes for sale and rent. The City should continue to partner with NeighborWorks to promote the services it offers and help it maintain a supply of existing owner/rental homes for renovation and lots for new owner/rental homes.

Major Employers

Major employers play an important role in the housing market in a community by bringing new people into the community or areas nearby. Employers have the best pulse on how many people they plan to hire, what their salaries (and budgets) will be, and what types of housing they may be looking for. The City should convene major employers in the community at least annually to discuss housing issues and initiatives in the City. The goal of the meeting should be a better understanding about changes in housing demand in the region. By discussing housing initiatives with employers, the City could help gain private sector support for developments which might be more prone to “not in my back yard” (NIMBY) sentiments. Major employers could be a strong partner in advocating for new developments and for advocating for changes in policies and regulations that support the development of affordable housing.

University of Wisconsin - Green Bay

The City should work with the University to update its campus plan every 5-10 years discussing physical enrollment and growth and that addresses any “objectionable impacts” the University might have on surrounding neighborhoods. A big component of this plan should be the University’s plans to house students within the community.

Northeast Wisconsin Technical College

The City should explore a partnership with NWTC and the Department of Workforce Development (DWD) to expand training programs for the unemployed or those seeking higher paid jobs in skilled trades. In particular, programs offering training in construction and rehabilitation of housing would be key areas for partnership. The City could consider partnering to provide financial assistance for people training in building trades.

APPENDIX A - SURVEY RESULTS

1. IN WHAT COMMUNITY IS YOUR PRIMARY PLACE OF RESIDENCE?*

2. IF YOU DO NOT LIVE IN THE CITY OF GREEN BAY, PLEASE INDICATE WHAT FACTORED INTO THAT DECISION (SELECT ALL THAT APPLY).*

3. IN WHAT COMMUNITY IS YOUR PRIMARY PLACE OF WORK?*

4. PLEASE INDICATE YOUR AGE:

5. PLEASE INDICATE YOUR RACE OR ETHNICITY:

6. WHAT IS YOUR GENDER?

7. DO YOU HAVE CHILDREN UNDER THE AGE OF 18 LIVING IN YOUR HOUSEHOLD? IF YES, HOW MANY?

8. DO YOU HAVE ANY CHILDREN OR DEPENDENT ADULTS OVER THE AGE OF 18 LIVING IN YOUR HOUSEHOLD? IF YES, HOW MANY?

9. HOW WOULD YOU DESCRIBE YOUR LIVING SITUATION?

10. ARE YOU CURRENTLY A FULL-TIME STUDENT AT ANY OF THE FOLLOWING?

11. PLEASE INDICATE YOUR EMPLOYMENT STATUS.

12. EMPLOYERS: DO YOU FEEL AS IF YOU HAVE BEEN ABLE TO ATTRACT ENOUGH EMPLOYEES TO GROW YOUR BUSINESS TO ITS FULLEST POTENTIAL?

13. EMPLOYERS: IN THE PAST 5 YEARS, HAVE HOUSING-RELATED ISSUES IMPACTED YOUR ABILITY TO ATTRACT QUALITY EMPLOYEES?*

14. EMPLOYEES: HOW LONG HAVE YOU WORKED FOR YOUR EMPLOYER?

15. WHAT IS YOUR TOTAL HOUSEHOLD INCOME BEFORE TAXES?

16. WHAT MODE OF TRANSPORTATION DO YOU USE TO GET TO WORK? (SELECT ALL THAT APPLY)*

17. HOW FAR DO YOU LIVE FROM YOUR PRIMARY PLACE OF EMPLOYMENT?

18. HOW LONG DOES IT TAKE YOU TO TRAVEL FROM HOME TO YOUR PRIMARY PLACE OF EMPLOYMENT?

19. WHAT TYPE OF STRUCTURE DO YOU LIVE IN?

20. HOW MANY BEDROOMS DOES YOUR CURRENT HOME HAVE?

21. WHAT WERE THE IMPORTANT FACTORS IN DECIDING TO LIVE AT YOUR CURRENT RESIDENCE? (SELECT ALL THAT APPLY)*

22. DO YOU RENT OR OWN YOUR PLACE OF RESIDENCE?

23. RENTERS: APPROXIMATELY HOW MUCH DO YOU CURRENTLY PAY FOR YOUR HOUSING EACH MONTH, INCLUDING RENT, INSURANCE AND UTILITIES?

24. IF YOU ARE A RENTER, WOULD YOU CONSIDER LIVING IN AN ACCESSORY DWELLING UNIT (ADU)/GRANNY FLAT/ MOTHER-IN-LAW SUITE?

25. IF YOU OWN YOUR HOME, WHAT IS YOUR MONTHLY COST, INCLUDING UTILITIES, MORTGAGE PAYMENTS, TAXES, ETC.?

26. HOMEOWNERS: WHAT IS THE APPROXIMATE ASSESSED VALUE OR YOUR HOME?

27. HOMEOWNERS: IF YOU WERE TO SELL YOUR HOME RIGHT NOW, WHAT DO YOU BELIEVE WOULD BE A FAIR MARKET PRICE?

28. HOMEOWNERS: IN THE PAST 5 YEARS, HAVE YOU INVESTED MORE THAN \$2,500 IN IMPROVEMENTS TO AN EXISTING HOME, NOT INCLUDING STORM OR FLOOD DAMAGE REPAIR?*

Common "Other" Responses:

- Flooring
- Landscaping
- Roof

29. HOMEOWNERS: IN THE NEXT 5 YEARS, DO YOU INTEND TO INVEST MORE THAN \$2,500 IN HOME IMPROVEMENTS?*

30. IF YOU OWN YOUR HOME, WOULD YOU BE INTERESTED IN ADDING AN ACCESSORY DWELLING UNIT (ADU), GRANNY FLAT/ MOTHER-IN-LAW SUITE TO YOUR PROPERTY?

31. IF YOU OWN YOUR HOME, WOULD YOU BE INTERESTED IN PURCHASING AN INVESTMENT PROPERTY TO RENT OUT?

32. HOMEOWNERS: ARE YOU CURRENTLY RENTING YOUR PRIMARY RESIDENCE AS A SHORT TERM RENTAL (E.G. AIRBNB)?

33. IN THE PAST FIVE YEARS, HAVE YOU HAD TO FOREGO OTHER NEEDS SUCH AS FOOD, HEALTHCARE, OR CHILDCARE TO ENSURE YOU COULD CONTINUE TO PAY FOR YOUR HOUSING?

34. WHAT IS THE CONDITION OF YOUR HOME OR APARTMENT? CONSIDER BOTH THE BUILDING SYSTEMS AND THE INTERIOR AND EXTERIOR FINISHES?

35. IF YOU WERE TO MOVE IN THE FUTURE, WOULD YOU RATHER RENT OR OWN YOUR HOUSING?

36. IF YOU WERE TO MOVE IN THE FUTURE, WHAT TYPE OF STRUCTURE WOULD APPEAL MOST TO YOU?

37. ARE YOU CURRENTLY PLANNING TO PURCHASE A HOME SOMEWHERE IN THE NEXT 2-3 YEARS?

38. IF NO, WHAT ARE THE MAIN BARRIERS TO PURCHASING A HOME? SELECT ALL THAT APPLY.

39. WHAT IS THE ANTICIPATED AMOUNT OF FUNDS YOU WOULD HAVE AVAILABLE TOWARD A DOWN PAYMENT FOR HOME PURCHASE?

Most Common Responses:

- \$10,000 (36 respondents)
- \$5,000 (35 respondents)
- \$20,000 (21 respondents)
- \$50,000 (19 respondents)
- None (10 respondents)

40. HAVE YOU PERCEIVED CHANGES IN HOUSING OPTIONS AND AVAILABILITY IN GREEN BAY OVER THE PAST 5 YEARS?*

Most Common Response:

- Difficult to find quality, affordable housing.

41. IN YOUR OPINION, WHAT EFFECT DO EACH OF THE FOLLOWING ISSUES HAVE ON DECISIONS TO CHOOSE HOUSING IN GREEN BAY?*

42. IN YOUR OPINION, WHAT ARE THE GREATEST UNMET HOUSING NEEDS IN GREEN BAY RIGHT NOW? (SELECT UP TO 3)

43. IF THE CITY WERE TO USE/CREATE PROGRAMS THAT TARGET A SPECIFIC HOUSING TYPE, IS THERE A SPECIFIC TYPE OF INVESTMENT YOU FEEL WOULD HAVE THE GREATEST BENEFIT?

Common “Other” Responses:

- Affordable housing
- Options for homeless or people at risk of homelessness
- Affordable housing for seniors

OPEN-ENDED RESPONSES

1. In what community is your primary residence?

- New Franken by address, services provided by Green Bay
- Wrightstown
- Kewaunee County
- Parents
- Hobart
- Pittsfield
- Hobart
- Town of Morrison
- Hobart
- Hobart
- Sobieski
- Appleton
- Oshkosh, WI
- Village of Hobart

- Brown and Outagamie County
- Pulaksi
- Currently Manitowoc but hope to move back to the Green Bay within the next couple of years.
- Oconto
- Oneida/Hobart
- Wauwatosa
- Madison, WI
- Village of Hobart
- What do you want me to say
- Village of Hobart

(for now)

- Hobart
- Village of Hobart
- Village of Hobart
- Kaukauna but work in Green Bay
- Hobart
- Hobart
- Town of Eaton
- Village of Hobart
- Bay settlement

2. If you do not live in the City of Green Bay, please indicate what factored into that decision (select all that apply).

- City is dysfunctional.

- Rent is too high
- Crime
- Live closer to a previous job in another county.
- Moved in with my partner
- Anything affordable is shitty and looks ready to be condemned
- Living with family
- Location of St. Norbert Abbey
- I just happened to find a place in De Pere before I found one in Green Bay
- Space and distance

from busy city	wanted to be in that area	the parochial school our kids attended.	there but found home in Allouez
• Live in city	• lived in this home for 29 years	• I live in an apartment, and this is what turned up when I was looking.	but that was over 20 years ago.
• Serendipity	• quiet place to live	• Based out of MKE area	• Lack of innovation and close minded government
• First housing available that accepted my section 8 voucher	• out grew the home wanted a larger yard on a less busy street	• No affordable housing	• Nice neighborhoods were too expensive and cheap neighborhood were scary. No solid middle ground in the center.
• Was available when I was looking.	• No reason	• The house we liked ended up being in De Pere	• river access
• Location.	• Not a lot of acres, or space with standard city size lots	• Better Schools and Higher Paying Job	• Was in GB moved to better neighborhood
• Where I found condo that fit me	• Lack of confidence/ leadership with City Council, Alderman and Mayor(s)	• Wanted a large lot for a new house	• Taxes to high
• This is just where the house we wanted was located	• wanted to be in the country	• composition of the city council and its lack of genuine leadership	• Just liked this house
• More space & quieter neighborhood	• We downsized a couple years ago and the house just happened to be in Bellevue.	• Rural living	• Number of dogs/ cats too restricted
• Moved to take care of family next door.	• our program is for reservation boundaries	• The price of the house and lower taxes.	• Zero lot line duplex..I own my half
• Used to live in GB, but to many people renting properties to just to have them rented, so a lot of trash moved into GB. Wanted a safer community.	• Neighborhood/ safety	• I have not found any land I am comfortable with in Green Bay	• I'm retired
• Need more options downtown for groceries.	• Have a dog	• I found a house I like in De Pere.	• Just the house I bought was in ash-waubenon
• Quality of rental housing	• Moved in with my daughter.	• De Pere Has always been my home. I love it here.	• My former Job. I'm recently disabled, so I retired early.
• Have always grew up in Howard	• Property on river	• I live in Howard/ Green Bay (54313) and that's because of housing that was available to meet our needs	• Bears fan
• We are now retired but built years ago to be close to our jobs at that time.	• lack of places that accept cats for houses and duplexes	• Larger parcel of land	• House was available
• Discrimination.	• Found the condo I wanted in De Pere, after living in Allouez for 42 years	• NA	• Mas tranquilo
• Crime rate too high	• Specific house I wished to live in	• Country living with more land	3. In what community is your primary place of work?
• Quieter area	• We bought a home in Allouez in 1965, and built a home there in 1972 and are still there. At the time, we liked the suburban character, not having to deal with river crossing, and easy access to	• I chose my house to live in the Southwest High School Boundaries	• Harrison
• We've lived in the Village of Suamico since 1994; liked the rural feel while still being 15 minutes from downtown. Husband grew up in a rural area.		• We were looking in east de Pere as we had always lived	• All of Brown County equally
• My husband lived in De Pere and he			• Sturgeon bay

 - Bought from a friend

• Family home • Amenities (washed&dryer, garage, etc.) • I liked the apartment's old world charm. • Central air • Scenery • Attached garage • Green Bay Packers • View of the bay • It's paid for • Cost was a factor, but mostly what we could get for our money and how reliable the investment felt... would we get it back someday and were others investing and maintaining their property. • Sold mobile home • Family home • water access • Although shopping/grocery is important, being close to downtown/the Broadway district (along with my child's schooling) is a huge factor: living close to downtown means we can actually have a life when the buses aren't running. Being close to grocery and shopping isn't so great if we are too far away from recreation and living. • Lots of land • Family • Pet friendly • Trying to report illegal activity so neighborhood im-	proves so I can sell and MOVE OUT of GREEN BAY • Inherited property, but my selection is based off of deciding factors that I would highly consider, and Safety • Yard! • Availability • Lambeau and attached garage for pets • Owned and lived in home since 1973 • Moved in with partner • Purchased as an owner occupied investment property • Central air, a space for a garden, and the feeling • Rent amount • Pet policy • Small enough to maintain despite disability • Pet Friendly! • Husband already owned • Couldn't afford my own place and school districe • That one new brewery by that place • Yard for my dog • Porque tengo 4 hijos y tenía que separarlos • Las escuelas estan con distancia para caminar. 28. In the past 5 years, have you invested more than \$2,500 in improvements to an existing home, not including storm or flood damage repair?	If so, approximately how much have you invested? • Windows roof heating and cooling • New roof /windows • Roof, fence, windows, water heater, furnace, interior improvements • New windows, deck, plumbing improvements, landscaping, new basement insulation, interior painting, kitchen repair, General maintance. • Fixtures, appliances, doors, furnace • Landscaping & regrading, redone cabinets in bathroom and kitchen • Finished basement, fenced yard, replaced flooring • Fence, flooring • Hardwood floors installed, finished basement • Roof, hot water heater, Plumbing • New windows and siding plus wood fence • Furnace • air filtration system on furnace because of the coal piles, and water heater • Fence, new boiler, washer and drier, paint • Finished basement • Updates to floors, bathroom, kitchen and ac. • Bathroom , roof, new window, paint • New windows, new	furnace, new flooring • Doors, windows, furnace, A/C, • Renovated north entrance • Hvac. Insulation. Lighting. Bathroom remodel • we have done various remodelings and then we have done Roofing as well as siding and new windows • New roof in 2019 • Roof, bath, flooring • Cosmetic, landscaping • New flooring, paint, leaking basement fixed. • Basement windows, deck, bathtub replacement • Deck, windows, roof, furnace, interior remodeling • Driveway, roof,painting • New water heater, paint, bathroom floor, outside landscaping. • New windows • Fence, landscaping, interior upgrades. • Remodeling • New furnace and AC • New windows • Remodeled kitchen and bathroom, hung new drywall in master bedroom and living room then painted those rooms, new carpeting in both bedrooms and living room, vinyl flooring
--	--	---	--

in kitchen bathroom by and hallway, new baseboard trim and doors in living room both bedrooms kitchen and bathroom, upgraded electrical system to a fuse box and put in new wiring, and black topped out driveway. • Replaced windows • “Landscape curbing • Wet bar” • New roof • Flooring and kitchen • “Bathroom remodel • Kitchen remodel “ • Windows, bathroom, carpeting • Complete remodel, flooring, kitchen, light fixtures • New Windows, trim work, landscaping • Painted exterior, water control in basement • Windows, roof, garage door • New roof \$13K, paint 3K • New driveway • Sun room attached garagw • Replaced water pipes • Basement remodel • Reconstruction of the back half of our house due to water damage and age • Furnace/ac, roof, fence, landscape, paint • New flooring, significant painting, deck restoration. • Roof, hardwood	floor, new toilets furnace air conditioner insulation • Remodeled bathrooms • Windows, doors, back yard. • “Kitchen, Bath, widows, furnace, air Plumbing” • Repaint kitchen, main living area, bathroom, and 2 bedrooms; new furnace and central AC; new doorbells and outdoor security camera system; complete bathroom remodel down to the studs: new flooring, fan, light fixtures above the sink and vanity, paint, drywall, plaster, electrical, plumbing, toilet, sink, faucets, shower, tub, mirrors, fans and linen cabinets; refinish all hardwood floors; kitchen remodel: new counters, toe kicks, sink, faucet, stove, and wainscotting (in the eating area), new light fixtures with individual fans in the main living area for each of the two rooms; new washer and dryer hoses for the existing machines in the basement; moisture barriers for the crawl space; complete replacement, leveling and regrading of the outdoor patio w/ new patio	paver bricks; sealing outdoor leaks with expansion foam to keep out water and other critters; installation of new hardwood door jams and reducers to cover gaps in the floor between rooms • Remodel, painting, • Variety of home projects • Remodeled bathroom and landscaping • Remodeled bathroom. • Fence, landscaping, flooring • Windows, deck, fence • New furnace, new roof, pressure tank • New door and screen doors, lighting and painting. New walk in shower. New double concrete driveway and walk up area. • Roof and gutter repair, upgraded electrical panel, installed overhead lighting throughout, installed fence around the back yard, painting, replaced old door-knobs, installed new garage door • New windows, flooring and painting inside rooms. • “Built an addition • “ • windows - ac - furnace • New heating system • Landscaping	• New roofing 20,000 • Leaf guard gutters • Roof repair, plumbing repair, house painting • Fixed basement walls and updated basement, added fence • New windows, doors, gutters, downspouts n gutter tops. Trimmed my huge tree in the backyard too. Patio doors. Upgrade to my kitchen w new granite countertops and new cabinet doors. • windows, painted and resealed the basement, new gutters, • Landscape • New roof, new hot water heater • Paint house, windows, install patio, weatherized basement, upgraded bath, replaced main line to home • window pane (glass only) replacement, landscaping, carpet replacement • Curb appeal • Updated bathroom and deck • New kitchen cabinets, interior and exterior doors. - Redo kitchen flooring, cabinets, new driveway
- Bathroom remodels
- New gutters and gutter guards, additional fencing for pets add egress window and room in basement, maybe remodel kitchen
- Fence
- New roof and sheathing on second garage, new water tiles, upgrade both bathrooms, refinished/new flooring and carpet throughout entire house, new counters, trim, 2 windows, doors, sections of exterior vinyl, landscaping, fixtures. A lot of work to sell.
- Central air
- roof, basement,
- Fence, patio
- We need a roof. We need to replace the fence. The basement needs a sump pump. The main drain is full of roots and needs work and our foundation is cracked...
- Install a garage tub/wash area.
- Siding
- Sofets and gutters replaced
- Would add a room downstairs but I'm getting raped by the city
- Sidewalk and driveway
- Yard improvements, electrical
- Landscaping
- Flooring throughout house, kitchen countertops, landscaping/deck
- 2 bathroom Remodels and replacing more flooring
- HVAC
- new flooring
- Whatever breaks
- Updated kitchen and bathrooms and landscaping improvements
- Deck, outdoor areas,
- Garage, driveway, basement
- New doors, Patio, Landscaping
- Garage
- Bathroom remodel
- New fence
- Indoor remodeling
- Kitchen remodel, fencing
- Roof
- New fence, kitchen renovation
- Roof
- replace some appliances, rebuild deck
- More flooring and other bathrooms built
- Bath remodel, patio replacement
- Replace driveway
- New roof. Updated bathroom.
- Roof? Replacement front & back doors.
- New driveway
- Kitchen and bath remodel
- Sun room finish basement
- Bathroom remodel
- New roof
- New roof
- Repave driveway, repair or replace windows, new roof
- Siding, driveway redone, kitchen remodel, flooring
- New roof on current home
- Updates. Gutters, downspouts, kitchen.
- Windows, doors, deck repair, water heater
- Pave the driveway
- Baño y piso
- Mejorar Los cuartos y el baño
- Poner fence
- Replastering, replace siding, renovate kitchen, closets doors and stairs that go through basement,,
- Ruf y siden
- Roof siding dance etc
- Techo

33. In the past 5 years, have you had to forego other needs such as food, healthcare or

childcare to ensure you could continue to pay for housing?

- Wife had Breast cancer
- But I know several people who have, especially young families
- Rents are crazy high! Having to choose between food or rent because wages are too low for what you pay for rent which is very high and sometimes you end up owing. This are hard times!
- Every month it's either food or I pay my rent it's insane!
- Used my credit card for groceries and gas
- have not been able to afford medical insurance since Sept
- I've lost my home to pay for child care though
- I currently work part time to be able to go back to school. Because I'm working part time, we are without health insurance and using free clinics. We don't qualify for rent subsidies and our large family (6) and need for 4 bedrooms makes it impossible to find cheaper housing.
- Wives health insurance
- No extra hardly had money to pay rent.. food clothing as my young child is growing fast birthdays canceled because had no money
- Had to reschedule certain medical appointments because we didn't have the money for the copay
- Employment issues past 2 years
- Our so called health care system sucks!
- Formerly in a DV situation
- Food and letting my kids play any sports
- Housing in Green Bay has become so high. I've transferred back from out of state and pay up to 200.00 more a month for the same type of dwelling. I'm originally from GB. Everyone is a "flip" expert now and doubles rent
- Debt is a thing. Duh.
- Healthcare, car insurance, & childcare
- I will when I retire in a couple of years.
- I went without healthcare until now
- Healthcare
- Food
- Dental... low cost dental is a serious & ongoing problem here
- Healthcare
- When we previously lived on the west side of Green Bay our rent was \$1400.00 plus all utilities. We were living paycheck to paycheck
- Healthcare
- Used credit cards when roommate stopped paying her share of rent.
- Even with a Section 8 voucher, money is tight
- Healthcare, job loss
- When unemployed
- Dental work and health care needs
- Thankfully we have family to help with childcare. Otherwise things might have been different
- this is what life with a disability is, folks.
- No, but we haven't been able to save much for rainy day
- I was unemployed for a few years. Paying our mortgage was very important
- I have had to forgo food to pay my rent
- decreased quality of services so we could pay easier
- Healthcare
- I have not, but many of my friends, colleagues, and family members have been faced with this choice.
- Electric
- If not for ics.project based housing voucher
- Defaulted on credit cards to maintain housing and basic necessities
- I have concerns about being able to continue living with the skyrocketing cost of rent and still tending to other bills.
- Healthcare
- I have put off nonessential things that will eventually become essential because I don't have enough after housing expenses to cover it all
- I have no health care
- Food
- regarding previous rental questions, we already own rental units and are at the stage of our lives that we are more likely to downsize than acquire more.
- I have food share
- food
- Most of the improvements were made possible by Green Bay Redevelopment. Medicare does not cover some healthcare needs, which we can't afford. I pay our mortgage first.
- Car insurance, health insurance are too expensive- rent is more important
- We go to Paul's Pantry because we can't afford food.
- Health care, dental, etc.
- all of the above.
- I am fortunate that we are on Badger-Care, FoodShare (although we do not get enough to enable us to eat healthfully and have enough for

the whole month), and ICS/Housing. My mother helps with the rest.	• 15000 • 30,000 • \$100000 • ?	• 70000 • 15000 • 5,000 • \$4,000	• Idk • \$10,000 • 1,000.00 • N/a
• I am fortunate that we are on Badger-care, FoodShare (although we don't get as much as we actually need), and ICS/Housing takes care of the bulk of my rent. If the rent were any higher, though, we'd be on the street--it's extremely difficult to find quality housing under \$800, close to town, and accepts ICS/Housing..	• Depending on what our current house would sell for, approximately \$10,000-\$20,000. • 15,000 • \$5000 • 5000 • 5-7000 • \$50 • Unsure now, due to our current situation with COVID 19	• Currently, my husband attends NWTC and will be graduating with his welding certificate. There's so much up in the air until he gets a job. Then we'll be working on digging ourselves out of debt for a while. • Would depend on what my current residence would sell for.	• 30,000 • 0 • I do not have funds for a downpayment • 3000 • \$50K • ~\$20,000 • 5000 • 75000 • None • \$5000 • I would rent so \$1500 to move in • 100,000- 150,000 • \$6000 • \$10,000 • \$5,000.00 • \$2000 • \$50,000 • 15,000 • 0 • 50k • Not sure 3% down? • \$2000 • 20,000 • 3,000 • \$50000 • \$5,000 • n/a • \$50,000 • 5000 • 15,000 • Prefer not to say. • 10,000.00 • \$25,000 • 20,000 • Depends on dental expenses (thousands).. without those possibly \$10,000... but being low income w/o health or dental makes everything up in the air. • None • \$3,000-\$5,000
• Luckily I have others to live with and help cover bills • Lost job 3/2019 after 24 yrs • I budget according to rent. • BUDGET!!!! • Our rent prices are very fair for the surrounding market we choose. • Like to get a new roof but can't afford it • Healthcare • I was able to make an 8 year payment arrangement	• \$100,000 • ?? • 3000 • 50,000 • ???? • 15k • 1000 • Unsure • 12000 • 25,000-40,000 • None right now my bills are to high • \$3,000 • 0 • \$10,000 • 10000 • \$10,000 • 2,000 • < \$5,000	• 4,000 • 0 • none-VA loan eligible • As little as possible • \$0 • 30000 • Nothing at the moment as I'm off of work due to the town being shut down. I get no assistance at all • 30000 • 0 • \$15,000-\$20,000 • \$0 • 20% • \$2000 • \$10,00 • 2,000 • 70k • No clue • 20000 • 5000 • 5000 • Not sure, the lowest down possible if the rates are still low. • 30k • 40,000	
39. What is the anticipated amount of funds you would have available toward a down payment for home purchase?	• 1,000 • ? • 50000 • Currently none. After I graduate and am working full time, I'd like to save \$10k for a down payment. • 10000 • \$20,000.00	• 2000 • 2,000 • 70k • No clue • 20000 • 5000 • 5000 • Not sure, the lowest down possible if the rates are still low. • 30k • 40,000	
• 50,000 • \$20,000 • None of your business • 3,000 at least

- 40. Have you perceived changes in housing options and availability in Green Bay over the past 5 years?**
- Property is much more expensive than 5 years ago- it’s a sellers market. We love the new places being built downtown, especially the Whitney Apartments, but would never rent for that price when we can own a home for less. But, if they were selling units, we’d be interested.
 - Renting in the city is hard at times with unresponsive, unorganized landlords and third party property management
 - To many luxury apts being built, and nothing affordable for young families who dont receive housing or other assistance. Nothing nice for elderly people either
 - Affordable housing in a lower middle class price range has been extremely competitive in the last few years. Especially in specific neighborhoods.

- Just moved here but it has been very difficult to find affordable rentals
- So I many irresponsible landlords, too many people tolerate drug houses
- It's very difficult to find, good affordable housing even for a single parent or person. Anything affordable is very slummy looking in a bad neighborhood
- Very few good AFFORDABLE units
- The cost is very prohibitive
- Housing costs have gone up and wages have not. More people looking for 'cheaper' housing. Taxes are higher.
- Neighborhoods with affordable housing is no longer safe for a family. The safe neighborhoods are very inaccessible for middle class future home-buyers.
- We have a cat and a dog, finding a place to rent, that's still nice is extremely difficult. We got lucky where we currently are.
- We have a dog.
- More available, and the prices continue to rise to the point of being unrealistic
- Landlords need to stop charging Chicago rents - no employer here pays Chicago wages
- There are a lot of
- unaffordable building popping up around downtown
- It has gotten SIGNIFICANTLY more expensive to rent a 3-4 bedroom home.
- We were nearly homeless a couple years ago because of the spike in rent and our poor credit
- Haven't looked in 25 years but would be interested in a smaller version of a single family home or attached town-home with minimal maintenance.
- To many bad landlords that do not maintain their properties.
- Landlords are being very selective to whom they rent to, leaving many without options
- More costly to rent
- I worked in property management for the last 10 years and saw that there is a real shortage in affordable apartments. Under \$700.
- Things are way over priced right now.
- Housing prices have gone up . 60% of my income
- It saddens me to see so many new apartments, townhouses and condos being built that are catered towards people who can afford \$1000+ for rent when there is such a huge need for affordable housing in our area.
- Please stop making more housing, too many people here is making crime go up and run low on resources. I hate more and more people moving here it's making green bay worse, not better.
- Too much luxury apts vs affordable.
- Rents have gone up only slum lords accept housing assistance it is very frustrating
- I moved back here in December 2018 after about 27 years in Nevada.
- I was a home owner for 27 years..now rent. Way to many subdivisions geared toward higher income residents... to many highrise apt geared toward higher income as well. not enough 1 level apt. Senior housing is always just as expensive. Lower income areas are not safe.
- Housing is simply too expensive
- This city is overpriced considering the quality of most rentals, and incredibly unfriendly to pets.
- Have friends who are homeless
- Price of decent homes for first time buyers is extremely high
- Rent in Green Bay is expensive
- Rents are too high.
- Apartment rent so high
- More costly!
- It's impossible to find reliable, affordable housing, especially for those who are in the 0 to 30% of the County Median Income.
- We bought our house last year. It was hard to get a house in this sellers market. I felt most houses were also over priced.
- Affordable housing is very difficult to find. Everything "decent" or on the "nicer" end requires a great credit score, monthly income of 3x the rent, or other factors that may automatically disqualify a person even though they could still pay rent. What is considered "affordable housing" is run down, in unsafe or rundown areas around town and most have very crappy landlords. The units and tenants are not taken care of. Just because people have a lower income doesn't mean they should have to be treated like crap and be forced to live that way because no one else will give them a chance or charge a ridiculous amount

- in rent.
- Not a lot of entry levels homes are available in the \$100,000 and less range that don't need a ton of repairs and/or updates
 - Much development but prices are too high
 - Looking for new places to rent it was hard to find anything with a good price and in good condition.
 - Rents have increased, although wages don't appear to be keeping up in this area at all.
 - I didn't even want to buy a house here, to be honest. But I had little time & ended up getting a cheap old home in a sorta crummy area (basement floods for days in heavy rains, almost yearly, sometimes more than one event). Now I feel attached to it like a ball & chain. I'd rather be in de pere, a couple areas in west gb, or out in the country or woods. Unlikely tho.
 - A lot of these questions are not applicable to me.
 - My daughter has been looking for adequate housing for the last 5 years it's hard she doesn't have the greatest credit due to student loan debt. The rent is way over priced for what it is. There are some landlords in the city that should not be able to take housing for the conditions of their property for the amount of rent they are charging. I would love to purchase a house in the city if Green Bay for my daughter but at the time the house are overpriced I'm not paying more than fair market value. I would like to have her rent from us because I know it would be clean and well taken care of, however she cannot get any help from housing with renting from a relative. I think there are many people in the city in the same situation. It's hard for a single person to make it go. I can understand why so many are homeless. If you do find something affordable it's usually a high crime neighborhood. The property taxes are also high in the city for some of the places I've looked at compared to adjacent towns and villages.
 - Rents have gone up as the rents were deflated for so long since 2008. Landlords are finally getting a break to find good paying tenants and pay off their mortgage. Not sure what is going to happen with the new law telling us we can't evict for nonpayment of rent for 60 days... by the time landlords get a court date it could be 4+ months they are squatting and forcing landlords to not get in a new tenant. Nothing was said about helping landlords. There has been much new construction, that will soon ease the shortage.
 - Housing prices are higher
 - The rental market for houses (either single family or duplex) under approx \$1200/month is BRUTAL. Places big enough for a family are getting two dozen applications before the showing even happens, which often costs money per application. My partner and I spent something like \$200 on application fees last year before we found our place, which we could absorb, but a lot of families can't.
 - Too few decent non-smoking senior apartments. I am looking in other counties now.
 - Adequate housing means buildings that are not water damaged and in disrepair. That is harder to find in Green Bay, especially in the NW neighborhood where we used to live. That's part of the reason we left the city.
 - There is a lack of quality housing
 - Rents are skyrocketing!
 - At least in the De Pere area it's gotten harder to find adequate housing.
 - Would like to move to some of those new apartments but with my home being paid off I can't see paying such high rent for a single or a two room place. Especially I'm on a fixed income.
 - No landlords are taking housing. (Bluefrog mostly)
 - Family member has been trying to find a affordable apartment for 3 months. Makes just over Low Income threshold so options are limited and most often in bad condition.
 - Too many apartment buildings going up in the same area. We would love to rent a ranch house rather

- than an apartment here in our area but haven't seen any available.
- Plenty of housing avail on green bay covering all price points
 - I am a professional and looking to move but I can't find a unit that is below \$750. I don't want to spend so much money on a one bedroom, the prices are crazy and that is all the new ones seem to be at for price.
 - We just moved to Green Bay in June 2019.
 - We are looking for a deluxe, first floor, 3 bedroom apartment in s safe neighborhood, which will accommodate our elderly residents with some physical limitations, and limited maintenance .
 - can't find anything affordable...so this question doesn't make sense to me. I guess housing is there just not affordable for me so if I can't afford it the housing isn't available
 - I work with households trying to find rental housing and it really hard to find vacant affordable units.
 - I work at a shelter, housing for clients
- has always been difficult.
- Affordable housing remains a concern for those with limited means.
 - I'm a landlord and housing market prices have increased causing rent prices to increase
 - moved to Green bay recently
 - For a single person, it is hard to find a low cost option (<\$600/month) in a nicer area (with allergies - need own laundry)
 - There is not affordable housing in Green Bay
 - Houses in my price range go quickly
 - Lots of high priced apartments have gone up!
 - Rents are going up, number of units available has gone down, safe neighborhoods that are affordable and walkable don't really exist in Green Bay proper anymore.
 - As someone who uses a wheelchair it has always been difficult to find accessible housing within our price range.
 - Rental properties are priced too high for the condition and amenities offered.
 - There is a shortage of condos available.
 - Would have rented
- but rent costs are twice ownership cost, doesn't make sense
- Rent prices are very high
 - Seems like renting in Green Bay keeps going up, so a lot of people I meet are couples who split rent because they can't afford it on their own.
 - "New builds are targeted for higher end client, ie high rents.
 - Been in the GB area for 30 yrs & affordable housing in a decent neighborhood has gotten extremely hard to find and/ or nonexistent. "
 - "I was a buyer in a seller's market. Prices of homes higher than they should be at. Bids going even higher and fast. Difficult to be a part of that process.
 - People do not keep their homes updated or beautify the landscape of their property. "
 - I'm looking at the mobile home sites lately
 - It seems like a majority of the housing options; high rise apartments/condos are being built along side or near the waterfront of the Fox River. Having said this most are either
- out of my price range, require using an elevator (I have a small dog and transporting groceries could be a nightmare). When I'm ready to purchase I'm looking for an affordable (\$125K - 185K) ranch style condo or townhouse with my own entrance, garage and basement. On a side note there's a shortage of assisted living residences in Brown County. With more and more people living longer then before there's a waiting list to get into a majority of the current places. In developing the area known as the "railyard" that would have been an awesome place to build an assisted living residence with some rooms, dining and gathering space facing the water. Could even be a multi-level building too.
- Prices up, snapped up quickly.
 - There are definitely more housing options in Green Bay today, but cost and other factors (such as prior renting history, credit) still present significant barriers for a large portion of our community's residents.

- I have heard that there is a housing shortage. I was amazed at how fast houses were selling when we bought out house in the spring of 2018.
 - “Pets not being accepted ..I NEED A PET FOR EMOTIONAL support “
 - Credit and tenant history is strict.
 - No one accepts ICS
 - No condos for middle income
 - “There seems to be a radical extremes of what is available for ‘regular’ people just trying to live. Not everyone wants or can afford a 1500/month condo.
 - “
 - Market is very competitive for my price range. Hard to find a decent home in a decent neighborhood for \$120,000.
 - Single family dwellings are getting more expensive and it seems that the new apartments, condos being built are far to expensive for working people.
 - Rent has been rising much faster than the cost of living increase for SSDI beneficiaries. I am looking to move to an low cost(HUD/ Section 8) elderly/ disabled living community to ensure
- I never become homeless or have to live in a slum lord type situation because of the the huge spike in the cost of rent in Green Bay/Brown County. The wait lists for these type of residential community buildings is too long. We need more low cost housing for both the elderly/ disabled population and for the general population struggling to find low cost, but safe, living options in Brown County. Many of the new residential building in Green Bay seems to be geared for those who are classified as middle income or higher financially, rather than the low income/working homeless population. This needs to change.
- no desire to live in GREEN BAY
 - affordable workforce housing is very hard to find. I did consider selling and renting; however, it is impossible to find quality housing that is affordable.
 - I live in Fort Howard. I do not like seeing such a heavy rental neighborhood. :(I feel like there is too much transition of people
- here. I notice how rentals are not taken care of and the lack of home pride. I have seen Neighborworks and Habitat Builds being added here and I wish there were more options and communication for funding for existing homeowners.
- Average cost of apartments continues to rise
 - I think finances are a challenge. In our economy many people can't afford a home because the costs of living in and maintaining a property are beyond their reach. I have also noted that there is still some discrimination in who gets loans or bids approved.
 - It seems that there is a lot of new housing along the river, but many of the rents seem out of reach for the average person/family.
 - I have purchased a second home in Green Bay for weekends and live during the week in Madison. I purchased an older home with garage for \$50,000 in GB. I would not want to live there full time because the schools are ghetto, there is no coop or grocery store nearby
- and the neighborhood is very rough. Shootings and thefts occur often.
- We are fortunate with housing, but it seems that affordable housing is getting much harder to find.
 - Good housing is too expensive; poor housing is plentiful and cheap
 - We've only lived here about 5 years. We first rented an apartment before buying our current home about 1.5 years ago. The housing market was competitive and probably still is except for the coronavirus.
 - Currently looking at leaving Green Bay because rent is cheaper in Howard
 - In search of 5 bedroom house there are not many affordable options
 - Housing, in general, was harder to find.
 - With housing prices going up, it's become more difficult to find affordable housing that doesn't need lots of updating/repairs. Homes are still much more affordable here than in other areas of the US though.
 - reading about newer housing options that are appearing in Green Bay, my first

- thought is “Wow, who can afford that!” Rentals seem high priced.
- If I were to move, I’d be very interested in one of the homes Neighborworks has rehabed.
 - Low amounts of homes for sale
 - Still looking
 - Have not personally looked, but as an agent the housing market has certainly changed.
 - Prices are too high for my income
 - Home prices have increased
 - Rents too high and it just keeps going up..
 - There appears to be more options in the community overall. Those options seem to be for those with significant income verses options for those with housing struggles.
 - “Havent had to look but notice many many apartments and condos and wonder where all the people are coming from to fill them.
 - “
 - There has always been adequate housing
 - “I have a therapy pet(dog)! People want illegal deposits and monthly fees Federal Law they CAN’T charge under Disabilities Act!
 - Housing in area DOESN’T want to accept Federal Housing Vouchers either!”
 - Decent housing (safe) with amenities (washer and dryer in unit with a garage) is extremely hard to find for under \$900 in the Green Bay Area
 - Rent has skyrocketed and most new apartments built are high end rental units. Not enough for middle and low income.
 - Affordability upon budgets
 - We wanted to rent when we moved here in 2017. Renting was more expensive than buying partly due to the use of a VA mortgage.
 - I’ve noticed that the city is becoming more gentrified. Many in my generation can’t afford the places that are being built around the city. Yeah, there is more housing options, but I/we can’t afford it.
 - Not everyone can afford high rent.
 - have not been looking in this area; next permanent move will likely be out of the region
 - Rent too expensive for fixed income elderly
 - Affordable housing doesn’t exist in the area. Definition of affordable is way off base.
 - I’m a school social worker, and I support many families who have found it nearly impossible to afford adequate housing. Some families have even become homeless or remained homeless because of inadequate affordable, safe housing options in Green Bay.
 - Not enough family housing that has 3 bedrooms or more that is affordable.
 - Desperate need for safe, in good repair & affordable housing.
 - Obviously the cost has increased
 - Wish there were more stand alone or duplex condos on west side of city. He
 - “It is sad that the quality of housing stock in Green Bay has been allowed to deteriorate. We need to find a less regressive way of taxing those who actually maintain their properties! As a homeowner, I feel that the city has been against me at every turn. My neighbors all have taken the time to speak to me in person about how the neighborhood has improved since
 - I bought my home here..
 - “
 - Actually affordable, cheaper housing (apartments) tend to be in very poor condition or in undesirable areas. Modern “Affordable Housing” is outrageously priced for the area and tough for two full time spouses to afford and build a savings at the same time. I can’t imagine finding comfortable, and affordable housing with children factored in.
 - There are more apartments available with new complexes being built, but not many that are affordable and in a safe neighborhood.
 - “Neighborhoods in Green Bay are unsafe, and lack good quality of life.
 - Availability isn’t an issue as I do not wish to live in Green Bay, much less own property here!”
 - Single level, ADA compliant condo!!
 - We need to allow people to build in law suites and such. Green Bay is too picky about dumb stuff like this. It’s good for our community, more living space and we get to help & assist others.
 - Low income housing (section 8)

- scarce.
- Prices are going up. Nicer buildings are being built but they're too expensive for the average person, which then drives the cost of other apartments up as well.
 - New builds are WAY TOO EXPENSIVE. Even old, run down apartments are more than my mortgage!
 - I have only lived here 3 years
 - My honest answer is no, it's been easy to find, but I've been very privileged as a child, young adult, and adult. Prices have certainly shot up since we bought our first home in 2011.
 - Values up 8.9% year over year, tough buyer market
 - Safety and noise! We need safe neighborhoods so hire more officers and chase out the drugs, littering, and noise pollution. Illegal bass and loud tailpipes are ruining otherwise great GB housing options.
 - With new apartment housing being built in Green Bay and surrounding charging \$1,000 for a 1 bedroom, how is this affordable housing?
 - I'm a transplant,
- and it was extremely hard to find nice, affordable housing. Because I was out of state, landlords didn't trust me, they weren't pet friendly, and most were higher priced than what was offered. There wasn't a housing site like other communities, except craigslist but here that site is very sketchy.
- "Unable to find anything affordable--\$1000 or above even over \$600 uses up, many times. all your social security!!
 - "
 - Easier to find, but still not ideal.
 - Home prices have increased substantially in the past 5 years.
 - I know we are short affordable units
 - Not enough 3 bedroom apartment homes, in larger communities, that are pet friendly .
 - Not enough fully intact historical homes "1900s-1920s Craftsman four squares" For under \$80,000
 - There are more market-rate units, but the market-rate seems out of reach for most people I know. I am a young professional with student loan debt,
- similar to many friends.
- Not enough rentals available under \$800.
 - Not many options for low income. Middle/ income condos lack character.
 - Affordable housing is difficult to find
 - City of Green Bay rentals are incredibly not pet friendly.
 - A veces se vuelve más difícil porque los vendedores de bienes raíces quieren vender en el área que ellos quieren que uno compre y solo le muestran esas casas a uno y no me parece que eso sea buena idea
 - Por el problema del idioma
- 41. In your opinion, what effect do each of the following issues have on decisions to choose housing in Green Bay?**
- Some places within the city are priced based on location but also do not cover any utilities at all
 - Rent is too high it was too hard to find a place now days especially if you have an eviction which I get why but at the same time if we have one we shouldn't have to be homeless bc of it. Everyone makes
- mistakes things happen!
- This question is poorly structured.
 - I don't really understand how this question is worded. Are you asking if Green Bay provides a positive or negative experience in these areas or if buyers/renters are looking for these things?
 - Depends on the neighborhood
 - No mold in housing
 - Stop people from moving here, too many from Milwaukee and Chicago and Hindu wherever
 - I haven't looked much, but property tax is way too high here.
 - I'm not considered low income...but am in today's standards. So what I can afford compared to neighborhood characteristics I'd say...there is no neighborhood in my opinion affordable and safe in the 675.00 price range that has good character
 - This question is poorly worded. Ex: By selecting "negative" for school district, I am not saying that the school district has a "negative effect" on my decision to choose my housing.
 - There are some

- very nice character homes in loser neighborhoods, but there is a lot of crime in those areas.....
- Want to buy in Green Bay, but right now, housing is too expensive.
 - Rent is too high in most areas & DO NOT take pets, and the cheaper places are in the dangerous areas! At my age, I don't want to be living under lock & key 24/7
 - This question is confusing. The wording is not very clear.
 - Grocery stores in Green Bay tend to be on the outskirts of the city. The inner city has a high need for good grocery stores with a lot of selection.
 - Nothing in my price range other than crap, to be honest
 - Not sure I understand how to answer the question
 - There's not enough affordable housing that landlords keep up better. I know everything is complaint driven from serving on a town board myself and it's hard to target everyone but when housing is involved some of these landlords should be held more accountable
 - I think people want all of these things when choosing where to live.
 - I like being able to live near downtown Green Bay.
 - There really isn't enough affordable housing, either ownership or rental, especially for the poor or low income members of our community.
 - The city of Green Bay has more affordable housing but lots of pitfalls compared to schools, quality houses and quality neighborhoods
 - Not enough affordable options for senior only living
 - Green Bay has more and more variety in housing than the surrounding communities. The school district lags behind due to challenges that don't exist in the surrounding communities
 - I don't understand what you want me to say in this question, I think people don't move to GB due to unaffordable housing in the city. Families with special needs also pick De Pere due to Sybal Hopp.
 - Affordable housing seems to be hard to come by for low income based on what I have heard.
 - Apartments that match our criteria and fit our needs, are practically non-existent in Green Bay.
 - Transportation options limit where people choose housing
 - There are a lot of new places popping up all over the city, they are all very nice looking but cost is just too much for what I want to spend.
 - Allowance of Pets have had 2 dogs for several years
 - Do not understand the question.
 - Although for each thing indicated as positive, I also feel these are lacking in our community
 - This is a difficult question to understand.
 - Please change the wording on these questions listed above
 - These are the issues my children and grandchildren used to select housing in Green Bay
 - Outrageous costs and Green Bay has no concerns about the low income and safety of neighborhood
 - Poorly constructed question. Confusing pos/neg.
 - I don't understand the question in regards to the issues and the rating scale provided seems it should be important to not important? I rated as such
 - Shortage of middle income and low income condos.
 - While Navarino district has improved, it remains unsafe from time to time, causing us to consider moving.
 - Green Bay has good and bad residential areas, The slum lord type areas need to be brought back to their former good standing and quality, good housing for low income families made affordable in these areas.
 - Downtown Green Bay and areas closer to the center of the city are not as well taken care of, as well as a higher rate of crime and traffic issues. As you travel outward, prices rise and quality increases.
 - SIDEWALKS! Hard to find Green Bay neighborhoods with them and would REALLY like them. In addition, continuous bike lanes. I don't live far from work, but the active commuting route is disjointed making it difficult to bike to work.

- Since quality of school is often tied to property taxes those areas with more wealthy home owners tend to have better schools so families of lesser means are more likely to be unable to purchase a home in an area that also had better schools
- Downtown GB Schools are rough.
- Thanks to Neighborworks for making this home possible
- A decent area is always preferable.
- I am not sure I know what you were asking in this question.
- I'm not sure I understood question -- factors which would influence choice or factors available in GB?
- The academic quality isn't great but we like the diversity of the district
- I suffer from severe depression, anxiety, PTSD And MST. I need to feel and see I can protect my children
- Stores that are close
- recently the market has been lopsided in favor of sellers
- Safety/Neighbors
- My answers refer to Ashwaubenon
- I don't understand the rating system with the question
- A lot of crime ridden areas in Green Bay!
- Those in my price range usually need a lot of repair
- There are many slum lords in Green Bay. They should be held accountable to keep up their properties.
- Again, the city is becoming gentrified with little diversity happening in the newly developed areas.
- Old perceptions of downtown neighborhoods need to be changed
- There appear to be a few nice neighborhoods - cool character and where there is evidence of investment and care. Infrastructure investment appears poor and that is scary as a private investor. I can't afford to be the most expensive house on the block and to send my kid to a private school because the reality of living in the center isn't easy. It's too easy and cheap to living somewhere else and drive to work. The city is too spread out and low density to require choosing the center. The only reason seems to be to lessen the impact of greenfield development but as mentioned prior, all the other uncertainties negate that desire.
- Green Bay is a diverse community with a lot to offer! Housing options vary depending on the area. Some neighborhoods are desirable, some are not. I wish there was more affordable housing available for the working poor. Challenges with transportation and access to childcare and other needed amenities.
- Green Bays neighborhoods and schools have been in decline over the years. Crime and drug activity has consumed the eastside. People that can afford to will move to better, safer neighborhoods in Howard, Suamico, Ledgeview.... anywhere but Green Bay.
- Reasons are too individual to generalize.
- The neighborhood where I'm at is awful and getting worse
- This question was very strangely. I interpreted positive meaning "very important."
- Above issues are irrelevant given the poor quality of life in this city.
- Word your question better
- My family lives on west side, north of Lambeau Field so that's why I chose to live here.
- Your scale makes no sense...
- I have friends who looked a long time to rent and are over-paying because they have cats
- I think potential new residents perceive village schools as better than GBAPS
- Hard crime on the rise and pedophiles in my neighborhood
- Too many drug houses and sex offenders living in wrong areas
- The apartments/duplexes that i qualify for, are old, run down places like dutchmans creek (creekwood) where the really bad folks from Milwaukee/chicago take over because management of said places tend not to care so much as long as the places are rented.
- These questions are worded poorly.
- We need 3 bedroom, 2 bath, first floor, pet friendly, lower crime rate
- Need more retail especially in the center area of city More credit unions, fast foods, Afford-

- able supermarkets, Restaurants and bakeries
 - We need more commercial neighborhood centers for residential areas
 - .
 - N/A
- 42. In your opinion, what are the greatest unmet housing needs in Green Bay right now? (select up to 3)**
- Property management control, less with apartment buildings and more so with residential houses and duplexes being rented within the city
 - Affordable housing in a safe neighborhood
 - Seems to be a lot of placing and apartment building and condos being built for very high income young people or places being rented out and no one is living in them.
 - You need to help those with evictions find places too not just the older or disabled. Everyone needs help
 - Not helping people who have a criminal past who have a hard time getting back on their feet and struggle to survive because no one will help them due to their history
 - We want to buy a house but our savings was spent the year I was diagnosed with MS. It's difficult to get back to where we were.
 - affordable rentals for low-income individuals - not enough of them
 - So many houses on the east side have had flooding issues, it makes me wary of buying a home in many neighborhoods
 - control of litter partially because of the way that the schools handle their open campus lunch programs is out of control. Also No One issues fines for littering in this city and that must change
 - No mold and renting for big dogs. . German Shepherd friendly
 - Housing for poor/bad credit, or other blemish (evictions, criminal charges) which would have someone face homelessness
 - Affordable living considering the hourly wage I get paid. It's too expensive to pay rent and all other bills associated with renting my own place again.
 - In Sheboygan they turned a hospital into apartments. It was a dump. Drugs. But, something like that, affordable for single men who don't need a big apt. or are looking to save up. big communal kitchen. It was a fun community for the most part. They were month to month so they could kick the riff raff out. \$500 or less. Why can't we get something like that.
 - Affordable rental options
 - there are very few housing options for people with less than satisfactory backgrounds.
 - Wait list for assistance is 2 years. Homeless list is 1 year!
 - Affordable housing for low income landlords not allowing ICS vouchers on property should be a crime. Landlords should have to follow housing codes to avoid slum lords.
 - Housing for ones who are getting over a financial slump
 - Housing for 55 and up. The quality is lacking. We are still active and have grandkids. We still want 2bd. They build them more like nursing homes than functional affordable housing.
 - Affordable rental options for low income families.
 - Taxes too high compared to surrounding area
 - Housing for people with cats.
 - Homes in safe areas.
 - Also, Affordable yet QUALITY/MAINTAINED housing in general.
 - Affordable rental units and landlords willing to work with housing subsidy programs
 - Affordable and safe housing for low income families.
 - Affordable renting options that aren't tiny dark old apartments.
 - We need far better, cleaner, safer and more affordable housing for seniors.
 - Water damage is downplayed and overlooked by realtors, but causes serious health effects. The public needs to be informed and stricter codes need to be put into place!!!
 - Not all seniors live high off the hog! Bring some affordable units to GB where seniors can live without going broke!
 - apartments with 3-4 bedrooms
 - More affordable options
 - Affordable Ranch homes for rent in good newer areas
 - Housing for families

- of 2 to 5 children in a nice area that is affordable
- Far too many 3 bedrooms ranch homes that won't be able to sell in a few years.
- Build homeless shelters in de Pere and suamico
- I work in housing the homeless and I can say that it is very difficult to house the homeless especially if they have a criminal history.
- homes are not affordable at this current market
- the apartment I live in should be condemned but then I would be homeless
- Housing for sex offenders
- Housing for a single person is near impossible for the price
- City of Green Bay and Brown County not invested in their housing community for renters/tenants. City of Green Bay and Brown County relying on use of housing based program to be the "Save All - End All". Those entities not recognizing landlord units do not need housing based programs due to demand for housing. Those entities too need to show buy-in and support
- to landlord units to address housing needs for those without housing.
- Affordable housing for all - a one bedroom apartment shouldn't cost what it does
- Affordable, safe housing options for all low income families/singles
- Having only lived here less than a year and done limited searching prior to moving into my current apartment, I really don't have much of an opinion or knowledge regarding a lot of this stuff.
- Housing with universal design, which is not the same as housing for people with disabilities.
- Rent is too high
- Rent cost
- Affordable apt renting (or house rentals)
- Housing for people who are victims of domestic abuse. Housing options for people with an eviction on their record (how do they secure housing when no one will rent to them?) housing for untraditional and inter generational families;
- All of the above!
- Cost and quality
- Persons released from prison
- Actually, all could be selected IMO.
- affordable houses and duplexes for middle income individuals. So much of the new construction is for low income individuals with income caps. these new builds are nicer than those of us with middle income can afford and start at \$1300 about for a studio or a one bedroom. How about some nice new construction for rent for the middle income folks without outrageous rent prices attached to them.
- Lack of Pet accepted housing
- Delapidated homes should be raised. I was thrilled to see the building on the corner of Baird and Main come down. I'm hoping the underground part will be dealt with too.
- We need more quality, safe low income housing for all the above populations, including veteran housing.
- I would like to see more programs that help people who can afford to buy a house and pay mortgage but then have little left over to maintenance or other related necessities (car/garage repair, landscaping, home repair improvements, getting assistance with home maintenance); it would also help I think if the payments a home owner is automatically expected to make on street repairs, city projects etc could be pro-rated based on that home owners actual income/available money rather than just the value of the property. The value of the property doesn't necessarily reflect the ability of the owner to keep adding debts and payments they don't personally choose but which are automatically assessed to them because they own that property.
- High end single family homes
- Affordable housing for people with disabilities.
- Older houses in Green Bay need work
- Affordable rentals
- Duplex upkeep,. Always run down dragging the down neighborhood with it.
- Housing for individuals between the ages of 50-70 interested in downsizing but still very active!
- Quality of schools in the neighborhoods

- | | | | |
|--|---|--|--|
| that are affordable | parking for 2 or more vehicles, many apartments only have 1 spot and if you are a couple or have roommates that does not work | fice and was told it's common and they can't stop it! | young professionals who are interested in home ownership and do not want to live in a condo or apartment. |
| • Good housing | | • Rentals/housing for people with pets or questionable credit. | • New construction of apartments are really expensive. More than my house payment was. |
| • My answers apply to Ashwaubenon | • Safety | • Condominiums or similar ownership options for people who do not want the traditional detached house lifestyle | • Lack of decent apartments in all areas |
| • "The deterioration and unsafeness of our once beautiful inner city...east, west and north sides. At 72 i am a lifelong resident and could cry. | • The fact that there's no room to live and we can't build on our own properties even though it would help our community both mentally and financially. | • Too many drug houses and sex offenders living in wrong areas | • You need apartment homes for those who are downsizing from houses later in life. |
| • "There is enough housibg | • I work in Sofia Services so I feel I have 1st hand knowledge of Section 8 and low income housing being n/a | • Artist residency and air bnbs | • Housing for people with pets |
| • Affordable rent | • Housing for people with records | • When a single mom has 2 children .. 1 boy and 1 girl and needs a 3 bedroom place, she is stuck in a run down 2 bedroom place unable to afford better | • Landlords refusing to take assisted applicants forcing more than one family/unsafe living arrangements. |
| • Affordable houses for seniors. | • Major issue with senior/disabled living is Monroe Plaza! My daughter, who was 8 months pregnant was followed into elevator and offered crack! Another day we witnessed young girls prostituting to male residents. We also saw drug materials in common room on fourth floor twice! Young males sleeping in common room most nights. Very dangerous building. Mom moved out because she was so scared after having visitor steal her cart with groceries right from her in hallway! Reported all to of- | • Affordable rental units | • Pet friendly |
| • Affordable rental options for young families | | • Young professional housing affordability | • Más casas con un pago accesible con opción a compra. |
| • Availability of single family homes | | • Young professional housing - mid priced, close to amenities, good neighborhood, room for a small family | • N/A |
| • Affordable housing. Everything I've heard of being built is out of our price range, and I work for the city. We need better housing for the low income downtown | | • Housing options for young people, working professionals, couples without children. New home construction seems focused on large houses (high sq. footage, three garages, etc.) at prices well above \$250,000. Smaller, "starter homes" would be ideal for | |
| • "We need availability of shop keepers to live above their businesses again, that was one of the greatest things about old Green Bay. We also need more access to community gardens, perhaps even a victory garden type program to help people grow nutrient dense food in their yards. | | | 43. If the City were to use/create programs that target a specific housing type, is there a specific type of investment you feel would have the greatest benefit? |
| • "Inventory | | | • Construction of new rental housing, but affordable, not 1k and up for 1 and 2 bedrooms |
| • Housing that has | | | • Invest in tracking down and getting rid of landlords who don't take care of property's |
| | | | • Housing assistance |

- of any sorts is not accepted by anyone in decent looking places which is silly bc they are guaranteed payment yet have a set of standards to maintain
- I want to choose Construction of new rental housing but add the fact that new construction needs to be affordable. A lot of new builds, such as the new complex on Main Street near Whitney Park, or rehabilitations, such as the Whitney School Apartments, are far out of the price range of many Green Bay residents.
- No need to build and destroy more trees. Fix up existing buildings, but do it well. Also use abandoned buildings to fight homelessness.
- incentivize landlords to keep rents affordable
- Rehab of rentals/ large family units with no increase in rent
- Affordable rentals aren't \$1600 for two bedrooms. Average single income families can't afford that and they don't take assistance.
- Construction of new homeless shelter
- Buy up properties prone to flooding! You shouldn't be building new housing when existing housing is flooding so much
- We need to have more restrictions are landlords to rent to crappy tenant similar to the way they have laws in Milwaukee that hold landlord responsible for things that tenants do or the city will never improve
- Affordable housing
- Not sure
- Rentals for current or near risk of homelessness
- Make it more affordable for people to live in what we already have most people are homeless or on the line of it bec it's too expensive
- Answered in previous
- We definitely need more options for people and families who are experiencing homelessness
- Assistance to help low income buy foreclosed houses and rehab them
- Rental costs seem high considering property values, but I think a lot of that is the property tax rate. I sold my house in Reno for \$260k, my property tax was less than \$1,000 per year.
- Low income housing
- I wanted to click both rehab housing and new construction affordable housing
- Affordable for the working poor
- Affordable Senior Housing
- Seniors...there is such a waiting list for affordable housing. I can't afford to retire...lose half my income and at least 2yr waiting list after that....and wouldn't be able to afford when I'm at while waiting... with health issues dread not being able to afford to stay if I couldn't work any more yet no affordable housing available without a long wait.
- Affordable rental housing
- Construction of new rental housing SPECIFICALLY for low-income and Section 8 individuals.
- But at affordable prices! Who can afford 800.00-900.00 a month? Most places I've seen are not made of gold! The last place I live was just NICE... and when I moved.. the jacked the rent to 975.00 a month! OMG!! The maintenance was awful there!
- The few low rent buildings that I have been in are not conducive to healthy family living.
- Affordable housing with resources on hand to provide budgeting, parenting and nutrition classes/resources.
- many buildings sitting empty that can be re-purposed. PLEASE do not build new, let's put empty buildings that are unable to be rented to use.
- Families that I work with as a teacher at Howe are often moving and will often share the struggle with finding a new apartment within a reasonable distance to Howe. This is a reason students in the gbaps district often switch schools many times in just their elementary career. Parents share they want to live near the elementary school their child has gone too but it takes too long to find that as an option.
- Construct new, more affordable housing for seniors.
- Investment is worthwhile if it addresses the needs of those who need decent, affordable housing.
- For seniors but on a small independent scale. A community group or setting of

- smaller homes/cottages for seniors to rent/buy.
- Forcing new and existing landlords to take housing so more of those who are coming out of homelessness can get into a place.
- Affordable Housing
- See above
- In some areas houses should be demolished and new housing of mixed housing built. In other areas of the city remodeling existing homes and fixing up a neighborhood is good
- The city needs to limit government assistance or have stricter guidelines. Limit assistance to residents of the county/Green Bay, people who have lived in and contribute to the community.
- Single floor condos, reasonably priced
- Only private sector money should be used.
- Rental apartments specifically designed for senior citizen communities with services and amenities.
- I am looking for housing not investments
- affordable, accessible housing is a must that is in good repair and location
- Establish/Try pilot programs to grab the attention of landlord units: Tax Break Incentive, Repair Incentive (failed Housing Inspections), Rental Income from Housing Program Not Taxable (as income, probably above what City could do); as examples. Beyond... Improve housing inspection response from Integrated Community Solutions,
- Rentals for low income people!
- New rental housing, but with a focus on ACTUAL affordable housing and market-rate housing, luxury units are swamping the market and unrealistic for most young families and singles, persons living with disabling conditions, and seniors
- Rentals that take rental assistance that are up to code.
- All of the above should incorporate universal design principles.
- Would like to choose rehab of BOTH owner occupied and rental housing.
- We need affordable rental units. The new builds downtown aren't affordable to most people.
- "Rent-to-own option apartment/condo option for single people.
- And rehabilitation of lower priced rentals. All new apartment construction is luxury and \$\$"
- Scatter site variety of housing options for lower income households
- Affordable options for each type listed above.
- We need more elderly/disabled rental housing community buildings for the low income in this population, but also quality, safe low income housing for the general population.
- TEAR DOWN THE SAD DISCUSTING AREAS = STAY OUT OF THE WAY AND GET BUILDERS NON=PROFITS ETC TO SO THERE THING HOME-OWNERSHIP NOT RENTALS
- Affordable new retail housing, not that expensive crap being build downtown.
- I feel there are 2 needs to be addressed: rehabilitation of owner-occupied housing and rehabilitation of rental housing back to single family occupied housing.
- No more new rentals. Far to many apt buildings in my opinion, although they all appear to be full?
- Unsure
- Land trusts in which eligible owners can purchase constructed housing for a lower cost, receive the increased value for their home improvements when they sell, but the land and its potential increase in value remains in trust.
- Not sure
- Not sure
- Fix up all old houses
- low-income condos
- Rent to own housing options? Income based buying options. I work for a non-profit ... I love my job but shouldn't have to work 2 jobs. The individuals I serve deserve quality people who are willing to sacrifice a higher income to serve them.
- The northeast and northwest neighborhoods appear to be in need of rehabilitation, both rental and owner-occupied.
- Construction of AFFORDABLE new construction and rental properties. Green Bay has become unaffordable to the people it wants to retain/

6. GBMFD Cardiac Monitor Final Report

“BETTER BY THE BAY”

Metro Fire Department
EMS, Training & Support Services

Ryan Gibbons
Assistant Chief

Date: 11/12/2020

To: Green Bay Finance Committee

From: Assistant Chief Ryan Gibbons

Subject: Cardiac Monitor Purchase

The current Cardiac Monitor devices of the Green Bay Metro Fire Department have reached their end of service life. A request was made and approved with the 2020 bonding to move forward with purchase of these new devices.

After a search of current cardiac monitors available on the market today it was determined that only one monitor would meet the needs of the Green Bay Metro Fire Department. The results of the selection committee evaluations and process is attached with the packet, along with the sole source request.

Request to approve purchase of the cardiac devices from Stryker

Stryker

14 - LifePak 15 Cardiac monitors with corresponding accessories -	\$354,892.50
41 - Stryker LP1000 Basic AED -	\$74,700.00

Technimount System

14 Mounting brackets, Technimount System -	<u>\$12,235.00</u>
--	--------------------

Total Purchase price - \$441,827.50

City of Green Bay, Wisconsin
REQUEST FOR APPROVAL OF "NO SUBSTITUTE" PURCHASE SPECIFICATION

TO : Purchasing Division/Administrative Services

DATE: 11/12/20

FROM: Department/Division Fire

REQUISITION #

List "No Substitute" Item(s) here:

Stryker - Lifepak 15 cardiac defibrillator monitors, AED's, and accessories.

Select One:

- ☒ 1) One Time Purchase Estimated Cost: \$ \$441,828
- ☐ 2) Annual Commodity purchase: Estimated annual cost: \$
- ☐ 3) Item may be purchased again: Indicate term: Estimated Annual Cost: \$
- Example: 1 year, indefinite, etc. Long term requests will be reevaluated periodically)

We request approval of a "NO SUBSTITUTE" specification for the purchase of the subject item(s)**Check appropriate justification(s). Provide DETAILED explanation(s) below.**

- ☒ 1. Sole Source – The below signed has searched the market and verified that no comparable item is available.
- ☐ 2. Single Source – Although comparable items are available, THIS is the only brand/model that will work.
- ☐ 3. Item(s) is (are) only acceptable replacement part(s) known for _____ (Identify)
- ☐ 4. Continuity of design is overriding consideration (ex: playground equipment or street furniture)
- ☐ 5. Safety:
- ☐ 6. Other:

*Explanations shall contain sufficient information and justification for the items to be considered and approved as "NO SUBSTITUTE" items. Failure to do so will result in the request being denied and returned to the originator.

*Recommending Department Head will be available to defend said recommendation to the appropriate City Committee and/or Common Council.

PLEASE EXPLAIN YOUR REASONS FOR THIS REQUEST (additional info may be attached on a separate sheet):

The fire department is requesting the purchase of 14 Stryker/Lifepak 15 cardiac monitors. This purchase will replace current model cardiac monitors that are at end of life status. The 3 cardiac monitor manufacturers were evaluated. Two manufactures had a critical failure leaving the Stryker/Lifepak as the only device that will safely meet the needs of the Fire Department Emergency Medical team. Cardiac monitor evaluation report attached. Request to proceed with purchase of 14 Cardiac Monitors and 41 compatible AED's Stryker model LP1000.

Introduction

The Green Bay Metro Fire Department (GBMFD) formed a committee to evaluate Cardiac Monitor/Defibrillators. The Food and Drug Administration (FDA) has recently approved certain Cardiac Monitors with Automatic External Defibrillation (AED) capabilities. Current GBMFD Cardiac Monitors are at end of life and will have non-approval status from the FDA at the end of 2021. The intent of the evaluation was to find a suitable replacement for GBMFD's aging Cardiac Monitors.

A committee of GBMFD paramedics was established to evaluate the different potential cardiac monitors. The evaluation group was established in conjunction with the Green Bay Professional Fire Fighters Local 141(Local 141).

The three different cardiac monitor manufacturers were invited to present their products to the committee for 1 hour and 45 minutes. Each manufacturer needed to present a FDA compliant cardiac monitor defibrillator that has been approved and passed through a premarket submission in accordance with 21CFR807.87. They were then instructed to leave a working demo model for the committee to field trial in simulated scenarios at a later date.

Manufacturers invited to participate in the GBMFD process included:

Philips North America Corporation
Stryker
Zoll

Evaluation Committee Members

Captain Mark Polomis
Captain Joe Thompson
Captain Jordan Waack
Lieutenant Dan Chatham
Engineer Keith Zaidel
Engineer Chad Decker
Engineer Curtis DeQuaine
Firefighter Dan Alderfer
Dr. Kyle McCarty (Medical Director)

Evaluation Process

An initial committee meeting was held on August 5, 2020 with all committee members.

Presentations were made to the Cardiac Monitor committee on the following dates:

Phillips – August 10, 2020

Zoll – August 10, 2020

Stryker – August 11, 2020

The practical evaluation phase of the evaluation process took place on 8/13/2020 and 9/10/2020. Field simulation scenarios were used with each monitor. The same ambulance and route was used for each monitor to evaluate a consistent cardiac monitor tracing for each device. These simulations allowed the monitors to be used in as close to real life like situations as possible.

The field trial consisted of live lime usage in Med492 while traveling in a pre-determined three mile route. The route consisted of known streets with less than ideal, and new road, and new road conditions. Each monitor was placed on a live person while other committee members used the different monitoring features. This allowed the monitor to be tested for tracing integrity while the ambulance was in motion. This opportunity also allowed members to move about the features and menus that would be used during patient care. Entering of different data points used during patient care was also evaluated. Classroom time was also used to evaluate all of the different features of the different units.

The committee convened together on September 18, 2020 to discuss field trials, features, and capabilities of each monitor. Committee members then completed scoring for each monitor.

Cardiac Monitor Scores			
	Zoll	Tempus (Phillips)	Lifepack
Total Points Available	23	23	23
Total Points Awarded	106	117	154
Average Score	15.1	16.7	22.0

- COMPANIES IN RED had critical failures during field evaluations

Field Trial Summary Results

Both Zoll and Phillips had a critical failure. During the field trial using external cardiac pacing the device was able to be turned off with a single button push. If the device was inadvertently turned off during this critical cardiac therapy, the potential exists that it would not be able to be restarted thus having fatal consequences to the patient.

The Stryker monitor did not have this critical failure.

Zoll

Pros

- Potential for future expansion
- Easy to transmit information
- Clone monitor settings
- CPR Feedback built into defibrillation pads
- WiFi enabled

Cons

- Ability to shut off during pacing therapy
- Capnography(etCO2) needs to be turned on
- Does not integrate with current records management system
- Difficult data entry
- Menus buried in multiple menus
- Annual calibration fee

Phillips

Pros

- Light weight
- No battery calibration
- Camera
- Zip drive Clone
- CPR sensor with report
- AT&T compatible

Cons

- Ability to shut off during pacing therapy

- No AED mode
- Monitor and defibrillator are separate devices
- Printer Location
- Expense of video laryngoscope

Stryker

Pros

- No recondition of batteries
- Only monitor with 360J defibrillation
- AED feature
- CPR report summary
- Ease of data input
- Compatible with current records management system
- Durability
- Can program to local protocols
- Front facing printer
- Monitor to Monitor clone
- One button functionality

Cons

- Weight
- Older design
- No ultrasound or video laryngoscope
- No CPR pads

Warranty Comparison

Zoll – 1 year warranty batteries and monitor

Philips – 1 year onsite warranty or 2 year bench warranty, 18 month battery

Stryker - 1 year warranty batteries and monitor

Service/Vendor Support

Zoll – Annual preventative maintenance

Philips – JOE INFO

Stryker - No in house maintenance

Recommendation

The evaluation process has determined that the Stryker Life Pak 15 would best meet the needs of the Green Bay Metro Fire Department. The critical failure of the other vendors would not satisfy the needs of GBMFD. It is the recommendation of the committee to move Stryker in forward into the procurement process.

Assistant Chief Ryan Gibbons
GBMFD

Report to the
Finance Committee

Report to the
Joint Finance/Personnel Committee
of the City of Green Bay

MEETING DATE

December 1, 2020

PREPARED BY

AGENDA ITEM # Q.4

To refer to staff a request by Ald. Wery to the Finance committee which states: "Due to ongoing reasons of 'inadequate staffing' and 'prioritizing of tasks' in our Law Dept, I am requesting we hire City Ethics Inc, or a similar qualified party, to draft revisions to the city's Code of Ethics and Code of Conduct as recommended in their 2018 findings paid for by the City of Green Bay" with request that they return to the next Finance Committee meeting with an approximate window of how long it will take to complete the project internally in addition to providing recommended actions should we need to outsource the service. Motion carried.

REVIEW OF ETHICS CODE AND CODE OF CONDUCT—GREEN BAY

In order to conduct this review, I analyzed the Wisconsin Ethics Code, the local Green Bay Code of Conduct and the Green Bay Ethics Code and spoke with City Attorney Vanessa Chavez and Alderman Chris Wery.

My recommendations are based upon my 35 years of experience in the ethics and anti-corruption field, including being a federal prosecutor, Fellow at the Harvard Ethics Center, Ethics Director of Jacksonville, Florida, Founder of [CityEthics](#) and ethics consultant with cities across the United States, the Middle East, Europe and China.

It is most important to know the difference between the 3 basic types of governing documents for Council members:

1. **Codes of Conduct.** These codes focus on general values, such as fairness, respect, honesty, transparency. They are aspirational in nature and cover what a person “should do”. This type of code cannot successfully be enforced with legal processes, such as complaints, hearings and fines. (See the [Ethics and Value Code](#) of Santa Clara, CA for a good example of this type of code.)

2. **Legal Ethics Codes.** These codes contain specific “do’s and don’ts”; a minimum standard of behavior. The laws flow from the general ethical concepts that you see in the broader Codes of Conduct. For example, the general value of not using one’s office for personal gain can be translated into a legal requirement that officials not accept gifts from those doing business with the City.

A legal code contains clear advance warning of what constitutes a violation; it is not subjective and up for interpretation. Legal Ethics Codes can be enforced and violations penalized with letters of reprimand or fines. Most legal ethics codes cover potential conflicts of interest and they can also cover campaign activities. CityEthics has developed a model ethics code which I have attached for reference as to the types of provisions that should be considered for a Code of Ethics.

It is possible to start a legal Code with a “preamble” or “declaration of policy” that lays out the values and purpose behind the actual laws. But, it should be clear that these general provisions are background, and not enforceable by a legal process.

3. **Council Internal Operating Rules.** These are rules that lay out the process for Council meetings: leadership positions, committees, how to take public comment, how to conduct orderly meetings and what to do about disruptions to meetings. For an example, see [Seattle, WA Council Rules](#). The Council always has the option with Robert’s Rules of Order to censure members of the body for their conduct during the meeting. This is an expression of disapproval of a member’s acts. It is best to have a procedure for censure

in place that ensures due process. I have enclosed a sample of one that I developed for the Council of the District of Columbia. (Note: when you have a procedure for censure, you have to discuss what types of actions can be the subject of a censure. Can it be any bad behavior or only bad behavior in City meetings and interactions? I believe it is best practice to only censure bad acts related to City related business.)

Now that we have reviewed the three types of governing documents, I will comment on your current Code of Conduct and your current Ethics Code.

CODE OF CONDUCT. Green Bay

This is an interesting document because it combines all 3 types of documents into one and then sets up a legal process to enforce it. It is not possible to enforce these types of value driven concepts: “take the high road”, “members shall not be degrading” (what does that mean?), “making belligerent comments”, or “having clear and honest communication”. These are all good things to aspire to but everyone will interpret violations differently. It is arbitrary to try to enforce these values in a legalistic fashion.

Here are the “values” type provisions in this Conduct Code: Section 2, being civil and having decorum; not using abusive language; Section 3, treating all staff as professionals; never demeaning employees; Section 4, making the public feel welcome, no signs of partiality; demonstrating honesty and being welcoming; Section 6B, being sensitive as to how they are viewed at Board meetings; 6C being respectful of diverse opinions. These are all good goals to discuss and to try to live up to. If a person habitually violates the values of the community as an elected official, the penalty is that it is likely the person will not get re-elected. Punishment with fines or community service and formal evidentiary hearings are inappropriate for violations of aspirational value goals.

Most of the Conduct Code covers items that should be moved to be in the Council’s Internal Operating Rules. This would cover how to maintain order at Council meetings and how to treat citizens at meetings. For example, 1. B. point of order during meetings if inappropriate statement made; Section 4 (how to welcome speakers; fairness in allocating speaking time to public; don’t argue with public; follow parliamentary procedure); and Section 7, Contact with media.

There are also sections of the Conduct Code that need to be in the Code of Ethics as laws; these are more in the nature of “do’s and don’ts” that can be enforced. For example, Section 3D—soliciting political support from City Staff; and sections 5A and 6A need to be turned into specific conflicts violations. See CityEthics Model Code provisions 1, 3, 5 and 6.

Also, there could be an ethics law developed to cover the issues in Section 3.C. on superseding administrative authority. This law would lay out specific parameters on how officials can interact with City employees and the Department Heads. It is important to lay out laws like “Cone of Silence” during procurement or contract negotiations to prevent improper influence of elected

officials on the process. Section 3.C, improper influence in purchasing and contracts is a key area and should be elaborated on and included in your legal Code of Ethics and made enforceable.

Recommendations:

Remove Section 8 of the Code of Conduct, "Enforcement". Values cannot be enforced with complaints and legal proceedings; it is too arbitrary and will be contested by anyone accused of vague violations, for example "my statement wasn't impertinent", or "my communication was honest and clear". Review the Conduct Code for potential additional sections on values (see Santa Clara Code.)

Pull out all sections from the Conduct Code that regulate the specifics of how meetings are run and how the public are engaged and add them to your Council Internal Operating Procedures. (If you don't have a set of those, they should also be enacted.) Discuss and enact a censure policy for your Council.

Pull out provisions that should be in the Legal Code of Ethics and make them specific so they can be enforced, for example: campaign activities, conflicts in front of Boards, withdrawal if conflicted. Confer with your City Attorney to make sure that the Wisconsin law on local ethics codes does not already govern this behavior; see section 19.59, state law.

ETHICS CODE. (Section 1.90) Green Bay

There are many improvements you could implement in your Ethics Code. Here are some ideas:

1. Section 8, Ethics Board.

All members should not be appointed by the Mayor. This does not encourage independence. Either assign the appointments to other officials or have community organizations provide a pool of qualified applicants for the officials to select from.

The City Attorney should provide all services to the Board, unless there is a documented conflict and then outside counsel would be retained (in many jurisdictions, attorneys volunteer to do this); if outside counsel is retained, then that person would only provide legal services in the areas that involve the conflict, not in other routine matters in the case. There should be budget limitations that are enforced.

The Ethics Commission should be required to enact comprehensive Rules of Procedure to ensure due process in hearings; it is not enough just to say they shall conduct a "due process hearing". Here is an example: *"The Commission shall establish and post rules and procedures to provide for due process in the charging and prosecution of violations of this Code."*

I have enclosed a set of such due process rules that can be reviewed by your Commission. It is useful to have a provision in your Ethics Code allowing the Ethics Commission to dismiss charges when appropriate:

*The Commission may, at its discretion: (a) dismiss any complaint at any stage of disposition should it determine that the **public interest would not be served by proceeding further**, or (b) dismiss any complaint at any stage of disposition and issue a letter of instruction to the respondent when it appears that the alleged violation was inadvertent, unintentional or insubstantial. In the event the Commission dismisses a complaint as provided in this subsection, the Commission shall issue a public report stating with particularity its reasons for the dismissal.*

So for example, if a person leaves office, is it reasonable to use taxpayer funds to pursue a case? The Ethics Commission could consider this type of situation and say “no”—it’s not worth it, and dismiss the case in the public interest.

Ethics proceedings should be confidential until a probable cause determination on the validity of the accusations is made; the process can become a circus if opened up immediately.

2. Section 4, Fair and equal treatment needs to be re-written into a misuse of property and position code provision. The existing language is a combination of a value statement and an actual prohibition. See section 11, Model Code.
3. See section above on the Code of Conduct; you need specific laws governing political activities, voting conflicts, withdrawal from certain matters and rules on officials representing other interests in City proceedings: Model Code sections 1,3, 5 and 6.
4. Penalties; it is fairly severe to remove someone from office; is that allowable under state law? What about fines up to \$1000?
5. Section 5(c). Incompatible employment. In order to prevent this type of conflict, it is advisable to have a requirement that all officials and employees file a disclosure of any secondary employment they might have so it can be reviewed for any prohibited conflicts. (I can send forms and procedures on this if you are interested.)
6. There should be an “Ethics Officer” designated for the City. This person is in charge of creating a preventative training program and in working with the Ethics Commission. It can be a collateral, part time duty of a current employee.
7. Periodic ethics training should be required of all employees and officials, especially when beginning a new role. This should be a requirement in the Code and cover training on your local laws, state ethics laws (with examples) and values based concepts.
8. Your gift provision (5.c 3) is weak. Left up to “reasonable, prudent people”, someone could consider a \$500 gift OK or say the gift doesn’t influence me. There are lots of options here for disclosure and/or reasonable limits being set.
9. Section 5e needs to be developed more. When is a disclosure made? It should be prior to any discussion on the matter. See section 101 of the City Ethics Model Code for discussion on this topic.
10. You may want to consider a procedure for a confidential hotline for the Ethics Commission and a basic whistleblower protection clause.

Model Municipal Code of Ethics

Declaration of Policy, Purpose, and Obligations

To discuss declarations of policy, click [here](#).

The proper operation of our city's government requires that its public officials and employees act as fiduciaries entrusted with and responsible for the property and resources of the community; that they make governmental decisions and policies in the proper channels of the government structure, free of coercive or other improper influence; that they use their position in the best interests of the city rather than for personal interests, whether their own interests or those of their family, friends, or

business associates; and that they do not, directly or indirectly, in a positive or negative sense, treat anyone preferentially, that is, other than in a manner generally accorded to city residents.

It is central to gaining and retaining the public's trust in our city's government that public servants seek to avoid even the appearance of impropriety. Fulfilling one's role as public servant sometimes means sacrificing rather than gaining opportunities.

This code focuses on conflicts of interest, which affect the decisions of government officials and employees in ways that are unfair both to the community and to individuals and entities who lack special relationships with our city's officials. When public servants make decisions that are not or do not appear to be impartial, this seriously undermines public confidence in government.

While the vast majority of municipal officials are well-meaning, being well-meaning is not enough. It is important that officials understand the conflicts they confront every day, appreciate their fiduciary obligations to city residents, and recognize the importance of preventing conflicts from occurring, disclosing conflicts when they arise, and withdrawing from any involvement in a matter where they have a conflict.

Nothing is more important to public trust than having public servants err on the side of disclosing every possible conflict and withdrawing from participation even where they feel certain they can act impartially.

The purposes of this ethics code are:

- (a) To establish standards of ethical conduct - especially those dealing with conflicts between personal interests and those of the city - for city officials, employees, consultants, candidates, and those who do business with the city;
- (b) To provide clear guidance with respect to such standards by clarifying which acts are allowed and which are not;
- (c) To promote public confidence in the integrity of our city's governance and administration;
- (d) To provide for the consideration of potential ethical problems before they arise, to minimize unwarranted suspicion and to enhance the accountability of our city's government to city residents; and
- (e) To provide for the fair and effective administration and enforcement of this code.

There is more to ethical conduct than what is covered by this code, which consists primarily of enforceable rules about conflicts of interest, and procedures for enforcing the rules and providing ethics advice. The city must also provide a healthy ethics environment with positive means of encouraging ethical behavior among its public servants. And individuals - especially community leaders - must commit themselves to dealing responsibly with their conflict situations.

Ethical conduct depends on thinking about one's acts not in terms of what is politically popular, best for oneself and one's colleagues, or even most effective and efficient, but in terms of what is in the best interests of the city. Ethics is not just about enforceable rules, but also about democratic ideals and aspirational goals. Central to ethical action is respect for city residents (treating them as ends rather than as means) as well as self-respect (integrity, expecting the best of oneself).

This code is enacted pursuant to [Section ____] of [state statutes] and is not intended to authorize any conduct prohibited by that section.

Comment: *It is helpful to list other municipal and state ethics-related laws here, or reference a supplement containing them, so that all ethics laws are available in one place. In this way, people will not have to search for them or worry if they have missed any rules or exceptions. It is also helpful for authors of ethics laws to consult all other relevant laws, so that there will not be any contradictions.*

Here are the citations in the Connecticut model code I wrote, including only references to state law: "The power to adopt an ethics code is provided in 7-148(c)(10)(b). There are some specific conflict of interest rules in 7-148t. Allegations, confidentiality, and probable cause findings are provided for in 1-82a. A business with which an official or employee is associated is defined in 1-79(b). And the Freedom of Information Act can be found in Chapter 14, 1-200 to 1-242."

Why freedom of information? Because it involves one of the most often abused conflicts of interest: between the public's right to know and the municipal official's desire to keep information hidden, for personal or political reasons (it's much easier to do one's job in secret than in the public eye; it is especially easier to act unethically when acting in secret). In fact, it would be completely appropriate for a municipal ethics code to supplement the Freedom of Information Act in areas that have been problems in a particular city. For example, an ethics code could include longer notice requirements for meetings and agendas, shorter periods in which to provide information (as well as lower reproduction costs), and requirements for notice and the placement of information on the city website.

Part A: Ethics Provisions

100. General Conflict of Interest Provisions.

1. Conflict of Interest.

To discuss this provision, click [here](#).

a. An **official or employee*** may not use his or her official position or office, or take or fail to take any action, or influence others to take or fail to take any action, in a manner which he or she knows, or has reason to believe, may result in a **personal*** or **financial benefit***, not shared with a substantial segment of the city's population, for any of the following persons or entities (no group of government employees may be considered "a substantial segment" for the purposes of this provision):

- a. himself or herself;
- b. a member of his or her **household***, including a **domestic partner*** and his or her dependents, or the employer or business of any of these people;
- c. a sibling or step-sibling, step-child or foster child, parent or step-parent, niece or nephew, uncle or aunt, or grandparent or grandchild of either himself or herself, or of his or her spouse or domestic partner, or the employer or business of any of these people;
- d. a person with which he or she has a financial or business relationship, including but not limited to:

- a. an **outside employer or business*** of his or hers, or of his or her spouse or domestic partner, or someone who works for such outside employer or business;
 - b. a **client*** or substantial customer;
 - c. a substantial debtor or creditor of his or hers, or of his or her spouse or domestic partner.
- e. a person or entity from whom the **official or employee*** has received an election campaign contribution of more than \$200 in the aggregate during the past election cycle (this amount includes contributions from a person's immediate family or business as well as contributions from an entity's owners, directors, or officers, as well as contributions to the **official or employee*'s** party town committee or non-candidate political committee); or
 - f. a nongovernmental civic group, union, social, charitable, or religious organization of which he or she (or his or her spouse or domestic partner) is an officer or director.

b. The prohibition in (a) above applies equally to attempts to use, act, or influence.

c. It is a violation of this code for an **official or employee*** to, within two years of entering city employment or service, award a contract or participate in a matter benefiting a person or entity that formerly employed him or her.

Comment: The central point of an ethics code is that city officials and employees should not prefer, over the public interest, their own interests or the interests of their family or business associates. There are other relationships that should be included in the above list, but cannot due to problems of defining them. These include romantic relationships short of domestic partnership, and close friends and associates. The general rule is: If it looks to others as if you might be giving someone special treatment, or if it would look that way to others if they knew about the relationship, then you should not act with respect to that person or entity, and instead recuse yourself and withdraw from participation in the matter under **subsection 3** below. It is important to give city residents confidence that their officials and employees are treating everyone the same, even when you believe that you can be totally impartial.

The most common way to define conflict of interest is as follows: No person subject to this code shall have any interest, financial or otherwise, direct or indirect, or engage in any business, employment, transaction or professional activity, or incur any obligation of any nature, which is in substantial conflict with the proper discharge of his or her public duties or employment. *However, most government officials and employees do, on occasion, have conflicting interests. The important thing is not for them to prevent them, but rather to manage them honestly and responsibly, that is, to disclose them and to not act where there is such a conflict, no matter how impartial they feel they can be. What matters is not whether one can still act with integrity, but whether one will be perceived that way. It should be noted that even voting or making a decision against a friend or relative, in order not to seem partial, is not acting impartially, because the reason for the vote or decision is wrong: it might actually be better or more fair to vote or decide in favor of the friend.*

The one thing the common approach contains which does not appear in this model code is a prohibition of outside employment where there is not a conflict with a particular government interest, but instead with the general government interest in "the proper discharge of an employee or official's duties" (a term that, by the way, is too vague to allow for enforcement). Outside employment does not only lead to conflicts of interest as defined in this code, but also interferes with doing one's job by affecting the official or employee's time, energy, and focus. Volunteers are expected to have other jobs, and it is not fair to prevent low-paid employees from having evening, weekend, or holiday jobs, but many cities have rules limiting the amount and type of outside employment. Please contribute outside employment provisions which you feel are just (or unjust), enforceable or unenforceable, and explain why. Such provisions should include procedural requirements, for example, applying for formal, written permission from one's supervisor or department head (including disclosure of any officials, employees, or contractors involved), and the written acceptance of limitations on time and place of outside employment.

There is also nothing in this model code about incompatible positions in government and parties, that is, holding legislative and administrative positions, for example, especially where one office has the power to remove or affect the other's budget; or multiple administrative positions that stretch an official or employee too thin; or non-governmental positions that can have a great effect on government, for example, a department head who is an officer of a local political party, posing a question about his or her responsibility to all citizens vs. to party members, as well as putting him in a position of affecting who his boss will be, come the next election. Often such rules do not appear in ethics codes (often they appear in the city charter), but because they do involve conflicts of interest, they should at least be included by reference. Please say how your municipality deals with this problem, or how you think it should be dealt with. Another common conflict provision is as follows: No person subject to this code shall accept other employment which will either impair his or her independence of judgment as to his or her public duties or employment or require or induce him or her to disclose confidential information acquired by him or her in the course of and by reason of his or her official duties. What does it mean to have a job that impairs one's independence of judgment, or a job that induces or requires one to disclose confidential information? And how could it be proven that particular employment could do this? Again, this sort of provision focuses on the conflict rather than on the improper management of the conflict. It is true that a developer should not be on a zoning board, nor should a contractor be in charge of a city's purchases, at least in the relevant area. But in and of themselves, these are not violations of the public trust (so long as they withdraw from participation when appropriate; but if that is very often, they are not fulfilling the obligations of their position); they are examples of seriously poor judgment on the individual's part as well as on the part of those who nominated or appointed that individual. In addition, when a developer sits on a zoning board, it is a sign of a poor ethics environment, whose leaders have not spoken out against so severe a conflict. Cities may want to add a provision like the following to deal with this situation: The withdrawal provisions of 100(3) do not permit an official or employee to make use of withdrawal on a regular basis. If withdrawal occurs with such frequency as to give the

appearance of impropriety, the official or employee is deemed to have violated the provisions of this code.

Comment: An official or employee who is forced to withdraw from matters (also known as "recusing oneself") on a regular basis should resign from his or her position. This should also be taken into account when a position is accepted.

Another approach to conflicts of interest is to deem something a conflict only to the extent that an interest is not disclosed and the official or employee participates in the matter. This approach recognizes that ignoring a conflict is the principal problem. Such an approach can be combined with defining "conflict of interest" as doing or not doing much of what appears in 100 of this model code, as it is, for example, in Kings County (Seattle), Washington. This makes it clear that the central concept of a conflict of interest takes many forms, but it also limits conflict to particular instances, in effect, saying that all other conflicts are acceptable.

New Haven, Connecticut enumerates several examples of conflicts of interest, as well as several exceptions. This is unusual, but if done thoughtfully and responsibly (being careful not to make the examples exclusive), it can provide clear guidance. The best place for such examples is, however, not in the code itself, but in explanatory guidelines on the city website or in pamphlet form. Here is what New Haven lists:

Sec. 12 5/8-6. Exception to the conflict of interest provisions.

The following situations shall not constitute a conflict of interest under section 209 of the Charter of the City of New Haven:

- a. Where a municipal employee or public official is employed by a person who enters into a contract with the City of New Haven, where said employee or public official is not directly involved in the procurement, preparation, or performance of such contract and whose remuneration is not, directly or indirectly, derived from said contract;
- b. If the municipal employee or public official is employed by any newspaper which publishes any municipal notice, resolution, ordinance or other proceeding where such publication is required or authorized by law;
- c. If the municipal employee or public official is employed by a public utility that furnishes public utility services to the City of New Haven when the rates or charges therefor are fixed or regulated by the public utilities control authority;
- d. If the municipal employee or public official is employed by a person or business which has a contract with the City of New Haven if the total consideration thereunder, when added to the aggregate amount of all consideration payable under contracts in which said employee or public official has an interest during a calendar year does not exceed five hundred dollars (\$500.00).

Sec. 12 5/8-7. Examples of an interest requiring disclosure.

In accordance with article XXIII, section 210, of the Charter of the City of New Haven, interests requiring disclosure shall include, but not be limited to the following:

- a. Where a member of the immediate family of a member of a board, commission or task force is employed by the City of New Haven;

- b. Where a member of a board, commission or task force is employed by a nonmunicipal agency the funding of which is, in part or in its entirety, provided by funds authorized by the City of New Haven;
- c. Where a member of a board, commission or task force serves on the board of directors or governing board of a nonprofit organization when said organization is engaged in the application of federal, state or local funding authorized by the City of New Haven;
- d. Where a member of a board, commission or task force serves on the board of directors or governing board of a nonprofit organization when said organization is lobbying for specific legislation before the City of New Haven or when said organization is lobbying for specific State of Connecticut legislation which will result in the city receiving funding which is controlled by the city board, commission or task force of which the individual is a member;
- e. Where a member of a board, commission or task force serves on the board of directors or governing board of a nonprofit organization when said organization is engaged in litigation against the City of New Haven;
- f. Where a member of a board, commission or task force accepts an offer of employment, whether paid or unpaid, by the City of New Haven or by a program recommended by said task force but has not yet resigned or retired from said board, commission or task force to accept said offer of employment;
- g. Where a municipal employee or public official has a financial or personal interest in a contract which was entered prior to the time of his nomination, appointment, election or employment to said position, so long as said contract is not renewed, amended or modified subsequent to his assuming public office;
- h. Where an employee or public official seeks or obtains employment with a person, company or corporation engaged in business with the City of New Haven but has not yet resigned his position assume said employment;
- i. Where an employee or public official applies for a city program or benefit over which he has control, influence or discretionary authority.

2. Legislators Employed by City

To discuss this provision, click [here](#).

A member of the legislative body has a conflict of interest with respect to any labor contract to which he or she, or a member of his or her **household***, may be a party, and with respect to an appropriation to any city department or agency through which he or she, or a member of his or her household, is employed.

Comment: *Some cities require that there be no incompatible or even multiple offices held by an individual, especially a council member, so that this problem could only arise with respect to members of the household. In towns and small cities, it is more difficult to make such requirements, because there are sometimes too few competent and interested people to go around. Also, withdrawal can take care of instances such as those described in this subsection. But explicit restrictions in this area, especially in large cities, can be valuable.*

3. Withdrawal from Participation

To discuss this provision, click [here](#).

- a. An **official or employee*** must refrain from acting on or discussing, formally or informally, a matter before the city, if acting on the matter, or failing to act on the matter, may **personally*** or **financially benefit*** any of the persons or entities listed in **subsection 1** of this section. Such an official or employee should join the public if the withdrawal occurs at a public meeting, or leave the room if it is not a public meeting.
- b. An **official or employee*** must refrain from acting or discussing, formally or informally, a matter involving a person who appointed or recommended him or her for that position, if he or she is aware of such appointment or recommendation.
- c. If a board or agency member is requested to withdraw from participation in a matter, for the reason that he or she has a conflict of interest, by
 - i. another member,
 - ii. a party to the current matter, or
 - iii. anyone else who may be affected by a decision relating to this matter,

the member must decide whether to withdraw. If the member decides not to withdraw, the unchallenged members must consider any relevant evidence concerning such claimed conflict of interest, as defined in this code, and vote whether or not to allow the request and require that the member withdraw from participating in the matter.

- d. Withdrawal at a meeting requires the public announcement, on the record, of the reason for withdrawal. Withdrawal outside of a meeting requires disclosure in writing of the reason for withdrawal to the official or employee's supervisor.
- e. Ongoing Conflict: An **official or employee*** whose outside employment or other outside activity or relationship can reasonably be expected to require more than sporadic withdrawal must resign or cease such outside employment or activity. If the ongoing conflict involves a relationship, the **official or employee*** must resign. An **official or employee*** should not begin employment or an activity or relationship that can reasonably be expected to require more than sporadic withdrawal. If a prospective **official or employee*** is in such a situation, he or she should not accept the position.
- f. Rule of Necessity: If withdrawal would leave a board with less than a quorum capable of acting, members must disclose their conflicts on the public record, but they may then vote. If an **official or employee*** is the only person authorized by law to act, the **official or employee*** must disclose the nature and circumstances of the conflict to the Ethics Commission and ask for a waiver or advisory opinion.

Comment: "Acting on and discussing, formally or informally" means that the official should withdraw from any involvement with the matter, including conversations, appearances at meetings or portions of meetings concerned with the matter, and voting on the matter, except, of course, in a public referendum.

Sometimes inaction benefits an official or his or her close associates - for example, when a code enforcement official fails to cite her brother for a zoning violation. That is why this subsection prohibits an official's inaction, as well as action, in certain circumstances. In such an instance, the enforcement official should ask someone else to handle the matter.

See [101](#) for provisions concerned with the disclosure of a conflict pursuant to this subsection. Because disclosure in this sort of situation occurs at the time a conflict becomes immediately relevant to an action or transaction to be taken by an official or employee, this is referred to as "transactional disclosure."

4. Gifts*

To discuss this provision, click [here](#).

- a. An **official or employee***, his or her spouse or **domestic partner***, child or step-child, parent, or member of his or her **household***, may not solicit nor accept anything of value, directly or indirectly, from any person or entity that the official or employee knows, or has reason to believe, has received or sought a **financial benefit***, directly or through a relationship with another person or entity, from the city within the previous three years, or intends to seek a financial benefit in the future. If in doubt, the official or employee should refrain from soliciting or refuse a gift, and should first inquire into the person or entity's relationship with the city. [or: If the **official or employee*** does not know whether a person or entity fits this description, he or she should inquire and, if it is discovered that the person or entity does fit this description, the gift should be returned (or its monetary value if it cannot be returned) and no further gifts accepted during the relevant period.]
- b. A person or entity that has, in the last three years, received or sought, or is seeking, a financial benefit, directly or indirectly, from the city, may not give or seek to give anything of value to any official or employee.
- c. Gifts of property, money, or services given nominally to the city must be accepted by a resolution of the legislative body.

Comment: The first sentence of subsection 4a is difficult, even if the language itself is not. Here it is broken down and explained:

Who cannot accept or solicit gifts: An official or employee, his or her spouse or domestic partner, child or step-child, parent, or member of his or her household

What a gift is: anything of value (see the definition at [111\(6\)](#) and the exceptions in [102](#))

Whom one cannot accept gifts from: any person or entity that has received or sought a financial benefit from the city within the previous three years, or that intends to seek a financial benefit in the future. Such persons or entities are usually referred to as "restricted sources."

Must the gift giver have *directly* received or sought a financial benefit from the city? No, it also counts if it sought a financial benefit through a relationship with someone or some entity. See [this City Ethics blog post](#) for an example of indirect benefit.

"

What the official or employee must know about the gift giver's relationship with the city: he or she must know the gift giver's relationship with the city, or know enough that he or she has reason to believe that such a relationship may exist. If uncertain, the gift should be refused and questions asked.

With respect to higher officials and department heads, and for officials and employees who deal directly with contractors and permittees, a city might choose to prevent them from receiving any gifts at all, other than campaign contributions and gifts from close relatives.

Cities have taken a great variety of approaches to the gift problem. The approach here is to limit only gifts from people and entities that do business with or otherwise get financial benefits from the city, including permits, zoning approval, etc. Other common approaches are to limit the amount of gifts or to limit the type of gifts or the type of givers.

There are two principal goals here: (1) to give clear guidance to officials, employees, and potential gift givers; and (2) to ensure city residents that their public servants are not accepting gifts from people and businesses who might be trying to influence them, whether or not that is a purpose for the gift (since no one can ever know the purpose). The choice of the above approach is intended to keep the process simple: if there is any question of the giver's relationship with the city, do not accept the gift. If there is any reason to believe there is an improper motive behind the gift, do not accept it. There are exceptions to this rule below (at 102), but they are few and essentially allow just a lunch or two each year.

Another approach to gift-giving is to require the annual disclosure of all gifts either by itself or in addition to prohibitions. This puts a great deal of pressure on the city's informal oversight resources (citizen and media), since such gifts would be out of the jurisdiction of official boards. Since party organizations provide the most effective informal oversight in most communities, depending on disclosure will politicize this part of the city's ethics process. Here is language for that approach:

Officials and employees must file with the Ethics Commission, on or before January 31, a list of all gifts received during the preceding calendar year by them or by their spouse or domestic partner, child or step-child, parent, or member of their household, to the extent that the aggregate amount of gifts received from an individual or entity (including gifts from all employees, partners, or investors) during the year is \$50 or greater.

Information to be disclosed is as follows:

1. the date the gift was received and who received it;
2. a description of the gift;
3. the fair market value of the gift;
4. the name, address and employer of the person who provided the gift;
5. the name of any organization or individual represented by the person or on whose behalf the person was acting in providing the gift.

Another common approach, which I included as an alternative in my original text, is to make it a violation of the ethics codes to take gifts with an understanding that some action will occur or not occur in return (usually the language includes the word "influence"). The problem is that this is not an ethical issue, but rather a crime. The gift

is no longer a gift, but a bribe. Ethics commissions have no jurisdiction over this sort of crime, so it is best that this language not appear in an ethics code.

If an official or employee purchases goods, rents, or accepts a loan from a restricted source, and is not certain whether it has been discounted and is therefore a gift, the official should declare it, since there is an appearance of impropriety either way. And then the restricted source should be required to prove to the ethics commission that no discount was given. The restricted source can better handle this burden, since it has better access to the necessary information. At the end of the process, there will either be no more appearance of impropriety, or the official will not make the purchase, rent from the restricted source, or accept a loan from the restricted source.

5. Representation

To discuss this and the following provision (Appearances), click [here](#).

An **official or employee*** may not represent any other person or entity before the city, nor in any matter not before the city, but against the interests of the city. However, it is acceptable for elected officials to represent constituents without compensation in matters of public advocacy.

Comment: The second sentence of this subsection recognizes that officials are elected to serve their constituents. Thus, for example, when a resident complains to a council member that the public works department blocks the resident's driveway with snow, a council or board member must be able to pursue that complaint with the proper city authorities.

Some cities go into more detail and cover more people in their limitations on representation. Such provisions include the representation by business associates of officials and employees, and acting as an expert witness before the official or employee's board or agency.

6. Appearances*

To discuss this and the previous provision (Representation), click [here](#).

An **official or employee*** may not **appear*** before any city department, agency, board or commission, except on his or her own behalf or on behalf of the city. Every time an official or employee appears before the meeting of any municipal body, or when he or she writes a letter to the editor or other publicly distributed writing, he or she is required to disclose before speaking or clearly on the writing whether he or she is appearing in an official capacity or as a private citizen. If the speech or writing is in response to criticism or other communication directed at or regarding his or her official role, the official or employee may respond only in his or her official role.

Comment: Subsections 6 and 7 appear to overlap, because one who represents another usually makes an appearance. However, it is much more clear when an "appearance" has been made than when there is a "representation" relationship, so including both makes it more clear what conduct is being prohibited. Also, subsection 6 includes representation of private interests outside of the city's own boards and departments, when it is against the interests of the city, usually but not exclusively when the city is a party to business or a proceeding. And subsection 7 deals with

appearances where the official is representing himself or herself, but it is not clear which hat the official is wearing.

Again, the general rule is that if others see your relationship with a person or entity as "representation," then you should not do it, because it would be perceived as a conflict with your principal role of representing the city. Similarly, if your appearance at a meeting or in writing does not appear to be in the city's interest, you should not appear. Why are officials and employees restricted from appearing before boards or agencies other than their own? Because restricting only appearances before your own board or agency would, for example, allow a code-enforcement official or the city attorney to represent private clients before the city planning board, because those officials are not members of that board. It would be very difficult to list every possible instance where an appearance before other boards and agencies would be inappropriate. When there is no such conflict, an official or employee should obtain a waiver from the Ethics Commission pursuant to [210](#).

Some municipalities may go beyond actual representation, and include assistance or legal assistance, with an exclusion for representation or assistance in the performance of the official or employee's official duties.

For volunteers, towns might want to limit restrictions on representation and appearances to their own board or commission, especially those on boards where the opportunity for conflict elsewhere is very small, such as the library board. A list of boards where this exception applies could be added to a subsection 8 that read:

8. Volunteer members of the following boards and commissions may represent persons and entities before, or appear before, any town department, agency, board, or commission other than their own.

7. Confidential Information

To discuss this provision, click [here](#).

An **official or employee***, a former official or employee, a contractor or a **consultant*** may not use confidential information, obtained formally or informally as part of his or her work for the city or due to his or her position with the city, for his or her own benefit or for the benefit of any other person or entity, or make such information available in a manner where it would be reasonably foreseeable that a person or entity would benefit from it.

Comment: Some cities will want to define "confidential information" more exactly. Here is possible definition language, based on the IMLA Model Code:

"Confidential information" means information obtained in the course of holding public office or employment, or as a contractor to the city, which is not available to members of the public and which the **official or employee*** is not authorized to disclose, except to designated individuals or bodies, including written and non-written information. When such information is also available through channels open to the public, **officials and employees*** are not prohibited from disclosing the availability of those channels.

The IMLA Model Code states explicitly, in its confidential information provision, that an ethics commission is, effectively, considered a designated body.

New York City adds a valuable exception to its confidential information provision:

"provided, however, that this shall not prohibit any public servant from disclosing any

information concerning conduct which the public servant knows or reasonably believes to involve waste, inefficiency, corruption, criminal activity or conflict of interest."

8. Political Solicitation

To discuss this provision, click [here](#).

An official, employee, or municipal candidate may not knowingly request, or authorize anyone else to request, that any **subordinate*** or potential future subordinate participate, or not participate, in any political activity, including the making of a campaign contribution. Nor may he or she engage in any political activity while on duty for the city, with the use of city funds, supplies, vehicles, or facilities, in uniform, or during any period of time during which he or she is normally expected to perform services for the city, for which compensation is paid.

Comment: Political solicitation of subordinates by an official fosters the appearance, if not the reality, of coercion. The word "knowingly" here means that neither an official nor a campaign committee is required to cull the names of municipal officials from voter registration lists it mails to. However, a targeted mailing to municipal officials is prohibited.

Similarly, candidates are barred from soliciting from appointed officials and employees who may fear reprisal, such as being fired, if they refuse to aid the candidate's campaign, even if they do not currently work under that candidate.

Note that this code does not restrict voluntary political contributions or political activity by any official or employee.

Some municipalities may wish to add a bar on soliciting from persons or entities that have sought or received a financial benefit from the municipality within the previous twenty-four months.

9. Patronage

To discuss this provision, click [here](#).

No **official or employee*** may promise an appointment or the use of his or her influence to obtain an appointment to any position as a reward for any political activity or contribution.

Comment: As has been shown so skillfully in Chicago, patronage involves both promises of jobs in return for political activity, and the threat of losing jobs in return for political activity, so that patronage continues on forever. Even the Shakman Decree of 1983 did not put an end to the Chicago patronage system: it just went underground. It was twenty years before the new version, based on fraud, was taken on.

Most ethics codes do not include patronage provisions, although many do prohibit asking subordinates to participate (however, this can occur without implicit requests or threats). Patronage involves the most basic conflict of interest in government: the conflict between holding on to power and acting in the public interest. A city government based on patronage cannot have a truly ethical environment, because most of its officials and employees are there on the basis of a quid pro quo/special consideration relationship, which is inconsistent with ethics.

I would like to hear how various cities have dealt with or ignored patronage as an ethics issue.

10. Post-Employment

To discuss this provision, click [here](#).

a. **Representation.** For a period of two years after the termination of his or her city service or employment, an **official or employee*** may not, on behalf of any other person, for compensation, directly or indirectly, formally or informally, act as agent, attorney, lobbyist, or other sort of representative, to or before his or her former agency, department, authority, board, or commission. For the purposes of this provision, a mayor, chief of staff or vice-mayor, city manager or assistant manager, council member or council aide is deemed to have worked for every city department, agency, authority, board, and commission. Acting indirectly includes action by a partner, associate, and other professional employee of an entity in which the former official or employee is a partner, associate, or professional employee, as well as acting by a member of the former official or employee's immediate family.

b. **Particular Matters.** With respect to particular matters on which the official or employee personally and substantially worked while in city service or employment, the foregoing prohibition is permanent.

c. **Area of Responsibility.** With respect to matters for which the official or employee had official responsibility, but were not personally and substantially involved, the foregoing prohibition is for a period of two years after termination of city service or employment.

d. **Employment.** An **official or employee***, or a member of his or her immediate family, may not accept employment with, or with the help of, (a) a party to a contract with the city, within two years after the contract was signed, when he or she participated personally and substantially in the preparation, negotiation, or award of the contract, and the contract obliged the city to pay an aggregate of at least \$25,000; or (b) an individual or entity who has, within the previous two years, benefited directly from any decision made by, or based on advice or information supplied by, the official or employee or by a subordinate. An elected or appointed official, or a member of his or her immediate family, may not accept employment if the body of which he or she is a member or was a member within the previous two years had any role in filling the job, including an advisory role. A mayor, chief of staff or vice-mayor, or council member, or a member of his or her immediate family, may not, for two years after termination of city service or employment, accept any full-time compensated position with the city. For the purposes of this section, "employment" includes full-time and part-time jobs, and professional and other work for hire, given directly or indirectly.

e. **Exceptions.** Former officials and employees are not prohibited from acting if:

1. They are working for the city on a volunteer basis.
2. They are acting on behalf of another federal, state, or local government.
3. They are giving testimony under oath and is not being compensated for it.
4. They are providing scientific or technological information at the government's request.
- e. They performed only **ministerial acts***.

f. **Waivers.** The Ethics Commission may waive the prohibitions of this provision if it determines that the situation does not create a potential for undue influence, unfair advantage, or a serious appearance of impropriety. See **§210** for the waiver process.

Comment: "Personally worked" means the official actually worked on the matter, not that he or she supervised a department that worked on the matter, which is included under having "official responsibility."

The appearance of impropriety of getting a job based on what you did as a city official or employee is so great that each official or employee should err on the side of not seeking or accepting work with people or firms that had business before his or her agency or board.

If an official or employee is not certain whether this provision applies to work they are seeking or are requested to do, and does not want to turn it down, he or she should ask the Ethics Commission for an advisory opinion or a waiver.

This provision is intended to, as stated in the waiver section, prevent people and firms from having undue influence or unfair advantage by hiring officials and employees to help them use their contacts before their agencies or boards. In addition, it is intended to make it harder for firms to use a job offer to get special treatment from officials and employees. And it is intended to prevent officials and employees from using their positions to gain jobs with firms that have business before them and, similarly, to prevent the appearance of impropriety that arises when an official takes a job with a firm that had business before his or her agency or board.

In short, it is important that officials focus on the public interest while in office, and not have an incentive to give preferential treatment to firms or individuals who may hire them when they leave public service.

One year is too short a time period to accomplish the goals of a post-employment provision, but the longer the bar, the more difficult it might be to hire qualified officials or find qualified candidates for office. This is the trade-off every local government must make in setting the time period. Two years is a reasonable compromise between effectiveness and the burden on government officials.

Allowing former officials to immediately work for the city as paid consultants would allow the official to continue to act in the city's interest, but such an exception would allow for sweetheart deals between the city and former officials, who normally have the edge in competing with vendors lacking their municipal contacts. Therefore, according to this subsection, a former official could consult to the city only on a volunteer basis for his or her first year after city service.

*The **confidential information provision** also applies to former officials and employees. And the other side of the revolving door, from business to government, is dealt with in **§100(b)**, as a conflict of interest.*

11. Misuse of City Property and Reimbursements

To discuss this provision, click [here](#).

An **official or employee*** may not use, or permit others to use, any city funds, property, or personnel for profit or for **personal convenience or benefit**, except (a) when available to the public generally, or to a class of residents, on the same terms and conditions, (b) when permitted by policies approved by the local legislative body, or (c) when, in the conduct of official business, used in a minor way for personal convenience. "City funds" includes travel and other expense reimbursements, which may not be requested for nor spent on anything but official business.

Comment: *The IMLA Model Code takes this further by requiring care in the use of city property, so that there is no waste. This is an essential element of government ethics, but it is a difficult thing to put into law. People - especially opposition parties - often paint other people's actions as wasteful and negligent. The duty to use city property and resources with care belongs in the aspirational section of an ethics code, or it invites frivolous complaints, making it almost impossible to reject any complaint as frivolous.*

12. Nepotism

To discuss this provision, click [here](#).

No **official or employee*** may appoint or hire, or participate in influencing the appointment or hiring of, his or her spouse or **domestic partner***, child or step-child, sibling or step-sibling, parent, or member of his or her **household*** for any type of employment, including by contract (unless competitively bid), with the city. No **official or employee*** may supervise or be in a direct line of supervision over his or her spouse or **domestic partner***, child or step-child, sibling or step-sibling, parent, or member of his or her **household***. If an **official or employee*** comes into a direct line of supervision over one of these persons, he or she will have six months to come into compliance or to obtain a waiver.

Comment: *Some cities might also want to broaden the range of relations that constitute nepotism to include, say, aunts and uncles, nephews and nieces, and direct in-laws. Comments should include a statement that officials should not participate with respect to the hiring of relatives not expressly included in the list, even if this is not clearly a violation. It is always best to stay out of any dealings that involve relatives.*

*This is a popular provision in terms of requests for **waivers**, and for good reason. There are situations where enforcing this provision would mean the resignation of a valuable employee. As important as it is to prevent nepotism, this prohibition needs to be balanced against other considerations.*

Here is an interesting provision from Oakland, CA, which combines a prohibition against nepotism with one against cronyism, which is defined as follows:

participating in any employment decision that may be viewed as a conflict of interest, such as one involving a close friend, a business partner, and/or professional, political, or commercial relationship, that would lead to preferential treatment or compromise the appearance of fairness.

*The provision, §2.40.060 (Title 2, Ch. 2.40 of the **Oakland Municipal Code**), reads as follows:*

No official, manager or employee may engage in cronyism and/or attempt to influence the City or any official, manager or employee, to hire, promote, or change the terms and conditions of employment of any individual with whom that person has a family relationship, consensual romantic relationship or cohabitant relationship.

13. Transactions with Subordinates

To discuss this provision, click [here](#).

No **official or employee*** may engage in a financial transaction, including the giving or receiving of loans or monetary contributions, including charitable contributions, with a

subordinate* or person or business over which, in the **official or employee's*** official duties and responsibilities, he or she exercises supervisory responsibility, unless (a) the financial transaction is in the normal course of a regular commercial business or occupation, or (b) the financial transaction involves a charitable event or fundraising activity which is the subject of general sponsorship by a state or municipal agency through official action by a governing body or the highest official of state or municipal government.

Comment: Exception (b) allows for United Way campaigns and the like, but officials should be careful not to abuse this exception by getting pet charities approved by the mayor or city manager. *Too often, charities are as much about the official as elections are, and even good causes should not be aided through coercion.*

Some cities might also want to except situations where the subordinate or business offers or initiates the financial transaction, but this exception can be abused in instances where a subordinate or business acted under pressure and does not feel in a position to anger a supervisor or someone responsible for handing out contracts.

14. Fees and Honorariums

To discuss this provision, click [here](#).

No **official or employee*** may accept a fee or honorarium for an article, for an appearance or speech, or for participation at an event, in his or her official capacity. However, he or she may receive payment or reimbursement for necessary expenses related to any such activity.

15. Endorsements

To discuss this provision, click [here](#).

No **official or employee*** in his or her official capacity may publicly endorse products or services. However, this does not prohibit an official or employee from answering inquiries by other governmental officials, consumer organizations, or product information services regarding products or services.

16. Consultants*

To discuss this provision, click [here](#).

A **consultant*** may not represent a person or entity other than the city in any matter, transaction, action, or proceeding in which the consultant participated personally and substantially as a consultant to the city. Nor may a consultant represent a person or entity in any matter, transaction, action, or proceeding against the interest of the city.

Comment: Other rules that apply expressly to consultants are **100(8)** (Confidential Information), **100(21)** (Honesty in Application for Positions), and **101(2)** (Transactional Disclosure). Also see the comments to **100(11)**, the post-employment provision.

Many codes also include language such as: A consultant may not accept other employment that will either impair the consultant's independence of judgment with respect to the consultant's official duties for the city, or that will require or induce the consultant to disclose confidential information pursuant to **subsection 8** of this section.

*The same problem appears as in the comments to **100(1)** above: how does one know or prove that employment will impair someone's judgment or induce someone to*

disclose confidential information? It is enough that consultants are prevented from representing parties against the city or in matters the city hired them to deal with, and that they be included in the confidential information provision, 100(8).

17. Complicity with or Knowledge of Others' Violations

To discuss this provision, click [here](#).

No one may, directly or indirectly, induce, encourage, or aid anyone to violate any provision of this code. If an **official or employee*** suspects that someone has violated this code, he or she is required to report it to the relevant individual, either the employee's supervisor, the board on which the official sits or before which the **official or employee*** is **appearing*** or will soon appear, or the Ethics Commission if the violation is past or if it is not immediately relevant to a decision, to discussion, or to actions or transactions. Anyone who reports a violation in good faith will be protected by the provisions of 110.

Comment: *This subsection seems to turn all city officials and employees into stool pigeons. But, in fact, a principal reason why ethics programs are ineffective is that officials and employees feel they can get away with unethical conduct because no one will turn them in. Instead of having a culture based on ethics, their city has a culture based on loyalty. People in such a city ignore conflicts of interest, because they feel protected. There are two reasons for this: (i) no one wants to be a tattletale and (ii) everyone is afraid to be a tattletale, because doing so might threaten their jobs, lead to harassment and failure to advance, or undermine their relations with people in power. This subsection, along with the whistle-blower protection in 110, allows the people who know most what is going on in city government - city employees - to safely foster an ethical environment by preventing action in the public interest from being against their self-interest. The inclusion of this provision makes it clear to all officials and employees that government ethics is a group activity, that unethical behavior is less an individual problem than an organizational problem.*

Such a provision appears in the IMLA Model Code; the comments to the IMLA provision state, in part, "Even if a community ultimately decides not to impose any duty [to report violations], it would be better off for having debated the issue."

Whether or not anonymous reports would be accepted is another area for debate.

Creating a hotline for reports of violation (anonymously or not) makes it easier for city employees and others to fulfill their duty to report violations. As long as the ethics commission can file its own complaint in such an instance, there is the protection for respondents that the ethics commission must feel satisfied, after a preliminary investigation, in the truth of the report. People's experiences with such hotlines, good and bad, would be very helpful, as would information about debates about the duty to report and about hotlines and anonymous reporting of violations.

Back to tattling, which is rarely defended in a rational way. Not tattling is something very important in childhood, where it helps maintain solidarity of children against adults. But for adults there is not a group to maintain solidarity against (hopefully not the city's residents, to whom officials have a fiduciary duty) and, therefore, this sort of unquestioning loyalty is inappropriate. The best thing to do, before reporting, is to try to prevent unethical conduct before it occurs, to directly recommend, for example, that someone withdraw from participation or seek advice from the ethics commission. But it

is important that officials and employees know that unethical conduct will not be protected by the silence of fear or misplaced loyalty.

The first sentence of this subsection, on complicity and inducement, is equally important. Under most ethics codes, a private citizen or company that induces a municipal official to violate ethics laws runs no risk of penalty. For example, hoping to keep a city's business, a bank might give a personal loan to the city treasurer at a below-market interest rate. If this loan is discovered, the official might lose his or her job as a result; however, the bank will lose nothing and, more important, knowing this, it is more likely to offer the loan. Since the goal of this code is to prevent conflicts between the official's interests and the public interest, it is important that the code also make it less likely that officials are tempted into these conflicts. Please share your experiences with provisions such as this, including instances where suits have been brought, arguing that ethics commissions have no jurisdiction over anyone other than public servants.

18. Falsely Impugning Reputation

To discuss this provision, click [here](#).

An **official or employee*** may not falsely impugn the reputation of a city resident. If an **official or employee*** believes his or her accusation to be true, and then learns that it was false, even in part, he or she should apologize in the same forum the accusations were made. A failure to so apologize within a reasonable period of time after learning of the falseness of the accusations will create the presumption that the conduct was fully intentional.

Comment: A common way for officials to intimidate residents who speak out and to prevent others from similarly speaking out is to use their positions of respect to falsely attack people who lack such positions, and thereby destroy their reputation and the legitimacy of their arguments, so that opposition from that individual and others will lessen. This form of misuse of office is central to undermining free debate as well as citizen oversight of executive and legislative actions.

19. Meeting Attendance

To discuss this provision, click [here](#).

All members of boards and commissions are expected to attend their meetings. It is a violation of this code to miss more than a third of a board or commission's meetings in a twelve-month period.

Comment: This might seem rough, but it is rough on a board when its members do not attend meetings. In fact, it can make quorums difficult and, thereby, undermine the functioning of the board. If a board member has health problems, lives out of town a large part of the year, or has ongoing scheduling problems, the responsible thing to do is resign. If things change in the future, the board member can ask to be appointed when the next position opens up. Reappointment should be easy for someone so responsible.

20. Honesty in Applications for Positions

To discuss this provision, click [here](#).

No person seeking to become an **official or employee,* consultant*** or contractor may make any false statement, submit any false document, or knowingly withhold information about wrongdoing in connection with employment by or service for the city.

To discuss other provisions, including those suggested below, click [here](#).

Additional Comment to 100: Some codes, including the IMLA Code, make it an ethical duty to comply with laws, including criminal laws, discrimination and sexual harassment laws, and lobbying laws. The chronic violation of more minor laws and rules is also sometimes cited.

It is a difficult question whether to involve an ethics commission with every violation of law. Criminal and other undesirable activity by public servants certainly undermines the public trust in municipal government. But is the ethics process the right place to deal with such matters, or are they better dealt with by supervisors or, in the case of elected officials, by voters? The duty to comply with laws is not included here because, as long as the violation of other laws is made public, criminal and other proceedings should deal with them as well as the ethics process. However, if the violation is somehow hidden from the public, it might be appropriate for an ethics commission to make the violation public. Has anyone seen language to this effect?

I believe that cities should consider special ethical guidelines and rules for city attorneys. This is a complicated area, where it is sometimes not clear what it means to represent the city (the mayor, the council, the public interest in such things as truth, openness, and a fair process). I feel that guidelines are important not only for attorneys, who often do not recognize the special conflicts they face, but also to protect the public interest, which is harmed by city attorneys who ignore conflicts in the name of representing their client. Who their client is in each sort of instance needs to be clarified. Attorney conflicts of interest are covered by their state's disciplinary rules, but (i) these rules are enforced by lawyers rather than city residents; and (ii) these rules do not deal with the special conflicts that city attorneys are faced with. I would like to see a discussion about it, including recommended provisions to deal with the problems practitioners, both lawyers and non-lawyers, have witnessed.

101. Transactional Disclosure.

To discuss this provision, click [here](#).

1. Whenever an **official or employee*** has reason to believe that he or she should withdraw from participation under **§100.3** of this code, he or she must:

- a. immediately refrain from participating further in the matter, formally or informally;
- b. promptly inform the appropriate individual or body, pursuant to subsection 3 below, that he or she has a conflict, and the nature of the conflict; and
- c. promptly file with the ethics commission [or city clerk, if there is no commission] a signed statement disclosing the reasons for withdrawal or, if a member of a board or commission, state this information on the public record of that board or commission.

Comment: *In subsection 1(c) and in 104(2) there are references to placing information on the public record. This appears to assume that municipal meetings have a published transcript or, at least, a recording, video or aural, that is available to the public. But especially in smaller cities and towns, and in less important meetings, this is not the case. How have cities dealt with this problem of not having a public record to place disclosures on? Is it required that minutes include all disclosures?*

2. Whenever someone suggests or requests (privately or publicly) that an **official or employee*** withdraw from participation under §100.3 of this code, and he or she chooses not to do so, he or she must promptly file with the ethics commission [or city clerk, if there is no commission] a signed statement disclosing the reasons for refusing to withdraw or, if a member of a board or commission and if the suggestion was made publicly at a meeting of that board or commission, state this information upon the public record of that board or commission.

Comment: *See the comment to 100(3) for more information.*

3. An **official or employee*** is required to inform the appropriate individual or body pursuant to subsection 1b, as follows:

- a. If a member of a board, commission, committee, or authority, inform the chair or the entire body at a public or executive session (if at an executive session, the disclosure should also be made after going back into regular session); if the chair, inform the secretary;
- b. If not on such a body and appointed by the city manager/director of administration/mayor, inform the city manager/director of administration/mayor;
- c. If an employee of the Board of Education, inform the Superintendent of Schools;
- d. If the Superintendent of Schools, inform the chair of the Board of Education;
- e. If an elected official, inform the mayor;
- f. If a **consultant,*** inform the chair or head of the board, department, or agency that hired the consultant.

4. An **official or employee*** with an interest in a contract must disclose this interest prior to the first of any of the following events of which the official has knowledge:

- a. The preparation of the contract specifications.
- b. The solicitation of the contract.
- c. The bidding of a contract.
- d. The negotiation of a contract.
- e. The approval of the contract.

5. An **official or employee*** need not make a disclosure pursuant to this section if he or she, with respect to the same matter, has already made such a disclosure.

Comment: *Transactional disclosure provides specific disclosure when a conflict arises, that is, when an official or employee's personal relationship or interest actually creates a conflict with the public interest. It is at this point that it is most important that the official or employee seriously consider the effects of this conflict on his or her actions or judgment, as well as the effects on how his or her involvement would appear to the public if it knew about the conflict.*

Subsection 3: These specific guidelines to informing of conflicts should be adapted to each city's particular form and structure.

102. Exclusions from the Code of Ethics and from Transactional Disclosure.

To discuss exclusions and waivers, click [here](#).

The provisions of 100 and 101 of this code do not require withdrawal or transactional disclosure as a result of:

1. An action specifically authorized by statute, rule, or regulation of the State of _____ or of the United States.
2. A **ministerial act***.
3. **Gifts*** (a) received by the **official or employee*** from his or her parent, spouse or **domestic partner***, child or step-child, or sibling or step-sibling; (b) received by the official or employee, his or her spouse or domestic partner, child or step-child, parent, and member of his or her **household***, from a person or entity (any person who works for or is otherwise related to an entity is considered as having given on behalf of that entity), having an aggregate value of \$50 or less during any twelve-month period; or (c) accepted on behalf of the city and transferred to the city pursuant to **100(4)(b)**.
4. **Gifts*** or **financial benefits*** having a value of \$50 or less that are received by a city official or employee for the solemnization of a marriage officiated by that official or employee at a place other than his or her normal public place of business and at a time other than his or her normal work hours.
5. Public awards from charitable organizations having a value of \$100 or less.

Comments: *Subsection 3 contains an annual dollar limit for gifts given to an official or employee plus his close relations. Many ethics codes' dollar limits are per gift, usually around \$50, in the belief that taking an official out to lunch is acceptable. However, such a limit is easy to get around by giving lots of small gifts to officials and their relatives, which add up to large gifts over time. Another way around such a rule is to give large gifts that are naturally spread out over time, such as a restaurant or club tab, or season tickets. Other codes' gift rules contain many detailed instances and amounts, for such things as private or public or charitable functions. A simpler rule, with an annual limit, is more clear and therefore provides better guidance. I would like to hear people's opinions about this, as well as their experiences with the approaches: how successful they've been, how they've been enforced, etc.*

103. Annual Disclosure.

To discuss this provision, click [here](#).

1. Officials, Employees, and Others Who Are Required to File.

Those holding the following job titles or positions are required to file a signed annual disclosure statement:

1. Elected officials;

2. Department heads and those authorized to act on their behalf (e.g., first deputies);
3. **Officials and employees*** who hold policymaking positions, including members of municipal boards, such as ethics commissions, finance boards, planning and zoning boards, boards of zoning, buildings, and assessment appeals, wetlands and conservation boards, economic development boards, and parks and recreation boards;
4. Officials whose job descriptions or whose actual duties involve:
 - i. The negotiation, authorization, or approval of contracts, leases, franchises, revocable consents, concessions, variances, special permits, or licenses;
 - ii. The purchase, sale, rental, or lease of real property, personal property, or services, or a contract for any of these;
 - iii. The obtaining of grants of money or loans; or
 - iv. The adoption or repeal of any rule or regulation having the force and effect of law;
 - v. candidates for elected office;
 - vi. political party committee officers; and
 - vii. **relatives of officials and employees** who, pursuant to subsection 5(d) of this section, are required to file because they are employed by the city, but who would not otherwise be required to file.

2. Time and Place for Filing.

a. Annual disclosure statements (for the calendar year) are to be filed with the Ethics Commission:

- (i) Within one-hundred-and-twenty days after the effective date of this section;
- (ii) Within thirty days after taking one of the job titles or positions listed in subsection 1 of this section; and
- (iii) No later than May 15 of each year thereafter.

b. For candidates for elected office:

- (i) With the filing of the certificate of candidacy or declaration of intent.
- (ii) No later than May 15 of each year thereafter. If an annual disclosure statement is overdue and is not filed within 20 days after the candidate receives from the Ethics Commission written notice of the failure to file, the candidate is considered to have withdrawn his or her candidacy.

3. Changes in Disclosed Information.

Within thirty days after a change in the information contained in his or her most recently filed annual disclosure statement, an official, employee, or candidate must file a signed amendment to the statement (as in subsection 2), indicating the change.

4. Contents of Annual Disclosure Statement.

The annual disclosure statement will include:

a. The location of any real property in the city, or within one mile of the boundary of the city, in which the person disclosing, or his or her **relative***, has a **financial interest***, and the type of financial interest.

b. With respect to each **outside employer or business*** of the person disclosing:

- (i) Its name (if any);

- (ii) The nature of its business;
- (iii) If it is an entity, the type of entity;
- (iv) The person disclosing's relationship to it, such as sole proprietor, owner, partner, official, director, member, employee, bondholder, or shareholder.
- c. With respect to each **outside employer or business*** of the person disclosing's spouse or **domestic partner***, the information required by paragraph (b) of this subsection.
- d. The names and addresses of all **relatives*** employed by the city as employees, contractors, or **consultants***, including **relatives*** who work for or are subcontractors of contractors, **consultants***, or subcontractors.
- e. Failure to disclose the information required by subsection 4 of this section with respect to a person disclosing's spouse or other **relative*** does not constitute a violation of that subsection if the person disclosing made a good faith effort to obtain the information and if he or she also sets forth those efforts in his or her disclosure statement.

5. Any person who is subject to the disclosure provisions of this and the following subsection is required to obtain and preserve, for a period of three years following the date of the relevant disclosure statement, all accounts, bills, receipts, and other documents necessary to complete and substantiate such disclosure statement. These documents will be made available for inspection upon request by the Ethics Commission or its agent after reasonable notice.

6. The Director of Finance must certify to the Ethics Commission, no later than May 15 of each year, a list of all business entities doing business with the city, currently bidding for business with the city, or that have done business with the city over the prior three years. This list will be made available to the public at no cost.

Comment: While less significant than transactional disclosure, annual disclosure does fill an important role in an ethics program. In particular, annual disclosure reveals potential conflicts of interest before they arise and thus alerts the official - and the citizenry - to those potential conflicts. Annual disclosure thereby provides a check on transactional disclosure and protects officials by identifying potential ethical pitfalls, which the official can then take steps to avoid.

Politicians often focus their condemnation of ethics codes on annual disclosure statements. They insist that forcing people to disclose their interests will prevent people from getting involved in city government. But the disclosure statements in this model code are far from what, say, U.S. Senators are required to file. No one is being asked to disclose how wealthy or poor they are. They are only being asked to say who their employer is (not what they're paid), what local companies they have financial interests in (not how big their interest is), what land they own in the municipality, and which of their relatives work for the city. The only people who will truly mind disclosing this information are those who have so many interests or involved relatives, or so much land in town, that they probably would face many conflicts of interest and, therefore, should probably not be involved in city government, except in areas that do not deal with businesses, developers, or contractors. After all, the biggest complaint people have about municipal governments is that they're run by local businessmen, developers, and contractors, those who represent them, and their relatives. This problem is only compounded when officials do not want to admit publicly what they do for a living.

Some cities will want to go beyond these minimal disclosure requirements, especially for senior officials. Such cities will want annual disclosure of all information directly relevant to the ethics code, including all interests, direct and indirect, that might conflict with government responsibilities (see 100(1) above). Major debtors and creditors may also be listed, as well as any applications made to the city during the year. It may be specified that the disclosure statement is being filed under oath.

Subsection 1: For the sake of clarity, each municipality should list the job titles or positions of the persons required to file annual disclosure statements.

Subsection 2: May 15 was chosen because it is one month after personal income tax returns are due, providing them with both fresh information and the time to prepare the disclosure statement.

Subsection 4: In the event a person disclosing, after a good faith effort, is unable to obtain the required information from an estranged spouse or from a relative, he or she need only set forth his or her efforts in the disclosure statement; there is no need to review land records.

Subsection 6: Information in disclosure statements is useful only if it can be checked against information. That is the purpose of this subsection: to allow the comparison of an official's business connections with a list of businesses that do business with the city. Should failure to file a disclosure statement be a violation requiring a complaint to be filed, placing the burden on citizens or the ethics commission and requiring an investigation and hearing for a clear-cut violation? Or should the burden be on the person disclosing to file (at least a request for a 30-day extension), requiring from the ethics commission only a notice and a reasonable length of time before a stated penalty is automatically due?

There have been cases, such as in Rhode Island, where a large number of officials did not file disclosure statements, making it almost impossible for the ethics commission to take action against them all (it is my understanding that they chose to go after the governor first). A late fee and serious penalty for not filing would require officials to take the requirement seriously. I would like to know others' experiences with enforcement of annual disclosure.

104. Disclosure by Applicants.

To discuss this provision, click [here](#).

1. When a person requests that the city, or a city **official or employee***, take or refrain from taking any action (other than a **ministerial act***) that may result in a **financial benefit*** to either any official or employee or to one of the other persons listed in 100(1) of this code, the person requesting must disclose the name of any such person or persons, to the extent of his or her knowledge at the time of the request.

2. If the request is made in writing, the disclosure must accompany the request. If the request is oral and made at the meeting of a public body, the disclosure must be set forth in the public record of the body. If the request is oral and not made at the meeting of a public body, the disclosure must be set forth in writing and filed with the city clerk, who will send a copy to the Ethics Commission.

Comment: An example of how this section works is that an applicant for a zoning variance is required to list the name of any city official or employee, or others listed in

100(1), who might benefit from the granting of the variance. Applicant disclosure provides a check on transactional and annual disclosure.

This section does not require that the applicant research which officials, if any, have an interest in the matter, but only requires that the applicant disclose the names of interested officials to the extent the applicant knows of the interest. Also, the section imposes no burden on the applicant to update the disclosure if the applicant later learns that certain officials have an interest in the application.

105. Advisory Opinions.

To discuss advisory opinions, click [here](#).

1. Upon the written request of any **official or employee***, including former officials and employees whose position was terminated within three years as well as people who intend to soon become an official or employee, as well as any candidate, **consultant**, or person or entity doing business with the city, or person or entity doing business with or seeking a special benefit from the city, or intending to soon do so, the Ethics Commission must render, within fifteen days after the date of its next regular meeting, a written advisory opinion with respect to the interpretation or application of this Code with respect to future actions only. If an earlier response is desired, or if the Ethics Officer determines that the situation does not require a formal advisory opinion, an informal verbal or e-mail opinion will be provided by the Ethics Officer. For more information about advisory opinions, see **Section 209** of this code.

2. Any person or entity may request informal advice from the Ethics Officer about any situation, including hypothetical situations, but such advice is not binding and there are no time requirements.

Comment: For more information about advisory opinions, see **209**, in the Administration part of this code. The Ethics Commission's other duties are set forth in the Administration part of this code, which is of interest to most people only in extreme situations. But all officials and employees, as well as many residents, will have occasion to take advantage of the Ethics Commission's or Ethics Officer's advice. And this is the Ethics Commission's most important responsibility. It is very important for local government officials and employees, whenever they are uncertain as to whether they should proceed with a matter, to immediately seek advice. This will prevent unethical conduct from occurring due to a lack of knowledge or understanding, and will create a series of precedents to guide officials and employees in the future.

In smaller jurisdictions that do not provide for paid staff, ethics officers sometimes work on a volunteer or part-time basis (and ethics officers can be shared among small jurisdictions). They can be very helpful in providing quick advice before possible conflicts can cause problems. Ethics Commissions rarely meet often enough to provide timely advice, and town, city, and county attorneys rarely have the training, and rarely are unbiased enough, or seen as unbiased enough, to provide trustworthy advice.

There is nothing worse than having an official told by a government attorney that he or she can do (or not do) something which, whether a violation of the ethics code or not, would undermine citizens' trust in their government officials. And yet this happens all the time. A truly neutral ethics officer can prevent this from happening.

Although it is common for informal ethics advice not to be binding on the ethics commission and not to require an official to follow it, if the informal ethics advice is put

into writing, and the facts are confirmed by the requester, it is best to treat the informal ethics advice as binding on both the requester and the ethics commission.

106. Void Contracts.

To discuss penalties relating to contracts, click [here](#).

Any contract, permit, or other transaction entered into by or with the city which results in or from a violation of any provision of sections 100 or 101 of this code is void, without further action taken, unless ratified by the city's legislative body in an open session held after applicable public notice. Such ratification does not affect the imposition of any penalties pursuant to this code or any other provision of law.

107. Penalties for Violation of This Code.

To discuss penalties and other relief, click [here](#).

To discuss negotiating with unions regarding penalties that apply to employees, click [here](#).

1. Resignation, Compensatory Action, Apology.

Violation of any provision of this code should raise conscientious questions for the **official or employee*** concerned as to whether a sincere apology, compensatory action, or resignation is appropriate to promote the best interests of the city and to prevent the cost - in time, money, and emotion - of an investigation and hearings.

Comment: An official should not compound ignoring a conflict of interest by again putting his or her personal interest ahead of the public interest by denying, obfuscating, or covering up what he or she knows to be true, or by, directly or indirectly, falsely accusing others of misconduct. An apology that includes sincere remorse and a willingness to make reasonable reparations restores respect and dignity, brings peace to personal and partisan rancor, assures the public that it is safe from further harm.

2. Disciplinary Action.

Any person or entity that is found to have engaged in action or inaction that violates any provision of this code may be reprimanded, suspended, or removed by the Ethics Commission, or the Ethics Commission may seek or impose any of the sanctions or remedies listed below or in **215**.

Comment: *Many cities do not choose to allow ethics commissions to suspend or remove officials and employees. This can be a special problem where the employee is covered by a collective bargaining agreement. Below is alternative language for such cities:*

Any person or entity that is found to have engaged in action or inaction that violates any provision of this code may be reprimanded by the Ethics Commission. If the Ethics Commission recommends that the violator be suspended or removed from office or employment, or be subject to any other sanction or remedy authorized by law or collective bargaining agreement not listed in this section or in **215**, the legislative body

must choose, in an open session held after applicable public notice, whether and to what extent to impose such sanctions.

Requiring the legislative body to make a determination on the ethics commission's recommendation is very important, because otherwise a council majority could prevent the matter from being debated (or they could dispose of it secretly in executive session). An alternative approach is to make it more clear what sort of violation of this code can lead to suspension or removal, and to require a supermajority, as in the following language:

The Ethics Commission may suspend or remove a respondent from office, or employ other sanctions or remedies authorized by law or collective bargaining agreement not listed in this section or in **215**. To suspend or remove a respondent, the violation must have been committed either with (i) fraudulent intent to secure the unjust enrichment of the respondent or another person or (ii) malicious intent to inflict pecuniary or other substantial injury upon another person. A respondent can be suspended or removed only by the vote of four members of the Ethics Commission.

Two important limitations on an ethics commission suspending or removing employees must be taken into account: (i) union rules and procedures; and (ii) civil service rules and procedures. Since these vary greatly, each city must determine how to take these into consideration without undermining the Ethics Commission's enforcement powers, especially with respect to elected and appointed officials who are neither union members nor civil service employees (and most ethics proceedings involve such officials). Protection of union and civil service prerogatives can be used a way to take enforcement power out of the Ethics Commission's hands. Please share your experiences with union and civil service conflicts with ethics enforcement.

When politicians do give this power to an Ethics Commission, especially one not of their choice, it makes a strong commitment to a neutral, non-politicized ethical environment and sends a clear message to people in the city government and to those who work with it.

Please also share your experiences with ethics commissions that do have the power to suspend or remove employees, as well as with situations where this power is reserved to the legislative body or other individuals or bodies.

3. Civil Fine.

Any person or entity that violates any provision of this code may be subject to a civil fine of up to \$2,000 for each violation, payable to the city. A civil fine may be imposed in addition to any other penalty authorized by this code or by law, other than a civil forfeiture pursuant to **subsection 5** of this section.

4. Damages.

Any person or entity that violates any provision of this code is liable in damages to the city for any losses or increased costs incurred by the city as a result of the violation. Such damages may be imposed in addition to any other penalty authorized by this code or by law, other than a civil forfeiture pursuant to **subsection 5** of this section.

5. Civil Forfeiture.

Any person or entity that violates any provision of this code is subject to a civil forfeiture to the city of a sum equal to twice the value of any **financial benefit*** he, she, or it

received, or caused others to receive, as a result of the conduct that constituted the violation. A civil forfeiture may be imposed in addition to any other penalty authorized by this code or by law, other than a civil fine pursuant to [subsection 3](#) or damages pursuant to [subsection 4](#) of this section.

108. Debarment.

To discuss penalties relating to contracts, click [here](#).

1. Any person or entity that intentionally or knowingly violates any provision of this code, in more than a de minimis manner, as well as any entity owned by such person or entity or by an owner of the entity in violation, is prohibited from entering into any contract, other than an employment contract, with the city for a period not to exceed three years.
2. Nothing in this section may be construed to prohibit any person or entity from receiving a service or benefit, or from using a facility, which is generally available to the public.
3. Under this section, a corporation, partnership, or other entity is not vicariously liable for the actions of an employee. A corporation, partnership, or other entity is not debarred because of the actions of an employee unless the employee acted in the execution of company policy or custom, or with knowledge of one or more company officers. A store, region, division, or other unit of an entity is not debarred because of the actions of an employee of that unit unless the employee acted at the direction, or with the actual knowledge or approval, of the manager of the unit.

109. Injunctive Relief.

To discuss penalties and other relief, click [here](#).

1. Any resident, official, or employee of the city may initiate an action or special proceeding, as appropriate, in a court of appropriate jurisdiction for injunctive relief to enjoin any person or entity from violating this code or to compel any person or entity to comply with the provisions of this code. In lieu of, or in addition to, injunctive relief, the action or special proceeding, as appropriate, may seek a declaratory judgment.
2. No action or special proceeding may be prosecuted or maintained pursuant to subsection 1 of this section, unless (a) the plaintiff or petitioner has filed with the Ethics Commission a complaint alleging the violation, (b) it is alleged in the complaint or petition filed with the court that at least six months have elapsed since the filing of the complaint with the Ethics Commission, and that the Ethics Commission has failed to issue a determination in the matter, and (c) the action or special proceeding is filed within ten months after the alleged violation occurred.

Comment: This section addresses the failure of the Ethics Commission to act on a matter before it. When the Ethics Commission does act within the period prescribed by subsection 2, the remedy of the aggrieved party (the complainant or the alleged violator) lies in a proceeding to review the commission's determination (see [216](#)). If the Ethics Commission files a determination in the matter after the 109 suit has been filed, the matter should proceed as a review proceeding, provided that the plaintiff or petitioner is aggrieved by the Ethics Commission's determination.

110. Whistle-Blower Protection.

To discuss this section, click [here](#).

1. Neither the city nor any person, including **officials and employees***, may take or threaten to take, directly or indirectly, official or personal action, including but not limited to discharge, discipline, personal attack, harassment, intimidation, or change in job, salary, or responsibilities, against any official, employee, or other person (or against any member of their family) because that person, or a person acting on his or her behalf, (a) reports, verbally or in writing, or files a complaint with the Ethics Commission regarding an alleged violation of this code, or (b) is requested by the Ethics Commission to participate in an investigation, hearing, or inquiry, or is involved in a court action relating either to the alleged violation or to evidence presented or given as part of an Ethics Commission investigation or hearing. The provisions of this section are not applicable when the complainant, witness, or reporter of a violation made accusations or other statements that were malicious and false. A violation of this section is a violation of this code.

2. Anyone who alleges a violation of subsection 1 may bring a civil action for appropriate injunctive relief, or actual damages, or both within ninety days after the occurrence of the alleged violation. A court may order reinstatement of the plaintiff to such a suit, or the payment of back wages, full reinstatement of fringe benefits and seniority rights, actual damages, or any combination of these remedies. A court may also award the plaintiff all or a portion of the costs of litigation, including reasonable attorney fees and witness fees. The initiation of such litigation is not a violation of the confidentiality provisions in **100(8)** or **213(9)**.

Comment: Without whistle-blower protection, city employees - the people who best know what is going on in the city government - will be unlikely to come forward with reports of ethics code violations. It is difficult enough to betray the strong feelings of loyalty that exist in most workplaces, and almost impossible when speaking out endangers your job and pension. With whistle-blower protection, city officials will know their violations might be reported and, therefore, will be more likely to act consistent with the code (that is, their personal interest in protecting themselves will be closer to the public interest in their acting fairly and impartially).

111. Definitions.

To discuss this section, click [here](#).

To discuss whether some provisions should apply only to certain officials, click [here](#).

Unless otherwise stated or unless the context otherwise requires, when used in this code:

1. To **"appear"** or "appear before" means to communicate in any form, including, without limitation, personally, through another person, by letter, or by telephone. This definition also applies to the noun form, "appearance."

2. **"Consultant"** means an independent contractor or professional person or entity engaged by the city or advising a city official, and in a position to influence a city decision or action, or have access to confidential information.

3. "Customer or client" in 100(1)(e) means (a) any person or entity to which a person or entity has supplied goods or services during the previous twenty-four months, having, in the aggregate, a value greater than \$1,000, or (b) any person or entity to which an official or employee's* outside employer or business* has supplied goods or services during the previous twenty-four months, having, in the aggregate, a value greater than \$1,000, but only if the official or employee knows or has reason to know the outside employer or business supplied the goods or services.

4. "Domestic partner" is an adult, unrelated by blood, with whom an unmarried or separated official or employee* has an exclusive committed relationship, maintains a mutual residence, and shares basic living expenses.

5. "Financial benefit" includes any money, service, license, permit, contract, authorization, loan, discount, travel, entertainment, hospitality, gratuity, or any promise of any of these, or anything else of value. This term does not include campaign contributions authorized by law. A "financial interest" is a relationship to something such that a direct or indirect financial benefit has been, will be, or might be received as a result of it.

6. A "gift" is a financial benefit* received or given without equivalent compensation. However, a financial benefit* received or given on terms available to the general public is not a gift.

7. "Household" includes anyone whose primary residence is in the official or employee*'s home, including non-relatives* who are not rent payers or servants.

8. An "interest in a contract" is a relationship to a contract such that a direct or indirect financial or other material benefit* has been, will be, or might be received as a result of that contract. The official or employee* does not need to be a party to the contract to have an interest in it. Indirect benefit includes a benefit to the official's family or outside business or employer.

9. "Ministerial act" means an action performed in a prescribed manner without the exercise of judgment or discretion as to the propriety of the act. An example of a ministerial act is the granting of a marriage license by a city clerk.

10. "Official or employee" means any official or employee of the city, whether paid or unpaid, and includes all members of an office, board, body, advisory board, council, commission, agency, department, district, administration, division, bureau, committee, or subcommittee of the city. The term also includes candidates for office and elected candidates prior to the time they take office, as well as anyone engaged in the performance of a governmental function. "Official or employee" does not include:

(a) A judge, justice, or official or employee of the court system;

(b) A volunteer fire fighter or civil defense volunteer, except a fire chief or assistant fire chief; or

11. "Outside employer or business" includes:

(a) any substantial business activity other than service to the city;

(b) any entity, other than the city, of which the official or employee* is a member, official, director, or employee, and from which he or she receives compensation for services rendered or goods sold or produced;

(c) any entity located in the city or which does business with the city, in which the official or employee* has an ownership interest, except a public corporation in which the official

or employee's ownership interest is the lesser of (i) stock valued at less than \$50,000 or (ii) five percent of the outstanding stock; and

(d) any entity to which the **official or employee*** owes, or by which the official or employee is owed, more than \$10,000, either in the form of a note, a bond, a loan, or any other financial instrument.

For purposes of this definition, "compensation" does not include reimbursement for necessary expenses, including travel expenses..

12. "Personal benefit" includes benefits other than those that are directly financially advantageous. These include **financial benefits*** to **relatives***, business associates, and others listed in **100(1)**, as well as non-financial benefits to these people and to oneself, including such things as reputation and the success of one's career. A "personal interest" means a relationship to something such that a personal benefit has been, will be, or might be obtained by certain action or inaction with respect to it.

13. "Relative" means a spouse, child, step-child, brother, sister, parent or step-parent, or a person claimed as a dependent on the **official or employee's*** latest individual state income tax return.

14. "Subordinate" means another **official or employee*** over whose activities an official or employee has direction, supervision. or control.

Comment: Subsection 3 ("customer or client"): An employee of a large corporation may not know many of the customers or clients of his or her employer and should not be penalized for that understandable ignorance. For that reason, the "knows or has reason to know" language is included.

Subsection 6 ("gift"): A "financial transaction -- on terms not available to the general public" includes, for example, a reduced-interest loan to a municipal official. The reduction in interest would constitute a gift.

Subsection 10 ("official or employee") used to contain an exception for members of advisory boards that have no authority to implement their recommendations. This exception was deleted for the reasons set forth in **a blog post**, which focuses on more responsible ways of dealing with conflicted potential advisory board members.

Subsection 11(c)("outside employer or business"): It is sometimes said that stock ownership in a public company is not relevant to an official's interests, because he or she owns a tiny percentage of the stock and therefore has no control over the entity. But the success of the public company does have special meaning to someone who holds a large dollar amount of that company's stock (even if that amount is large only for the individual, not for the corporation) and, therefore, it does constitute an interest that could get in the way of an official's ability to act impartially (as well as the perception of how the official would benefit from the company's success).

The amount of share holdings will not be disclosed, but since there is a minimum amount, it will be clear that any disclosed share holding is sizeable. Therefore, some cities may want a lower threshold amount, so that it is not clear whether a shareholding is large or small.

Subsection 12 ("personal benefit"): Many ethics codes require the expenditure of funds even with respect to personal benefits. But this requirement allows officials to vote, say, on whether they should have to withdraw from participation, when a committee member raises the issue at a meeting. Non-financial interests, such as reputation, are very important to people and have an equally powerful effect on their ability to make impartial

decisions. *I would like to hear about examples of personal benefits you feel should be included as giving rise to a possible conflict of interest, and how you have seen such personal benefits dealt with when they are and when they are not covered by ethics codes.*

Subsection 13: Some cities follow the IMLA Model Code by defining "relatives," generally or in such instances as gift-giving, as anyone within up to the fifth degree of consanguinity. I feel that this term is inappropriate to an ethics code because of its unfamiliarity, its difficulty, and its common usage in law (determining incest). To be in the fifth degree of consanguinity, two individual's first common ancestor must be no more than a total of five generations away. For example, if my grandfather (two degrees) is your great-grandfather (three degrees), there are five degrees of consanguinity between us. In law, because consanguinity is for the purpose of defining incest, it does not include relationship by marriage. However, relationship by marriage is relevant in government ethics.

Throughout this code there are stars next to defined words. If this usage is followed and the code is placed on a city's website, these stars should be turned into links to the Definitions section, so that the definitions can be easily consulted.

Part B: Administrative Provisions

201. Duties of City Clerk.

The City Clerk must maintain on file for public inspection and, with respect to disclosure statements, index in alphabetical order by the last name of the relevant official, employee, candidate, or applicant the following documents:

- (1) A copy of the code of ethics and amendments thereto;
- (2) A statement that the city has established an Ethics Commission, and its composition;
- (3) A copy of the form of annual statement of financial disclosure;
- (4) A list of the names and offices, or positions, of all officials and employees required to file annual disclosure statements;
- (5) Copies of all transactional, applicant, and annual disclosure statements filed pursuant to this code.

202 Maintenance of Disclosure Statements.

1. The City Clerk must transmit promptly to the Ethics Commission copies of each transactional and applicant disclosure statement filed pursuant to sections 101, 103, and 104 of this code.
2. The Ethics Commission must index and maintain on file for at least seven years all disclosure statements filed with it pursuant to sections 101, 103, and 104 of this code..

203 Ethics Commission: Establishment; Qualifications of Members; Appointment of Members; Term of Office.

To discuss the establishment and role of ethics commissions, click [here](#).

1. There is hereby established an Ethics Commission consisting of five members, plus two alternate members. All members and alternate members must be residents of the city.

2. No member of the Ethics Commission may be, or have been within the three years prior to appointment, an **official or employee***, consultant or contractor of the city; an officer in a political party or political committee; a candidate or an active member of the campaign of a candidate for any office within the Commission's jurisdiction; or a lobbyist. Nor should a member nor any member of his or her immediate family, have, within the three years prior to appointment, sought any special benefits from the city, directly or indirectly. An Ethics Commission member or staff member, or a member of his or her immediate family, may not, directly or indirectly, seek any special benefits from the city, make campaign contributions, nor participate in any way in the campaign of a candidate for any office within the commission's jurisdiction, or of an individual currently within the commission's jurisdiction.

3. Of the regular membership of the Board, no more than two may be registered in the same political party, and at least one must be registered as unaffiliated. The alternate members may not be registered in the same political party.

4. Within sixty days after the effective date of this code, and no later than December 31 each year thereafter, the city's legislative body will appoint the members of the Ethics Commission from a list of nominees prepared by [five-to-seven community organizations, such as the local branch of the League of Women Voters; see **this City Ethics blog post** to see how some local governments do this.]

Comment: *Subsection 1: Five is not a magic number for an ethics commission. In large cities, if there is a lot of activity, it would be best to have a larger number of members, and then allow, say, five-member panels for proceedings, and three-member panels for advisory opinions. When there is little activity, it is often difficult to get a quorum at ethics commission meetings, so it is best to keep the number of members low. This is especially important since an ethics commission may only act by the majority vote of its total membership, not just those members who attend a meeting.*

Subsection 2: There are constitutional problems with excluding elected officials from ethics commissions, but it is a terrible idea to have an elected or appointed official on a commission that is supposed to be independent and without its own conflicts of interest. It undermines the spirit of the ethics code.

The restriction on municipal officials and employees, and lobbyists and party officers, serving on ethics commissions seeks to ensure that the board is as free as possible from pressure from other officials, co-workers and superiors alike.

Subsection 3: The restriction on the political make-up of the board aims to strengthen both the perception and the reality of a board that is not partisan. Ethics commissions must not become political footballs, because this will undermine trust in them and cause people not to file complaints or seek advisory opinions, nor to have faith in their determinations. For the same reason, this code restricts the political activities of ethics commission members.

Subsection 4: The idea of having one or more nonpartisan civic organizations select a city's ethics commission is unusual, but there are no better alternatives to preventing an ethics commission from being (and appearing) political or to ensuring that either party cannot block a member of its party from being disciplined or from getting no more than a reprimand. Another alternative is to require that each member be selected by unanimous vote of the legislative body, but this would still allow the parties to trade votes and make the same selections the two party committees would have made (or in

fact did make). An ethics commission should be as nonpartisan, and without its own conflicts, as possible, and answerable to no one. Only a nonpartisan body can ensure this, at least on a city level (that is, without having a regional or state commission handle city ethics matters; see the next comment for more on this). In any event, instead of politicians (or even nonpartisan civic organizations) selecting only people they know, a vacancy on an ethics commission should be widely publicized, and citizens who are not politically involved should be encouraged to apply.

Smaller municipalities may choose to form joint or regional ethics commissions. Since, in towns, most politically active residents have personal biases and relationships with those most likely to be brought before an ethics commission, a regional ethics commission can provide a truly neutral, independent solution. The decisions of a regional ethics commission will demand much more respect and make people more certain that ethical matters are not being decided based on local loyalties. In addition, towns lack the resources to educate ethics commission members pursuant to 211, and they have too few matters brought before them to allow members to gain the necessary experience. Another alternative, which several states employ, is to have a state ethics commission deal with municipal as well as state matters (the commission can be the same one, or a separate one that focuses on municipal matters, but has access to the same staff expertise). I would like to hear people's feelings about regional and state ethics commissions, as well as their experiences with them.

5. The term of office of Ethics Commission members is three years and runs from January 1 through December 31, except that, of the regular members first appointed, one member will serve until December 31 of the year in which the Board is established, two regular members and one alternate member will serve until the second December 31, and two regular members and one alternate member will serve until the third December 31.

6. An Ethics Commission member will serve until his or her successor has been appointed, in the same manner as the original appointments. Consecutive service on the Ethics Commission may not exceed two full terms, except that a one-term alternate member may thereafter serve two terms as a regular member, and a two-term alternate member may thereafter serve one term as a regular member.

7. Members of the Ethics Commission will not receive compensation but will be reimbursed for reasonable expenses incurred in the performance of their official duties.

8. The unexcused absence of any member from three consecutive meetings, unless the Ethics Commission has excused the absence for good and sufficient reason, shall constitute a resignation.

Comment: Subsection 5: The terms of office of members should be staggered, to provide continuity in the work and philosophy of the board. Municipalities may wish to increase or decrease the length of the term of office or establish a different year of service than the calendar year. However, terms of office should be sufficiently long to ensure that the members acquire expertise, but not so long as to discourage people from serving on the commission. In addition, ethics commission members should not be allowed to become entrenched on the commission; the model law therefore contains a term limitation. However, interested, experienced members may return to the commission after a term off.

204. Ethics Commission: Vacancies.

To discuss the establishment and role of ethics commissions, click [here](#).

When a vacancy occurs in the membership of the Ethics Commission, the vacancy will, within sixty days, be filled for the unexpired portion of the term in the same manner as regular appointments. Any person appointed to fill a vacancy on the Ethics Commission must meet the qualifications and limitations set forth in [203](#) of this code.

205. Ethics Commission: Removal of Members.

To discuss the establishment and role of ethics commissions, click [here](#).

An Ethics Commission member may be removed from office by at least a three-fourths majority of the legislative body, after written notice, including a clear statement of the grounds for removal, and opportunity for reply, at least thirty days before voting on removal. The only grounds for removal are failure to meet the qualifications or limitations set forth in [203](#) of this code, substantial neglect of duty, gross misconduct in office, inability to discharge the powers or duties of office, and violation of this code.

Comment: The party in power cannot be allowed to change the membership of the ethics commission when a colleague comes before it. This does happen, and it can be very damaging to a city's trust in its government. It is preferable that it be made very difficult to get rid of ethics commission members. Please share experiences with the removal or attempted removal of ethics commission members.

206. Ethics Commission: Meetings.

To discuss the establishment and role of ethics commissions, click [here](#).

At its first meeting each calendar year, the Ethics Commission will elect a chair and a vice-chair from among its regular members; alternate members may vote for chair and vice-chair. A majority of the regular members is required for the Commission to take any action. The chair or a majority of the regular members may call a meeting of the Commission.

207. Ethics Commission: Jurisdiction, Powers, and Duties.

To discuss this and the following sections on ethics commission powers and duties, click [here](#).

1. The Ethics Commission may only act with respect to current and former [officials and employees*](#) (and those who, although acting under contract, appear to act as government officials and employees), [consultants*](#), applicants, candidates, and persons and entities that do or seek business with the city (including the owners and officers of such entities, and subcontractors and other indirect beneficiaries), are required to make applicant disclosures, give [gifts*](#) to [officials and employees*](#) or their [relatives*](#), induce, encourage, or aid anyone to violate any provision of this code, or are otherwise covered by the provisions of this code.

2. The termination of an official's or employee's term of office or employment with the city does not affect the jurisdiction of the Ethics Commission with respect to the requirements imposed on him or her by this code.

Comment: Jurisdiction over former officials and employees, as well as over those who do business with the city or give gifts, can be controversial. The extent of jurisdiction allowed by courts (when they have had to decide this issue) varies among states, but

often it is unclear, and many lawyers, especially those involved politically, will automatically say that there is no such jurisdiction. Nothing makes government officials and employees feel more secure than knowing all they have to do is quit in order to prevent an ethics or corruption matter from being investigated. Therefore, it is important to make it clear in advance to officials and employees that quitting is not an antidote to ethics violations. I would like to hear about the law in various states, and experiences people have had or know about where jurisdiction has been successfully or unsuccessfully challenged, and the effects of such challenges on ethics systems.

3. Unless otherwise stated, all Ethics Commission decisions or determinations must be made by the affirmative vote of a majority of members present.

4. The Ethics Commission has the following powers and duties:

(a) To solely prescribe and promulgate rules and regulations governing its own internal organization and procedures in a manner consistent with this code;

(b) To appoint hearing officials, an executive director, if necessary, and such other staff as are necessary to carry out its duties under this code, and to delegate authority to the executive director, if any, to act in the name of the Commission between meetings of the Commission, provided that the delegation is in writing and the specific powers to be delegated are enumerated, and further provided that the Commission may not delegate the power to render a formal advisory opinion, determine a violation, impose a penalty, seek any remedy not otherwise delegated in this code to the legislative body, or refer a matter to a prosecutor. An executive director must meet the qualifications of an Ethics Commission member as specified in [203](#) of this code;

(c) To prepare and provide forms for complaints and for annual, applicant, and transactional disclosure statements, pursuant to [section 208](#);

(d) To review, index, and maintain on file disclosure statements filed with the Commission, pursuant to [sections 202 and 208](#) of this code;

(e) To render, index, and maintain on file advisory opinions pursuant to [section 209](#);

(f) To review, index, maintain on file, and dispose of complaints, and to make notifications and conduct investigations pursuant to [section 213](#);

(g) To conduct hearings, apply and recommend disciplinary action, assess penalties, make referrals, and initiate appropriate actions and proceedings pursuant to [sections 214 and 215](#);

(h) To dispose of waiver requests pursuant to [section 210](#);

(i) To provide training and education to officials, employees, and those doing business with the city pursuant to [section 211](#);

(j) To prepare an annual report and recommend changes to this code pursuant to [section 212](#);

(k) To provide for public inspection of certain records pursuant to [section 217](#); and

(l) To make this code and explanations of it available for reproduction and distribution pursuant to [section 219](#).

Comment: Subsection 4: This model code is intended to minimize the administrative burden on municipalities. For that reason, only sizeable cities will find it necessary to hire an executive director and staff for their ethics commissions. In such instances, the code should specify the powers and duties of the executive director, for example, carrying out investigations or overseeing ethics officers. All other municipalities can rely

upon other municipal staff members for the occasional secretarial services or legal advice the enforcement of the law will require.

However, care must be taken that any municipal staff used by the ethics commission maintain the confidentiality of commission actions and remain free from conflicts of interest and political and other pressures from superiors and peers. In particular, where the city attorney is a political appointee or is otherwise beholden to the chief elective official or a majority of the governing body, the commission must have the authority, when necessary, to obtain independent counsel. For that reason, some municipalities may wish to require, in their ethics code, funding for such counsel.

This raises the general issue of funding. One of the most popular ways to prevent an ethics commission from doing too good a job investigating alleged violations of the ethics code is to restrict its budget. With a small budget, it will be forced to depend on the city attorney and will have to cut corners and delay investigations. If it is possible, a city seeking to improve its ethical environment should set a healthy budget for the next few years, with minimum increases tied to inflation.

5. Ex Parte Communications

(a). An Ethics Commission member may not communicate, directly or indirectly, with any party to an ethics proceeding or with any person who has a direct or indirect interest in the outcome of an ethics proceeding (other than communications necessary to procedural aspects of maintaining an orderly process, including settlement negotiations) without notice and opportunity for all parties to participate. Such communications constitute ex parte communications.

(b). It is an ethics violation for anyone to make, or attempt to make, directly or indirectly, an ex parte communication to an Ethics Commission member.

(c). An Ethics Commission member who receives an ex parte communication must place on the record of the matter all written communications received, all written responses to the communications, and a memorandum stating the substance of all oral communications received, all responses made, and the identity of each person from whom the member received, directly or indirectly, an ex parte communication. The member must advise all parties that these documents and information have been placed on the record.

(d). Within fourteen days after receiving notice of an ex parte communication, any party, or other person mentioned, may place a written rebuttal statement on the record.

(e). If, before an ethics proceeding, an Ethics Commission member receives an ex parte communication that could not properly be received during the proceeding, the member must disclose the communication to the Commission and, when the proceeding commences, the documents and memo must be placed on the record of the proceeding, as set forth in subparagraph (c).

(f). If necessary, to eliminate the effect of an ex parte communication, an Ethics Commission member who receives the communication may be asked by the Commission to withdraw. However, the Commission should not allow a party to a proceeding, or other interested person, to use an ex parte communication to remove a member from an active role in a proceeding.

Comment: *Restricting ex parte communications can make the ethics process slower and more difficult for everyone. But it is important that officials not be permitted to use their offices to influence an Ethics Commission's members. Even the appearance of*

manipulation is disastrous to an ethics program. In larger jurisdictions, where there is more than one staff member, and a separation of prosecutorial and advisory functions, an ex parte communication provision should be extended to staff performing a prosecutorial function with respect to any particular proceeding.

208. Lists, Complaint Forms, and Disclosure Statements.

To discuss this and the previous sections on ethics commission powers and duties, click [here](#).

1. The Ethics Commission will annually review the list of **officials and employees** required to file annual disclosure statements, to determine whether the lists are complete and accurate. Within ninety days after it has been formed, and by February 1 each year thereafter, the Ethics Commission must (a) cause to be filed with the City Clerk a list of the names and offices, or positions, of all officials and employees* and others required to file annual disclosure statements pursuant to **103** of this code; and (b) notify all such persons of their obligation to file an annual disclosure statement.
2. The Ethics Commission will prepare forms for complaints and for annual, applicant, and transactional disclosure statements, and will make these forms available at the City Clerk's office and on the city's website, for easy downloading.
3. By June 15 of each year, the Ethics Commission must review all annual disclosure statements filed with it to determine whether any person required to file such a statement has failed to file it, has filed a deficient statement, or has filed a statement that reveals a possible or potential violation of this code.
4. The Ethics Commission must review all transactional disclosure statements filed with it.
5. If the Commission determines that an annual or transactional disclosure statement is deficient or reveals a possible or potential violation of this code, the Commission will notify the person in writing of the deficiency or possible or potential violation, and of the penalties for failure to comply with this code.

209. Advisory Opinions.

To discuss advisory opinions, click [here](#).

1. Upon the written request of any **official or employee,*** including former officials and employees who served or were employed within the prior three years, and also including those who intend to soon become an official or employee, as well as any candidate, **consultant**, or person or entity doing business with the city or seeking a special benefit from the city, or intending to soon do so, the Ethics Commission must render, within fifteen days after the date of its next regular meeting, a written advisory opinion with respect to the interpretation or application of this Code with respect to future actions only. If an earlier response is desired, or if the Ethics Officer determines that the situation does not require a formal advisory opinion, a verbal, mailed, or e-mailed opinion will be provided by the Ethics Officer.
2. Any person or entity may request informal, verbal advice from the Ethics Officer about any situation, including hypothetical situations, but such advice is not binding and there are no time requirements.

3. The Ethics Commission will designate one of its members or alternate members, or another individual selected by the votes of at least four sitting members, to be the Ethics Officer, for the purpose of quickly responding to questions regarding the requirements of this Code. The Ethics Officer's phone number and e-mail address will be made available on the Commission's website. The Ethics Officer's informal opinions may be relied upon, in good faith, but will not be binding upon the Commission or upon the person making the request.

4. An advisory opinion rendered by the Ethics Officer or the Ethics Commission, until and unless amended or revoked, is binding upon the Ethics Commission in any subsequent proceeding concerning the person or entity that requested the opinion, or to which the advisory opinion referred, and acted in good faith, unless the requester omitted or misstated a material fact in requesting the advisory opinion. The advisory opinion may also be used as a defense in any civil action brought by the Ethics Commission or the city.

5. A written advisory opinion is also binding on an official, employee, candidate, contractor or other person under the Ethics Commission's jurisdiction to whom it directly applies. If the Ethics Commission has reason to believe that a written advisory opinion has not been complied with, it will take appropriate action to ensure compliance, including but not limited to the filing of a complaint pursuant to 213(3).

6. Advisory opinions (with unnecessary financial and personal details redacted) will be indexed and maintained on file by the Ethics Commission and will also be available on the city website. Officials, employees, and businesses should be notified about advisory opinions that directly affect their conduct.

7. A requester of ethics advice may seek reconsideration of a written advisory opinion by the Ethics Officer or the Ethics Commission. A request for reconsideration must allege that (1) a material error of law has been made; (2) a material error of fact has been made; or (3) a change in materially relevant facts or law has occurred since the request for ethics advice was made. The Ethics Officer's decision upon reconsideration may be appealed to the Ethics Commission. An Ethics Commission's decision upon reconsideration is final and may not be appealed. The Ethics Officer or Ethics Commission may reconsider its advice on its own initiative, providing notice to whoever originally requested the advice and to any official, employee, or other person under the Ethics Commission's jurisdiction that will be directly impacted by the advice. Advice stands until it has been amended; it is not suspended pending reconsideration or appeal.

Comment: *This is the Ethics Commission's most important responsibility. It is very important for local government officials and employees, whenever they are uncertain as to whether they should proceed with a matter, to immediately seek advice. This will prevent unethical conduct from occurring due to a lack of knowledge or understanding, and will create a series of precedents to guide officials and employees in the future.*

In smaller jurisdictions that do not provide for paid staff, ethics officers sometimes work on a volunteer or part-time basis (and ethics officers can be shared among small jurisdictions). They can be very helpful in providing quick advice before possible conflicts can cause problems. Ethics Commissions rarely meet often enough to provide timely advice, and town, city, and county attorneys rarely have the training, and rarely are unbiased enough, or seen as unbiased enough, to provide trustworthy advice.

There is nothing worse than having an official told by a government attorney that he or she can do (or not do) something which, whether a violation of the ethics code or not, would undermine citizens' trust in their government officials. And yet this happens all the time. A truly neutral ethics officer can prevent this from happening.

Although it is common for informal ethics advice not to be binding on the ethics commission and not to require an official to follow it, if the informal ethics advice is put into writing, and the facts are confirmed by the requester, it is best to treat the informal ethics advice as binding on both the requester and the ethics commission.

The reference to civil actions in subsection 3 refers to actions for damages, civil forfeiture, debarment, or injunctive relief.

Subsection 5: Here, cities might want to reference specific privacy laws or laws regarding public records, or refer more generally to such laws.

210. Waivers.

To discuss waivers and exclusions, click [here](#).

1. Upon written application and upon a showing of compelling need by the applicant, at an open session after public notice, the Ethics Commission may in exceptional circumstances grant the applicant a waiver of subsections **1-10, 1-11, 13-19, 21** of 100, **101(1)(a), 106**, or **108** of this code. To allow a waiver, the Ethics Commission must determine either that the applicant has a compelling need or that overall, when considering the possible damage to the community, the conduct would clearly be beneficial to the community. The Ethics Commission must also determine the extent to which the waiver might create a potential for undue influence, unfair advantage, or a serious appearance of impropriety.

2. Waivers must be in writing and must state the grounds upon which they are granted. Within ten days after granting a waiver, the Ethics Commission must publish the waiver on its website in a clearly designated area..

Comment: *A provision for waivers of ethics provisions is dangerous because it opens the door to the wholesale gutting of an ethics code, encourages political pressure on ethics commissions by individuals and groups within the community, and leads to charges of partiality, all of which undercut the perception of the ethics commission as an impartial body of high integrity. For those reasons, many municipalities may wish to forego a provision for waivers. Other municipalities, concerned about the need to remedy unnecessary hardship that ethics provisions may impose upon an individual in a particular instance, will wish to run these risks.*

To minimize the risks, this section sets a high standard for granting a waiver ("compelling need" and "exceptional circumstances"), restricts waivers to certain specified provisions, and requires that the waiver be published. Moreover, the meeting of the ethics commission at which the waiver is considered must be held in open session after public notice.

Some cities may want to list criteria for providing waivers. For example, here are the criteria that Baltimore considers sufficient (one of either (1)-(4) plus (5)):

- (1) the action would constitute an unreasonable invasion of privacy;
- (2) compliance would constitute a hardship;
- (3) the nature of the activities of the person, agency, board, or commission does not require compliance;

(4) compliance would significantly reduce the availability of qualified people for public service;

(5) the particular exemption would not be contrary to the purposes of this article.

Some cities may want to list possible reasons for waivers as a guide for both officials and the ethics commission. For example, here are Denver's sample waivers for nepotism:

(1) The relative who was proposed to be hired was certified through a competitive process conducted pursuant to law, and the officer, official, or employee who would make the appointment did not influence or affect the certification.

(2) The officer, official, or employee who would officially make the appointment is acting ministerially and did not select the relative or attempt to influence the person who did.

(3) The relative who would be in the line of supervision was already working in the agency before the officer, official, or employee came into the line of supervision, and the officer, official, or employee can and will abstain from participating in any personnel actions involving the relative.

And then there are exemptions. Some codes include a number of exemptions, providing an alternative list of provisions that show what is acceptable, as opposed to what constitutes a violation. These exemptions have been omitted from this model code, because I feel they are self-evident and because, although they are self-evident, they can be used as defenses by respondents who can say they misconstrued their conduct as falling within one of the exemptions. For example, as I said above, the standard of interference with discharge of duties is too ambiguous a criterion; when it is applied in the negative sense (as in (b) below) - that there is no conflict of interest where there is no such interference - it is easy to argue that there was no such interference. Here is what the IMLA Model Code lists as exemptions:

(a) No provision of this Ordinance shall be construed to prohibit or restrict any City employee from negotiating, entering into or enforcing a collective bargaining agreement between the City and a labor union to which the employee belongs pursuant to state or federal law. No public servant shall be deemed to have a conflict of interest due to any lawful action taken pursuant to a collective bargaining agreement. The mere fact that public servants have entered into a collective bargaining agreement, however, shall not exempt them from any provision of this Ordinance unless the City is barred by the collective bargaining agreement from adopting the provision in question.

(b) This Ordinance does not prevent any public servant from accepting other employment or following any pursuit which in no way interferes with the full and faithful discharge of his or her public duties, provided that the public servant complies with all applicable City requirements, including any requirements imposed by this Ordinance.

(c) No public servant shall be deemed to have a conflict of interest by virtue of carrying out any contract pursuant to which the public servant directly or indirectly received income or benefits in the form of compensation for the performance of official duties.

(d) A former public servant is not prohibited from entering into a contract to represent the City in any matter.

(e) No public servant shall be deemed to have a conflict of interest by virtue of sharing, directly or indirectly, in the benefit of a lawful City action when the benefit to the public servant is substantially the same as the benefit to the public at large or to a segment of the public to whom the benefit is provided in a nondiscriminatory manner.

(f) This Ordinance does not prohibit any public servant from taking any action to approve the lawful payment of salaries, employee benefits, reimbursements of actual and necessary expenses, or other lawful payments which are authorized in accordance with City policies.

(g) This Ordinance does not prohibit public servants from taking any official action properly within the scope of their duties with respect to any proposal to enact or modify law or public policy.

(h) This Ordinance does not prohibit an elected official from raising campaign contributions in any manner which is otherwise permitted by law.

(i) This Ordinance does not prohibit communication between an individual or organization and a candidate regarding the candidate's views, record or plans for future action regarding an issue or measure in an attempt to determine a candidate's viewpoints or how the candidate plans to act in the future, if such communication results in an endorsement of the candidate, a decision not to endorse the candidate, or a contribution or expenditure required to be recorded or reported under a state statute.

(j) Actions which might otherwise be alleged to constitute a conflict of interest shall be deemed to comply with this Ordinance and not to be a conflict of interest if:

(1) before acting, the public servant requested and received a written opinion from the City Attorney or a formal ethics opinion or a confidential advisory opinion from the Board in accordance with the procedures established in this Ordinance; and

(2) the material facts, as stated in the request for an opinion, are true and complete; and

(3) the actions taken were consistent with the opinion.

211. Training and Education.

To discuss this section, click [here](#).

The Ethics Commission (1) will, within one year after its passage, make this code, and explanations of its provisions (including information on how to fill out all forms and statements), available (including, but not limited to, on the city website) to all **officials and employees**, candidates and **consultants***, and to municipal residents and to all persons doing business or interested in doing business with the city, and (2) will develop educational materials and a required educational program for the officials and employees of the city, and those who do business with the city, regarding the provisions of this code. The educational program must begin within eighteen months after this code goes into effect. In addition, the Ethics Commission will hold an annual workshop for new and old officials and employees to discuss this code, its values and goals, its enforcement, and the ways in which it has affected their work and the working of the city government.

212 Annual Reports; Review of Ethics Laws.

To discuss this section, click [here](#).

1. The Ethics Commission must prepare and submit an annual report to the legislative body, summarizing the activities, decisions, and advisory opinions of the Commission. The report may also recommend changes to the text or administration of this code. The report must be submitted no later than October 31 of each year, covering to the year

ended August 31, and must be filed with the City Clerk and made available on the city website.

2. The Ethics Commission will periodically (no less than every five years) review this code, the enforcement of the code, and the Commission's rules, regulations, and administrative procedures to determine whether they promote integrity, public confidence, and participation in city government, and whether they set forth clear and enforceable, common-sense standards of conduct. After at least one public hearing, it may recommend to the legislative body amendments to this code.

213. Filing a Complaint; Investigations.

To discuss this section, click [here](#).

1. Upon receipt of a complaint on a form prepared by the Ethics Commission pursuant to **208(2)**, which any person or entity may file, the Ethics Commission will first determine if it, in fact, alleges an action or inaction that, if the allegations are true, might constitute a violation of this code, and that at least one person or entity accused of a violation is covered by this code. If the Ethics Commission determines that no such action or inaction has been alleged or that no one accused is covered by this code, then it will dismiss the complaint with notice to the complainant. Similarly, if the Ethics Commission determines that an alleged violation is so minor that it is not worthy of investigation, then it will dismiss the complaint with notice to the complainant. The Ethics Commission must make this determination within thirty days of receipt of a complaint.

Comment: *It is common to require complainants to swear to their allegations, and some ethics codes contain penalties for those who make knowingly false accusations in their complaints. But this makes it hard for individuals and, especially, entities to file complaints, because they often are not certain as to the facts of a matter. They have only done limited investigation. But they believe they have enough information to seek an investigation by the ethics commission. Even with whistle-blower protection, city employees - the people who know best what is happening in the city - are afraid to come forward or get involved in controversial, protracted proceedings. Officials often depend on this reluctance when they act unethically. Allowing hotline tips does not require changing this subsection, because the final complaint would be filed by the ethics commission.*

Most ethics codes limit complaints to individuals, but this model code allows entities to file as well. This is especially intended to allow civic organizations and citizens groups to file complaints, because there are many instances where an individual's filing leads to slap suits and other forms of harassment from wealthy respondents. The threat of suit is one of the most serious obstacles to the workings of an ethics system.

For more about minor or de minimis violations, see the [City Ethics blog post](#) on this topic.

2. A complaint must be filed within one year after the complainant discovered the alleged violation. Complaints may be filed against **officials and employees*** who no longer hold office or are no longer employed.

3. The Ethics Commission may, on its own initiative, determine through an inquiry into informal allegations or information provided directly to the Commission, through the hotline, by referral, in the public news media, or otherwise that a violation of this code may exist, and prepare a complaint of its own. The Ethics Commission may also amend

a complaint that has been filed with it by adding further allegations, by adding respondents involved in the same conduct, directly or indirectly, by action or inaction, or by deleting allegations that would not constitute a violation of this code, have been made against persons or entities not covered by this code, or do not appear to be supported by the facts. The Ethics Commission may also consolidate complaints where the allegations are materially related.

4. The Ethics Commission must send notification of the accepted or self-initiated complaint, as amended, as well as any further amendment, to the respondent against whom the complaint was filed, not later than seven days after making the determination in subsection 1 or the preparation of a complaint or amendment pursuant to subsection 3. A copy of the complaint, and of any amendments, must accompany such notice. The Ethics Commission must also send notification to the complainant in writing of its receipt and acceptance of the complaint, and of any amendments. Here and elsewhere, "complainant" and "respondent" might consist of more than one person or entity.

5. Settlement Agreements

a. At any time after a complaint has been filed, the Ethics Commission may seek and enter into a settlement agreement with the respondent. At any time after a complaint has been filed, the Ethics Commission may seek and enter into a settlement agreement with the respondent. The settlement agreement will include the nature of the complaint, findings of fact, conclusions of law, the Commission's reasons for entering into the agreement, an admission of violation by the respondent, and a waiver of the right to a hearing and to appeal. It will also, where relevant, include a promise by respondent not to do certain actions, the imposition of penalties permitted by this code, remedial action to be taken, and oral or written statements to be made.

b. In determining whether a matter is appropriate for settlement, the Ethics Commission should consider the following factors, as well as other factors it considers relevant: (i) the severity of the alleged conduct; (ii) the respondent's apparent level of knowledge and willfulness regarding the alleged conduct; (iii) whether the alleged conduct appears to be an isolated event or part of a pattern of conduct; (iv) whether the alleged conduct appears to indicate violations of criminal laws; (v) the complexity of issues or evidence, and the likely scope of an investigation and hearings; (vi) the involvement of other agencies in the investigation of the respondent's conduct; (vii) the existence of Ethics Commission precedent concerning the alleged conduct; (viii) the age of the facts alleged in the complaint; (ix) the resources and priorities of the Ethics Commission; and (x) whether the respondent self-reported the alleged conduct or sought an advisory opinion regarding it.

c. Any settlement agreement approved by at least three members of the Ethics Commission will be a public record. However, all meetings held and documents relating to the settlement negotiations will be kept confidential, unless the parties agree otherwise.

d. If a settlement agreement is breached by the respondent, the Ethics Commission may rescind the agreement and reinstitute the proceeding. However, no information obtained from the respondent in reaching the settlement, which is not otherwise discoverable, may be used in the proceeding.

Comment: *Most city and town ethics codes do not explicitly deal with settlement agreements, but most state ethics codes do. The above language is based on that of*

several state ethics codes and rules, especially those of Ohio and Georgia. Settlements are especially important because ethics commissions tend to have limited resources. In most cases, there is no need for lengthy investigations and hearings. And since the principle goal of ethics enforcement (as opposed to the criminal process) is to provide guidance, a public settlement agreement that includes a reasonable penalty is more important than an expensive proceeding that may or may not produce a more severe penalty. In fact, some states (and at least one city) make settlement the default or preferred approach. Arkansas' code requires a written Offer of Settlement when probable cause is found. Texas's code requires that, upon a determination that there is credible evidence, the commission "resolve and settle the complaint or motion, to the extent possible." Los Angeles delays public announcement of a finding of probable cause so that a settlement can be reached. Oregon's Administrative Rules "encourages the settlement of a case," and Ohio's extensive settlement rules shows a propensity for settlement. But most codes and rules do little more than mention the possibility of settlement, providing little guidance. Following are a few different approaches or considerations that I have found. Rhode Island explicitly refers to an informal conference between the executive director and the respondent to negotiate a settlement, as well as to a hearing of the commission to review the executive director's settlement (in executive session). Alabama includes the Attorney General or District Attorney in any settlement where they are involved, limiting settlement to "minor violations." Ohio requires consultation with the complainants, and the commission may require the complainant to file an affidavit setting forth the allegations he or she wants the commission to consider in settlement negotiations (and respondent is permitted to respond with an affidavit). Massachusetts provides three alternatives to a settlement agreement: (i) a compliance letter, which warns that future violations may be pursued through a public proceeding in cases where the violation does not involve "willful misconduct, significant economic advantage, the misuse of influence or confidential information, significant economic loss to the public, or the potential for serious impact on the public confidence in its officials"; (ii) a public educational letter, which reviews the alleged violations for preventative and educational purposes, but assesses no civil penalty; and (iii) a public enforcement letter, where the respondent does not admit to a violation. Georgia similarly distinguishes between a settlement where the respondent admits or does not admit to a violation; penalties can be imposed only in the former case.

6. If a complaint is accepted or prepared pursuant to subsections 1 or 3, the Ethics Commission must conduct an investigation. From this point on, the complainant may not withdraw his or her complaint, although he or she may request that the Ethics Commission either make a finding of no probable cause or no violation, or suggest a settlement with the respondent. In conducting such an investigation, the Ethics Commission may administer oaths or affirmations, subpoena witnesses, compel their attendance, and require the production of any books or records it deems relevant and material. The Police Department and all city agencies, bodies, officials, and employees are required to respond fully and truthfully to all enquiries and cooperate with all requests of the Ethics Commission or its agents relating to an investigation. It is a violation of this code for any **official or employee*** to deny access to information

requested by the Ethics Commission in the course of an investigation or a public hearing, except to the extent that such denial is required by federal, state, or local law.

Comment: *The reason complainants are not permitted to withdraw their complaints is to prevent respondents from pressuring them to do so. Once a possible violation has been brought to the Ethics Commission's attention, it is not a proceeding of complainant against respondent, but an ethics issue for the city to determine.*

Some cities might want to go beyond settlement at the complainant's suggestion to allowing the respondent a chance to admit and remedy violations of the code, either by providing a short period (up to two weeks) before the investigation begins, or by allowing remedy during the investigation period itself. The Commission must determine whether any actions truly remedy the situation sufficiently that not even a reprimand is in order. In the alternative, a city might want to allow the Commission to enter into settlement agreements with respondents, allowing for, say, a reprimand in return for remedying a violation, for example, by returning money, resigning from a board, making a formal apology, or changing the terms of a contract. It should be recognized, however, that in many cases, it is too late for a remedy, because action has been taken that cannot be undone.

Please share your experiences with settlements and various sorts of reparations in municipal ethics cases, and what you think of alternative approaches and provisions.

The requirement of cooperation may also be placed among the ethics provisions, because cooperation is an ethical requirement, that is, another way in which government officials should put the public interest (investigating ethics violations) ahead of their personal interests (whatever they may be that might hinder the investigation). It should appear or be referenced here, as well, as a signal to the Commission and others that such cooperation may be expected.

7. The goal of the investigation is to determine whether there is probable cause to believe that a violation of this code has occurred. "Probable cause" means that there are reasonable grounds that a violation has occurred.

Comment: "Preponderance of the evidence" is how this Model Code originally defined "probable cause," but this is the highest burden associated with a finding of probable cause, so it has been lowered. The traditional, criminal law probable cause involves a "fair probability" of criminal activity, which is much less than a preponderance of the evidence. As discussed in [a City Ethics blog post](#), many jurisdictions don't even define "probable cause." I think it's very important to define it. "Reasonable grounds," like "sufficient evidence," means that there is reason to believe there was a violation, but before a hearing and full investigation, there is not evidence sufficient to make it more likely than not that a violation occurred.

8. The respondent may file with the Ethics Commission a response to the complaint within thirty days after his or her receipt of the complaint. The response, if any, must be sent to the complainant by the Ethics Commission within five days after its filing, and, within fifteen days after receipt, the complainant may file with the Ethics Commission a response to the respondent's response, which the Ethics Commission must send to the respondent within five days after its filing.

9. During the investigation period, the Ethics Commission may amend a complaint to include other violations which it reasonably suspects to have occurred. It must send a copy of any such amendment to the respondent and complainant within seven days after the amendment has been made.

10. The investigation will be confidential unless the respondent requests that it be public or unless the respondent makes public the fact of or any information concerning the proceeding. The respondent has the right to appear and be heard, and the complainant has the right to attend any such hearing and be heard.

Comment: Confidentiality during an investigation is important to protect innocent respondents, as well as to depoliticize the process. Complaints are sometimes filed for the express purpose of embarrassing, harassing, or taking revenge on public officials, often during an election season. No one can stop people from making public accusations, but sadly, when accusations become official proceedings, they are taken more seriously by the press as well as by city residents. It is important that the proceedings themselves remain secret until a finding of probable cause has been made, and that an ethics commission be clear that even such a finding is far from an actual finding of a violation. It should be emphasized that confidentiality here refers solely to the proceedings themselves, including their existence, not to the underlying accusations. A resident can tell the world that an official is benefitting from a city contract (whether or not this is true; defamation laws deal with false accusations), but not that the ethics commission is investigating a complaint that makes this accusation.

11. If the Ethics Commission determines that there is no probable cause to believe that a violation of this code occurred, it will dismiss the complaint and send notification of this dismissal to the complainant and respondent. If it determines that there is probable cause, it will send notification of this finding to the complainant and respondent. In its letter of dismissal or notification of finding, which must be sent within five days after the vote on probable cause, the Ethics Commission must set forth a brief summary of the facts and the reasons for dismissal or a finding of probable cause.

12. Nothing in this section may be construed to permit the Ethics Commission to conduct an investigation of itself or of any of its members or staff. If the Ethics Commission receives a complaint alleging that the Commission or any of its members or staff has violated any provision of this code, or any other law, the Commission must promptly transmit to the legislative body a copy of the complaint.

13. If an allegation in a complaint is made under this section with the knowledge that it is without foundation in fact, the respondent has a cause of action against the complainant for damages caused by the complaint. If the respondent prevails in such an action, the court may award the respondent the costs of the action and reasonable legal fees.

14. The city will pay reasonable legal fees with respect to an Ethics Commission proceeding, not including a request for an advisory opinion, (a) to the respondent if the Ethics Commission makes a finding of no probable cause and (b) to the complainant if the Ethics Commission makes a finding of probable cause. The Ethics Commission will determine what fees are reasonable, both the rate and the services rendered.

Comment: Many local governments feel it is fair to protect their officials and employees from having to pay legal fees for frivolous complaints. By requiring a finding of probable cause, this protection is provided. It is less common for local governments to feel it is

fair to help complainants with their legal expenses, even though, if their allegations are true, they are doing a public service. That is why this provision provides for their legal expenses, too, but only if there is substantial evidence that their allegations are true and state a violation. This encourages complainants, who otherwise are taking a risk filing their complaint, both in terms of their jobs, if they are officials or employees, as is common, and in terms of opening themselves up to retaliation suits.

It is important that only reasonable legal fees be allowed. Otherwise, parties will have an incentive to run up large fees, delay and hamper an ethics proceeding, and use an attorney to defend their reputation and other superfluous services. The reimbursement of extravagant legal fees can sink an ethics program. Legal fees prior to a probable cause finding should be limited, because counsel plays a limited role before hearings are held. A complainant's use of counsel should be limited throughout an ethics proceeding. It is best to determine in advance a top fee rate for various types of legal professional, so that this decision is not made for a particular case.

Some respondents file suits in retaliation or to delay or even enjoin an ethics proceeding. These should be considered private matters not subject to reimbursement by the local government. If there is a situation where the city government feels a respondent's suit is necessary and in the public interest, its legislative body should be the one to consider reimbursement of legal fees. But such a situation should be exceptionally rare.

214. Public Hearing Process.

To discuss this section, click [here](#).

To discuss open vs. confidential hearings (dealt with further in [section 217](#)), click [here](#).

1. After a finding of probable cause, the Ethics Commission should hold one or more public hearings, and the first public hearing must commence within sixty days after the finding of probable cause. The goal of these public hearings is to determine whether or not a violation of the Code of Ethics has occurred. The hearings will be held with reasonable promptness, with the last hearing to be held not more than one-hundred-and-eighty days after the finding of probable cause.

2. Any person who is, in the opinion of the Ethics Commission, adversely affected by comments made during a hearing, may testify in response at a hearing, directly or through a representative.

3. The Ethics Commission may refer the matter to an authority or person or body authorized by law to impose disciplinary action pursuant to applicable law or collective bargaining agreement or, if it determines there are possible criminal violations, to the appropriate prosecutor.

4. Extension of time. Extensions of time to any of the time limitations specified in this section may be granted by the Ethics Commission, for cause, which must be stated in granting the extension. If no meeting can be held before such time limit runs out, the chair may extend the limit until the following meeting.

a. The Ethics Commission must give written notice of any extension(s) of time to the respondent and the complainant.

b. No extensions may be given for time periods required for notification.

5. Rules and Procedure for Public Hearings.

a. Public hearings will be conducted under the Ethics Commission's rules and regulations, subject to any applicable provisions of law and collective bargaining agreements. The rules and regulations will include the following: oral evidence will be taken under oath; documentary evidence may be received in the form of copies or excerpts, if the original is not readily available and, upon request, parties and the Ethics Commission will be given the opportunity to compare the copy to the original; the state's administrative rules of evidence, rather than strict rules of judicial evidence, will be followed, to allow a liberal introduction of testimony and documentary evidence; and the respondent has the right:

(1) To be represented by counsel.

(2) To present oral or written documentary evidence which is not irrelevant, immaterial, or unduly repetitious.

(3) To examine and cross-examine witnesses required for a full and true disclosure of the facts.

b. The Ethics Commission may subpoena, and its members may question verbally or in writing, witnesses to testify and may compel production of documents and other effects as evidence, and failure to obey such subpoena shall constitute a misdemeanor.

c. At all hearings relating to a complaint, a court stenographer will record the proceedings.

d. Upon the request of either the complainant, the respondent, or any member of the Ethics Commission, the Ethics Commission will cause the hearings to be tape-recorded or filmed, and a transcript to be made. If this is requested by either a respondent or complainant, the requesting party will bear the costs.

6. With respect to the public hearing process, the Ethics Commission will follow the requirements of Freedom of Information legislation.

215. Finding of Violation; Penalties; Injunctive Relief.

To discuss penalties and other relief, click [here](#).

1. Disciplinary Action.

Within thirty days after the last hearing, the Ethics Commission will determine whether to dismiss the complaint or, upon a finding of a violation of this code, to take appropriate disciplinary action pursuant to **107** of this code, or to recommend disciplinary action to the legislative body in circumstances where such action is required by **107(2)** or by this section.

2. Finding a Violation.

A finding of a violation of this code requires the affirmative vote of three members of the Ethics Commission that there is clear and convincing evidence that the respondent has violated this code. Any member not present at all public hearings and deliberations may not vote. The written final decision must specify the code sections violated and provide a factual explanation supporting each violation or, if no violation is found, findings of fact and the reasons for dismissal. When determining the appropriate penalty, the following should be considered: the severity of the respondent's offense; the position and responsibilities of the respondent; the presence or absence of any intention on the part of the respondent to conceal, deceive, or mislead; whether the violation was deliberate, negligent, or inadvertent; and whether the incident was isolated or part of a pattern.

Another consideration is whether the respondent has depended on advice of counsel, but this cannot be used as a defense against the finding of a violation; only advice of the Ethics Officer or Ethics Commission may be considered as a defense. The Ethics Commission must file its memorandum of decision with the City Clerk, and send it to the complainant and respondent, within ten days after it votes.

Comment: *"Clear and convincing evidence" is only one possible basis on which to find a violation. Please provide information about other bases and your feelings about and experiences with them.*

3. Reprimand or Civil Fine

The Ethics Commission, on behalf of the city, may reprimand any person or entity it finds has violated this code, or it may impose on such person or entity a civil fine as provided in **subsections 2 and 3 of 107** of this code.

4. Damages.

The Ethics Commission, on behalf of the city, may initiate an action in the court of appropriate jurisdiction to obtain damages, as provided in **subsection 4 of 107** of this code.

5. Civil Forfeiture.

The Ethics Commission, on behalf of the city, may initiate an action or special proceeding, as appropriate, in the court of appropriate jurisdiction to obtain civil forfeiture, as provided in **subsection 5 of 107** of this code.

6. Injunctive Relief.

The Ethics Commission, on behalf of the city, may order a violator to cease and desist the violation if the violation is still ongoing, or it may initiate an action or special proceeding, as appropriate, in the court of appropriate jurisdiction for injunctive relief to enjoin a violation of this code or to compel compliance with this code. The Ethics Commission may also order a violator of a disclosure requirement to file an unfiled disclosure statement or to add information to a filed disclosure statement.

7. Suspension and Removal from Office.

The Ethics Commission may suspend or remove a respondent from office, or employ other sanctions or remedies authorized by law or collective bargaining agreement not listed in this section or in **107**.

Comment: See comments to **107(2)** for two alternative approaches to suspension and removal from office, as well as comments re union and civil service conflicts.

8. Prosecutions.

The Ethics Commission may refer possible criminal violations to the appropriate prosecutor. Nothing contained in this code may be construed to restrict the authority of any prosecutor to prosecute any violation of any law.

9. Debarment.

To discuss this and other penalties relating to contracts, click [here](#).

If the Ethics Commission finds that a person or entity has intentionally or knowingly violated any provision of this code, that person or entity is prohibited from entering into any contract with the city for a period not to exceed three years, pursuant to **108** of this code.

10. Limit on Ethics Commission.

Nothing in this section may be construed to permit the Ethics Commission to take any action with respect to any alleged violation of this code, or of any other law, by the Commission or by any of its members or full-time staff members.

11. Penalties imposed by the Ethics Commission are exclusive of, and not affected by, each other or any other penalties imposed pursuant other laws or policies.

Comment: Some cities require their ethics commissions to file suits through the city attorney's office. The problem with this approach is that it brings a political element into enforcement by allow the city attorney's office to choose whether or not to file a suit or, if it does, to determine how to proceed and the amount of resources to devote to the matter. Since the city attorney is generally appointed and supervised by an individual or body that often has a special interest in the outcome of the matter, the city attorney often has a conflict of interest: does he or she act in the interests of a supervisor (loyalty and self-interest) or in the public interest (pursuing violators of the ethics code, but not for political reasons). It is better for the ethics commission to work through counsel that is working for it alone.

216. Judicial Review.

To discuss this section, click [here](#).

Any person or entity aggrieved by a decision of the Ethics Commission, but not a complainant, may seek judicial review and relief from a court pursuant to ----- of [state law]. The party appealing must immediately serve notice of the appeal on the Ethics Commission.

Comment: Judicial review is not on a de novo basis.

217. Public Inspection of Records; Public Access to Meetings.

To discuss this section, click [here](#).

1. Unless otherwise stated in this code, the records of the Ethics Commission will be available for public inspection. Records available for public inspection include all disclosure statements, advisory opinions (with names and other necessary details omitted to protect anonymity, unless the requesting party states otherwise in writing), all requests for waivers and related papers and decisions, and all papers filed and all decisions made in an Ethics Commission proceeding after a finding, formally or presumed, of probable cause.

2. After a finding, formally or presumed, of probable cause, all hearings before the Ethics Commission concerning alleged misconduct will be open to the public. All meetings, or parts of meetings, of the Ethics Commission that are not directly related to an investigation or other consideration of complaints prior to a finding of probable cause will be open to the public.

218. Miscellaneous Provisions.

To discuss this and the following miscellaneous provisions (218-222, click [here](#).

1. No existing right or remedy may be lost, impaired, or affected by reason of this code.

2. Nothing in this code may be deemed to bar or prevent a present or former city **official or employee*** from timely filing any claim, account, demand, or suit against the city on

behalf of himself or herself or any member of his or her family arising out of personal injury or property damage or any lawful benefit authorized or permitted by law.

3. Any law of any sort - local, state, or federal - that requires a higher, greater, more exacting, or more restrictive standard of conduct than is provided in this code prevails over the provisions of this code and continues in full force and effect with respect to those covered by this code.

219. Distribution and Posting.

1. Within ninety days after the effective date of this section, and thereafter as appropriate, the Ethics Commission will transmit to the [chief executive official] of the city, in a form suitable for posting, those provisions of this code which the Ethics Commission deems necessary for posting. Within thirty days after receipt of those copies, the [chief executive official] must cause the copies of these provisions to be posted conspicuously in every public building under the city's jurisdiction.

2. Within ninety days after the effective date of this section, and thereafter as appropriate, the Ethics Commission will transmit to the [chief executive official] of the city, in a form suitable for distribution, a copy of this code. Within thirty days after receipt of this copy, the [chief executive official] must cause the copies to be distributed to every official and employee, to every contractor with the city, and to all city **consultants***, and must make the code readily available to the public by placing a copy on the city website and copies in the city libraries and the office of the City Clerk.

3. Every **official or employee*** elected, appointed, or hired thereafter must be furnished a copy of this code within ten days after entering upon the duties of his or her position. Each official employee, present and future, must within thirty days of receipt sign a statement that he or she has read and understood the code's provisions, and must file that statement with the Ethics Commission. In addition, such a statement should be signed and filed with the Ethics Commission every year on January 31 or, if filing an annual disclosure statement, accompanying that statement.

4. Failure of the city to comply with the provisions of this section or failure of any **official or employee*** to receive a copy of the provisions of this code shall have no effect on the duty of compliance with this code or on the enforcement of its provisions.

220 Liberal Construction of Code.

The provisions of this Code are to be construed liberally, to the end that the public interest be fully protected, and they are to be construed in a manner consistent with all applicable federal and state laws and applicable provisions of the City Charter.

221 Severability.

If any provision of this Code is held by any court, or by any federal or state agency of competent jurisdiction, to be invalid as conflicting with any federal, state, or City Charter provision, or is held by such court or agency to be modified in order to conform to the requirements of such provision, the conflicting provision of this Code is to be considered a separate, independent part of this Code, and such holding shall not affect the validity or enforceability of this Code as a whole or any part other than the part declared to be invalid.

222. Effective Date.

This law will take effect immediately upon filing in the office of the Secretary of State and in compliance with all applicable provisions of law.

APPENDIX A

Sample Annual Disclosure Statement

Annual Disclosure Statement for 2007

Last Name First Name Initial

Title Department, Agency, or Body

Work Address Phone No.

Home Address Phone No.

If the answer to any of the following questions is "none," please so indicate. If you have more than one entry for any of the sections, please fill out separate sheets and attach to these sheets. If you could not obtain the required information from a spouse or other relative, set forth your efforts to obtain information on a separate sheet attached to this statement.

1. Real Estate.

List the address or, if there is no address or if the address provides insufficient information to describe a large piece of property, description of each piece of real property in this city, or within one mile outside its boundaries, that you, your spouse, or other relative own or have a **financial interest** in. "Relative" means your spouse, child, step-child, brother, sister, parent or step-parent, or a person you claimed as a dependent on your latest state income tax return.

Name of Relative and Relationship to You

Address or Description of Real Estate

Type of Financial Interest (e.g., owns or partnership)

2. Your Outside Employers or Businesses.

List the names and address of the principal or local office of any outside employers or businesses from which you receive compensation for services rendered or goods sold or produced, or of which you are a member, official, or employee. Also include any entity in which you have an ownership interest, except a public corporation of which you own less than five percent of the outstanding stock or stock valued at less than \$50,000, whichever is less (such a public corporation need be listed only if it does business with or in the city). Identify the type of entity (e.g., partnership, corporation, self-employment, or sole proprietorship), and list your relationship to the employer or business (e.g., employee, owner, partner, official, director, member, or shareholder).

Name of Employer or Business

Nature of Business

Type of Entity

Your Relationship to Employer or Business

3. Your Spouse's or Domestic Partner's Employer or Business.

List the information in question 2 for your spouse or domestic partner.

Name of Employer or Business

Nature of Business

Type of Entity

Relationship to Employer or Business

4. Employed Relatives.

List the names and addresses of all relatives employed, directly or indirectly, as employees, contractors, or consultants, by the city during the prior year. See 1 above for definition of "relative."

A Resolution
In the Council of the District of Columbia

To establish a new Council Rule on Procedures for the Reprimand and Censure of Council Members.

RESOLVED, BY THE COUNCIL OF THE DISTRICT OF COLUMBIA, That this resolution may be cited as the “Council Reprimand and Censure Procedures Resolution of 2009”.

Rule ____ Definitions

(a) Reprimand. A reprimand should be directed to a particular Council Member based on a particular action or actions determined to be in violation of law or District or Council policy, but considered by the Council to be not sufficiently serious to require censure. A reprimand is distinguished from censure in that it is not a punishment. A reprimand may be issued based upon the Council's review and consideration of a written allegation of one or more violations. The Member accused of such violations will have an opportunity to provide a written response to the allegation. A reprimand may be issued by the City Council and, because it is not punishment or discipline, does not require an investigation or separate hearing.

(b) Censure. Censure is a formal statement of the Council officially disciplining one of its members. It is a punitive action, which serves as a penalty imposed for wrongdoing, but it carries no fine or suspension of the rights of the Member as an elected official. Censure should be used for cases in which the Council determines that the violation of law or policy is a serious offense. In order to protect the overriding principle of freedom of speech, the Council will not impose censure on any of its members for the exercise of his or her First Amendment free speech rights, no matter how distasteful the expression was to the Council and the District.

Rule ____ Procedures

(a) Investigations

(1) A Member of the Council seeking censure as a penalty may submit, in writing, allegations concerning violations of law or policy to the Committee on Government Operations and Environment.

(2) If the Member seeks only reprimand as a penalty, he or she may submit the allegations, in writing, directly to the Council Chairman, who will determine whether to send it to the Committee on Government Operations and Environment for an investigation or present the allegations directly to the Council as a request for reprimand pursuant to (b) below.

(3) The said Committee, in a closed meeting, will determine whether to forward a recommendation to conduct an investigation to the full Council for consideration at an appropriate subsequent Council meeting.

(4) If the Committee recommends an investigation, the Council will consider, by majority vote, pursuant to Article VI of these Rules, a resolution authorizing an investigation. The Council may choose not to authorize an investigation, but instead proceed directly to a hearing pursuant to (c)(4) below.

(5) If the Committee does not recommend an investigation or the Council neither votes to authorize an investigation nor votes to proceed to a hearing, the Council member alleging the violations may submit a request for reprimand to the Council Chairman. Otherwise, the allegations are dismissed.

(b) Requests for Reprimand

(1) A copy of a request for reprimand must be provided to the Council Member accused of the conduct by personal service at least seven days prior to the Council meeting at which it will be considered, and the Council Member may file a written response to the allegations included in the request.

(2) The Council must determine, in a closed meeting, by majority vote:

- a. To reprimand the Council Member, or
- b. To take no action.

(c) Requests for Censure

(1) A copy of a request for censure must be provided to the Council Member accused of the conduct by personal service at least seven days prior to the meeting of the Committee on Government Operations and Environment at which it will be considered, and the Council Member may file a written response to the allegations included in the request.

- (2) After the Committee determines that an investigation is complete, the results of the investigation will be presented in writing to the full Council. The Council, by majority vote, in a closed meeting, will determine whether to proceed with the request or dismiss the allegations.
- (3) If the Council votes to proceed with the request, it will schedule a non-public fact-finding hearing. The Council Member accused will be given at least two weeks to prepare a defense.
- (4) At the hearing, the Council Member accused will be given the opportunity to make an opening and closing statement. If any of the alleged conduct occurred outside the Council's proceedings, the Council Member accused may present witnesses at the hearing and question his or her accusers and any other witnesses that are presented. If the alleged conduct occurred within the Council's proceedings, then witnesses are not necessary. However, in either case, evidence may be presented and responded to, and the Council Member accused may be represented and may have the representative speak or question on his or her behalf. Judicial rules of evidence do not apply at the hearing, which is not a formal adversarial proceeding. Council's General Counsel will provide legal advice to the Council during the hearing and may question witnesses and present evidence on its behalf.
- (5) A decision to censure requires the adoption of a Resolution making findings with regard to the specific allegations, based on substantial evidence and approved by a two-thirds vote of the Council.

Appendix A
Current Council Rules Relevant to This Resolution.

Council Rule 101(35) "Resolution" means an expression of a simple determination, decision, or direction of the Council of a special or temporary character and includes actions of the Council concerning its internal management and conduct.

Council Rule 251. Creation of Special Committees

Special committees to consider investigations, ethics, and other matters may be created by resolution, approved by 2/3rds of the members of the Council. The resolution shall set forth the jurisdiction, size, duration, and date for final action of the special committee.

Council Rule 421. Notice to Members

(a) The Secretary shall distribute, upon introduction, a copy of each measure to each member and, upon referral, to each committee to which the measure is assigned. The Secretary shall also distribute to each member, upon introduction or filing, a copy of each notice of public hearing or roundtable, notice of investigation by subpoena, and Mayoral disapproval of a Council act.

Council Rules Article VI on Investigations and Subpoenas
Rules for investigations.

Council Rule 1001. Parliamentary Authority.

Matters not covered by these Rules will be governed by Robert's Rules of Order, Newly Revised. It is the duty of the Chairman to interpret the Rules.

Also see Attorney General's Letter of Advice Regarding Resolution of Censure dated July 20, 2009.

Rule 1 – Scope, Jurisdiction, Definitions and Applicability.

- (a) **Enabling Law.** These Complaint Procedures (“Procedures”), pursuant to the Code, shall govern the receipt and disposition of all Complaints to the Commission concerning violations of the Code. These Procedures shall become effective as of the date of adoption by the Commission. As of the date these Procedures are adopted, they shall govern disposition of all Complaints regardless of date of filing.
- (b) **Jurisdiction.** The Commission shall have jurisdiction as stated in the Code and the Charter of the City of Jacksonville.
- (c) **Definitions.** Definitions are defined in the Code, Section 602.201, and in these Procedures as follows:

Clear and Convincing Evidence means evidence that is precise, explicit, lacking in confusion, and of such weight that it produces a firm belief or conviction, without reasonable hesitation, about the matter in issue.

Code means Chapter 602 of the City of Jacksonville Code of Ordinances.

Complainant means the individual who brings a Complaint forward for the Commission’s review.

Complaints Committee means a division of the Commission vested with the jurisdiction to receive Complaints, recommend self-initiation of Complaints to the full Commission, appoint Investigators and Special Ethics Counsel(s), dismiss Complaints, recommend a finding of Probable Cause to the full Commission, submit a Sworn Complaint to the Hearing Panel for public proceedings, and conduct such other proceedings as necessary or ancillary to its duties under the Code and these Procedures. The Complaints Committee shall be comprised of no less than three members of the Commission. Decisions within the authority vested in the Complaints Committee under these Procedures are not reviewable by the full Commission.

Confidentiality means the authority, pursuant to Fla. Stat. § 112.324 and Code § 602.921(a), to hear pending Complaints in Executive Session and to hold documents relating to Complaints in a confidential manner, so they are not subject to public records laws until authorized by statute, in accordance with these Procedures.

Council Auditor means the City of Jacksonville Council Auditor's Office, including the Council Auditor and members of the Council Auditor's staff.

Complaint means an alleged violation of the Code which has been brought to the attention of the Office of Ethics, Compliance and Oversight or the Commission. In accordance with the Code, a Complaint may initially be received by any source (email/phone-call/hotline) but, in order to be processed as an official complaint, must be a Sworn Complaint alleging a violation of Chapter 602 or a Self-Initiated Complaint by the Commission. (Section 602.921(a)). For the purposes of these Procedures, the term Complaint shall apply to all types of Complaints.

Ethics Deputy Director means the person appointed by the Commission as the Deputy Director of the Office of Ethics, Compliance and Oversight.

Ethics Director means the person identified in Chapter 602, Part 6 as the Director of the Office of Ethics, Compliance and Oversight.

Executive Session means those meetings which are authorized by and conducted in accordance with Fla. Stat. § 112.324 (shade meetings); these meetings shall be recorded, pursuant to Code § 602.931(c).

Ex Parte Communications means any oral or written communication to a decision-making official relative to a matter before the decision-making body that occurs outside of an Executive Session or advertised public meeting pursuant to Fla. Stat. § 286.011, as set forth in Rule 15. Ex Parte Communications shall not include any communications with staff of the Office of Ethics, Compliance and Oversight or the Office of General Counsel liaison to the Commission.

Hearing Officer means such person as may be appointed by the Hearing Panel pursuant to Rule 12(f) to conduct proceedings and issue reports and recommendations on matters referred by the Hearing Panel relative to a Complaint. To serve as Hearing Officer, the candidate must be and have been a member of The Florida Bar in good standing for the preceding five years. A member of the Commission may serve as a Hearing Officer if otherwise qualified, but cannot have participated in or attended any Executive Session at which the Complaint for which he or she is appointed to serve as Hearing Officer was discussed.

Hearing Panel means a division of the Commission vested with the authority to receive and hear Complaints after a finding of Probable Cause by the Commission, to recommend a finding of violation of the Code to the full Commission, dismiss Complaints, and conduct such other proceedings as necessary or ancillary to its duties under the Code and these Procedures. The Hearing Panel shall be comprised of at least three members of the Commission who did not participate in or attend any Executive Session at which the Complaint for which they are appointed to serve on the Hearing Panel was discussed. Decisions within the authority vested in the Hearing Panel under these Procedures are not reviewable by the full Commission.

Hotline tip means any information related to an alleged violation of the Code.

Inspector General means the City of Jacksonville Inspector General's Office, including the Inspector General and members of the Inspector General's staff.

Investigator means the Ethics Director, a member of the Office of Ethics, Compliance and Oversight, the Council Auditor, the Office of General Counsel liaison to the Commission, the Inspector General, one or more members of the Commission or any other appropriate person or municipal agency who is authorized by these Procedures or the Code to conduct an investigation into a Complaint.

Legal Sufficiency refers to Complaints that are deemed legally sufficient if the Complainant sufficiently alleges facts which, if true, would constitute a violation of the Code.

Probable Cause means that the facts and circumstances are sufficiently strong to support a reasonable belief that the Respondent had committed a violation of the Code.

Respondent means the individual who is the subject of the Complaint.

Self-Initiated Complaint means a Complaint instituted by the Ethics Commission in accordance with Code § 602.921 and Rule 8.

Special Ethics Counsel means the individual appointed by the Complaints Committee to conduct appropriate investigation, gather and present evidence before the Commission (or any division thereof) with respect to a

Complaint, and otherwise advise the Complaints Committee in connection with the prosecution of a Complaint. Any individual as set forth in Rule 11 may serve as Special Ethics Counsel.

Sworn Complaint means a Complaint initiated by the receipt of a Complaint which is signed by a Complainant under oath and otherwise compliant with Rule 5(b).

- (d) **Amendment to Procedures.** These Procedures may be amended at any regular meeting by a majority vote of the Commission, provided that the amendment has been submitted in writing (1) at the previous regular meeting or (2) to the Ethics Director and Office of General Counsel liaison to the Commission at least 10 days prior to the Ethics Commission meeting at which the Procedures will be amended. For amendments submitted under Rule 1(d)(2), the Office of Ethics, Compliance and Oversight shall transmit the proposed amendments to all members of the Commission before the Commission meeting at which the Procedures will be amended. Amendments to the Procedures govern all future proceedings of the Commission, including those proceedings on pending cases.

Rule 2 – Time Periods and Statute of Limitations.

- (a) **Computation of Time.** In computing any period of time prescribed or allowed by these Procedures: exclude the day of the event that triggers the period; count every day, including intermediate Saturdays, Sundays, and legal holidays; and include the last day of the period, but if the last day is a Saturday, Sunday, or holiday for which the City of Jacksonville is closed, the period continues to run until close of business on the next day that is not a Saturday, Sunday, or holiday for which the City of Jacksonville is closed.
- (b) **Statute of Limitations.** No action may be taken on a Complaint filed more than two years after the violation is alleged to have occurred unless a person, by fraud or other device, prevents discovery of the violation. (Section 602.939). Notwithstanding anything else in these Procedures, a Complaint alleging prevention of discovery of a violation must allege specific facts supporting that conclusion. A Complaint that is filed more than two years after the violation is alleged to have occurred and does not allege specific facts to support a finding that fraud or other device prevented discovery of the alleged violation shall be considered legally insufficient and may be returned by the Ethics Director pursuant to Rule 6(a).

- (c) **Extending or Shortening Time.** Other than Rule 2(b), the periods of time in these Procedures are not jurisdictional and the Complaints Committee, Hearing Panel, or the relevant division's Chairs may (1) extend periods of time for good cause, (2) shorten periods of time with the consent of the person subject to such period of time, and (3) shorten periods of time without the consent of the person subject to such period of time when the Complaints Committee, Hearing Panel, or the relevant division's Chair decides the passage of time could reasonably be expected to render moot the ultimate disposition of the matter by the Commission, Hearing Panel, or Complaints Committee, so long as the relevant authority decides the shortened period of time provides reasonable time under the circumstances.

Rule 3 – Filing and Serving Documents; Email Transmissions.

Documents under these Procedures shall be filed with the City of Jacksonville's Office of Ethics, Compliance and Oversight, and served, when service is required, by email, mail, hand delivery, or any combination thereof, except where specifically provided otherwise herein.

Rule 4 – Presiding Officer of Hearing Panel.

For purposes of proceedings under these Procedures before the Hearing Panel, the presiding officer shall be the Chair of the Commission or, in the event the Chair is unavailable, the Vice Chair of the Commission. The presiding officer may appoint another Commission member to serve as presiding officer for any reason in his or her discretion.

Rule 5 – Procedures Upon Receipt of a Complaint of Violation of the Code.

- (a) **Safeguarding Confidential Materials.** Upon receipt of a Complaint, the Office of Ethics, Compliance and Oversight shall print on the face thereof the date on which the Complaint was received in the Office of Ethics, Compliance and Oversight. Each Complaint received shall be assigned a control number which shall be entered on the Complaint itself and on a folder marked confidential in which the Complaint shall be filed so long as it remains Confidential. Any document related to the Complaint shall be filed in the Complaint file.
- (b) **Technical and Clerical Review for a Sworn Complaint.** Upon receipt of a Sworn Complaint, the Ethics Director shall review the Complaint to ensure that the proper Sworn Complaint form has been used, that all the information required has been provided, that only one Respondent has been named in each Sworn Complaint form submitted, and that the Sworn Complaint has been properly

signed by the Complainant under oath. One or more persons may sign a Sworn Complaint under oath; however, when the Sworn Complaint is to be filed under oath in a representative capacity on behalf of an incorporated association or group, the Sworn Complaint shall include sufficient information to indicate the authority of the person signing the Sworn Complaint to file such a Sworn Complaint on behalf of the association or group. If the Complaint is filed on behalf of an unincorporated group or association, the person(s) signing the Complaint shall be considered to be the Complainant(s) rather than the group or association. If the Sworn Complaint lacks any of the foregoing or is otherwise incomplete, a copy of the Sworn Complaint shall be returned to the Complainant identifying the defect.

- (c) **Assistance.** The Ethics Director or the Ethics Deputy Director shall provide assistance or information to persons seeking to file a Complaint, but shall not solicit or discourage the filing of a Complaint.
- (d) **Transmittal of Sworn Complaint to Respondent.** Except as provided otherwise herein, a copy of the original Sworn Complaint shall be transmitted to the Respondent by hand delivery or by certified mail, return receipt requested, by the Office of Ethics, Compliance and Oversight within ten days of its receipt. Subsequent sworn amendments to the Sworn Complaint shall be transmitted to the Respondent within five days of their receipt. If the Respondent submits a written request to the Office of Ethics, Compliance and Oversight for transmittal by any other means, the Office of Ethics, Compliance and Oversight may, at the Ethics Director's discretion, use the requested means, use hand delivery, or use certified mail. The Ethics Director shall transmit the Sworn Complaint with a cover letter that includes (without limitation) information on access to the Commission's Procedures, ways to contact the Commission, and information on how to submit documents or settlement proposals. The Ethics Director may elect, with the permission of the Chair of the Complaints Committee, to delay service of the Sworn Complaint in any matter where service of the Sworn Complaint on the Respondent would interfere with an investigation by another state or municipal agency or for other good cause. In such event, the Ethics Director shall, at the next scheduled Executive Session of the Complaints Committee, inform the Complaints Committee of the decision to delay service. The Complaints Committee may review the decision to delay service and decide, by majority vote, whether to affirm or reverse the delay of service.
- (e) **Submissions to the Commission.** The Respondent and/or his or her counsel may, in their discretion and at any time during any stage of the Commission's proceedings, make written submissions to the Commission, which may include

proposals to resolve Complaints pursuant to Rule 17, by filing those submissions with the Office of Ethics, Compliance and Oversight.

- (f) **Complaints Within 15 Days of Election Returned.** Any Complaint against a candidate in a general, special, or primary election that is received within the fifteen days immediately preceding the date of that election, will be returned by the Office of Ethics, Compliance and Oversight to the person filing the Complaint, with an explanation of why the Complaint is being returned without any action being taken by the Commission. A Complaint returned pursuant to this provision and subsequently refiled after the election shall be deemed to have been filed on the date the Complaint was first submitted to the Office of Ethics, Compliance and Oversight.
- (g) **Probable Cause Determination.** Complaints that are not otherwise disposed of, shall then proceed to subsequent investigation pursuant to these Procedures and, if applicable, consideration by the Complaints Committee and Commission to determine whether Probable Cause exists that a violation of the Code occurred, in accordance with Rule 11.

Rule 6 – Review for Sufficiency of Allegations of Violations of the Code and Order of Preliminary Investigation For Complaints.

- (a) **Review for Legal Sufficiency and/or Jurisdiction.** After the Complaint has been received, the Complaint shall be reviewed by the Ethics Director in order to determine whether the Commission has jurisdiction over the Complaint; that is, whether the Complaint is one concerning a violation of the Code that occurred within the statute of limitations (Section 602.939). If the facts in the Complaint (1) fail to allege a violation of the Code, (2) allege a violation of state ethics laws or dual jurisdiction under state and local ethics laws, or (3) a violation of the Code that occurred wholly outside the statute of limitations, the Ethics Director may, with notice to the Complaints Committee and the approval of its Chair, return the Complaint to the Complainant with notice pursuant to Rule 6(b). Complaints need not be as precise as would be required by the rules of civil procedure in a court of law and shall be deemed sufficient for purposes of Rule 6(a) if the Complainant sufficiently alleges facts which, liberally construed and if true, would constitute a violation of the Code. A Complaint shall not be insufficient because it is based upon evidence which would be hearsay evidence in a court of law. In order to make this determination, the Ethics Director may request additional information from the Complainant, consult with the Office of General Counsel liaison to the Commission, and obtain information from public records or otherwise.

- (b) **Notice of Return.** If a Complaint is returned pursuant to Rule 6(a), the Ethics Director shall provide written notice informing the Complainant of the reason for the return (whether Rule 6(a)(1), 6(a)(2), or 6(a)(3)). If a Complaint is returned pursuant to Rule 6(a)(2)), the notice of return shall include instructions on how to file a Complaint with the Florida Commission on Ethics. All notices pursuant to Rule 6(b) shall contain the following language in all capital letters and 14-point font: YOU MAY SEEK REVIEW OF THE DECISION TO RETURN YOUR COMPLAINT PURSUANT TO RULE 6(c) OF THE COMPLAINT PROCEDURES OF THE JACKSONVILLE ETHICS COMMISSION, AVAILABLE AT [Ethics Director to insert current website address for these Procedures]. THE PROCEDURES IMPOSE IMPORTANT DEADLINES AND OTHER REQUIREMENTS THAT YOU MUST CHECK IMMEDIATELY TO AVOID WAIVER OF REVIEW.
- (c) **Review of Rule 6(a) Return.** If a Complaint is returned pursuant to Rule 6(a), the Complainant may—by written request filed with the Office of Ethics, Compliance and Oversight within thirty days of the Ethics Director’s transmittal of the notice of return—seek review by the Complaints Committee. The written request may include additional argument and evidence. In such event, the decision to return the Complaint shall be reviewed by the Complaints Committee at an Executive Session, at which the Complaints Committee shall decide, by majority vote, whether to affirm or reverse the decision to return the Complaint. The Complaints Committee shall review the Ethics Director’s decision without deference (as if deciding the matter for the first time). If no written request for review pursuant to this Rule 6(c) is received by Office of Ethics, Compliance and Oversight within thirty days of the Ethics Director’s transmittal of the notice of return, the Ethics Director’s return shall constitute final action of the Commission and the Complaint and all documents related thereto shall become a public record and constitute a public report.
- (d) **Preliminary Investigation.** If the Ethics Director finds that the Complaint is sufficient to invoke the jurisdiction of the Commission, the Ethics Director shall, after consultation with and permission of the Chair of the Complaints Committee or, if he or she is unavailable, the Vice-Chair, (1) commence a preliminary investigation of the Complaint, (2) refer it to any other agency whose jurisdiction or purview is appropriate, or (3) prepare it for Complaints Committee consideration. The Chair of the Complaints Committee may schedule an Executive Session of the Complaints Committee, as appropriate. In the event of a referral to another agency, pursuant to Code § 602.938, the Complaints Committee may dismiss or stay any consideration of the matter until the conclusion of the other agency’s actions on the matter, and shall otherwise avoid

interfering with any ongoing criminal investigation or prosecution or any investigation or proceeding of the Florida Commission on Ethics.

- (e) **Executive Sessions.** If an Executive Session is scheduled, the Complaint shall be brought before the Complaints Committee in Executive Session with the recommendations of the Ethics Director, including (without limitation) recommendations for appointments of the Investigator and Special Ethics Counsel. The Complaints Committee may find the Complaint to be sufficient and order an investigation; may find the Complaint to be insufficient, dismiss it, and notify the Complainant that no investigation will be made; or may take such other action as may be appropriate. In any case where a Complaint is found legally insufficient and dismissed by the Complaints Committee, a summary of the reasons for dismissing the Complaint together with the Complaint itself and all documents related thereto shall become a public record and constitute a public report.
- (f) **Personnel Actions.** When an Employee of the City or one of its agencies is alleged to have violated the Code and, based on substantially the same set of facts, is subject to an ongoing disciplinary action by the City or one of its agencies, pursuant to Code § 602.938, the Complaints Committee shall stay consideration of a Complaint until the conclusion of the personnel proceeding. Nothing herein shall abridge any rights such an employee may have to collective bargaining or Civil Service Rules.

Rule 7 – Withdrawal of Complaints.

After a Complaint has been determined to be sufficient to invoke the jurisdiction of the Commission, the Commission may permit the Complainant(s) to withdraw the Complaint. Prior to a finding of Probable Cause, this authority is vested in the Complaints Committee. After a finding a Probable Cause, this authority is vested in the Hearing Panel. Withdrawal shall be requested in writing and shall be signed by the Complainant(s) and sworn before a notary public, stating the facts and circumstances constituting good cause for withdrawal of the Complaint. The Ethics Director shall prepare a recommendation regarding disposition of the request, which shall be given to the relevant division of the Commission together with the request. "Good cause" shall be determined based upon the legal sufficiency or insufficiency of the Complaint to allege a violation of the Code, the stage in disposition of the Complaint at the time the request was received, whether the Complaint should proceed in the judgment of the relevant division of the Commission despite the Complainant's wishes, the reasons given by the Complainant(s) for wishing to withdraw the Complaint, and any other considerations important to the Commission. If withdrawal is permitted, the relevant

division of the Commission shall order the Complaint dismissed and shall proceed as if the Complaint had been found insufficient under Rule 6(e). Whether or not the Commission allows withdrawal of the Complaint, the Commission may also proceed with the Complaint on their own initiation, subject to self-initiation Procedures.

Rule 8 – Self-Initiation of Complaints by the Commission.

The following process shall be followed for the Commission to self-initiate a Complaint against a city Employee or Official, or any other person subject to the Code.

- (a) **Executive Session.** Pursuant to Fla. Stat. § 112.324, any discussions by a Commission member about initiating an investigation against any person subject to the Code shall be initiated in either an Executive Session of the Complaints Committee or of the Commission as a whole. The Commission member desiring to engage in such discussions shall request, through the Office of Ethics, Compliance and Oversight, that such a meeting be scheduled or that the discussion be added to the agenda for the next scheduled meeting.
- (b) **Executive Session of the Complaints Committee.** The Complaints Committee shall handle the initial discussions and investigations of any Complaint matters in an Executive Session. After deliberation(s), the Complaints Committee shall make a motion and a written recommendation to the entire Commission that: (1) a proposed Complaint is determined to be legally insufficient or (2) a Complaint is determined to be legally sufficient and that the Commission should self-initiate a Sworn Complaint.
- (c) **Assistance to the Complaints Committee.** The initial recommendation of the Complaints Committee shall be done with the assistance of the Ethics Director and the Office of General Counsel liaison to the Commission.
- (d) **Notice of Complaints Committee Recommendation to Respondent.** After the Complaints Committee's recommendation vote, a copy of such written recommendation containing a statement of the allegation(s) shall be provided to the Respondent at least ten days prior to the meeting of the Executive Session of the Commission when the Commission will consider whether to self-initiate a Complaint.
- (e) **Transmittal of Complaint to Executive Session of the Commission.** The recommendation of the Complaints Committee shall be considered by the Commission as a whole, at which time the Commission shall either: (1) vote to

self-initiate a Complaint alleging a violation of the Code, which such vote shall require a minimum of six members of the Commission voting in the affirmative of such action or (2) otherwise dispose of a Complaint. In the event a Self-Initiated Complaint is approved by the Commission, a Sworn Complaint form, as is filed by citizens for Sworn Complaints, shall be filed and signed by the Chair of the Commission or, if the Chair votes against self-initiating, by the Vice Chair, Complaints Committee Chair, or senior member of the Commission who voted in favor of self-initiating. The Self-Initiated Complaint then shall be referred to the Complaints Committee for such further proceedings as any other Sworn Complaint.

- (f) **Respondent's Right to Attend Executive Session of the Commission.** The Respondent and/or his or her counsel shall be permitted to attend the Executive Session of the Commission where consideration as to whether to self-initiate a Complaint will be determined. The Respondent and/or his or her counsel may, in their discretion, make a written and/or oral statement to the Commission prior to the Commission's vote on whether to self-initiate a Complaint. The Commission may excuse the Respondent and his/her counsel at any time before and after the Respondent has been heard.
- (g) **Transmittal of Complaint to Respondent.** Except as provided otherwise herein, a copy of the Sworn Complaint shall be transmitted to the Respondent by hand delivery or by certified mail, return receipt requested, by the Office of Ethics, Compliance and Oversight within ten days of the Commission's Executive Session meeting where the Commission approves commencement of a Self-Initiated Complaint. If the Respondent submits a written request to the Office of Ethics, Compliance and Oversight for transmittal by any other means, the Ethics Director may, at his or her discretion, use the requested means, use hand delivery, or use certified mail.

Rule 9 – Initiation of Investigations Based on Hotline Tips or Complaints

- (a) **Receipt and Review of Hotline Tips or Complaints.** The Office of Ethics, Compliance and Oversight shall review Hotline tips or Complaints and report them to the Complaints Committee. Hotline tips shall be treated as anonymous if the Complainant does not identify himself or herself and does not provide any identifying information. In accordance with Fla. Stat. § 112.324(2)(e), identifying information provided by a Complainant will become public record when the Complaint becomes a public record pursuant to these Procedures and applicable law. Hotline tips may relate to various issues within the City, and the Office of Ethics, Compliance and Oversight may coordinate contact with the appropriate

City department. The Ethics Director may promulgate additional operational procedures to regulate the Hotline and processing of Hotline tips.

- (b) **Presentation to Complaints Committee.** When the Ethics Director presents a Hotline tip or Complaint to the Complaints Committee for review, he or she shall provide a recommendation. After review of the Complaints Committee, Hotline tips may be further investigated and Complaints shall be processed in accordance with Rule 6 or, if applicable, Rule 8.
- (c) **Hotline Tip or Other Complaint Procedure.** Unless disposed otherwise in accordance with these Procedures, all Hotline tips and Complaints shall be reviewed, considered and determined by the Complaints Committee for further investigation, action or disposal as follows: (1) if it's not a violation of the Code, it shall be disposed of by the Complaints Committee; (2) if it's an alleged violation of another jurisdiction's purview, it may be referred to the appropriate agency by the Complaints Committee, if applicable and where appropriate; (3) if it's an alleged violation of the Code, it may be further investigated pursuant to Rule 10; or (4) otherwise dismissed by the Complaints Committee pursuant to Rule 17.

Rule 10 – Investigations

- (a) **Investigations.** At the discretion of the Chair of the Complaints Committee, investigations of any matters not referred to an outside agency may be conducted by the Office of Ethics, Compliance and Oversight, by the Council Auditor, by the Office of General Counsel liaison to the Commission, by the Inspector General, by one or more members of the Complaints Committee, or by any other appropriate person or municipal agency as provided for in the Code. In the event a member of the Commission serves as the Investigator, such member shall not have served on the Complaints Committee at the time of the Probable Cause finding for the particular Complaint for which the Investigator is appointed or on the Hearing Panel for that Complaint.
- (b) **Scope of Investigation.** Investigations shall be limited to the allegations of the Complaint or the Hotline tip, but shall include an investigation of all facts and persons related to the Complaint or tip at issue.
- (c) **Evidence Unrelated to the Complaint.** If, during the course of an investigation, the Investigator discovers evidence of a wrongful act not materially related to the Complaint or tip at issue or facts giving the Investigator reason to suspect a different potential violation of the Code, the Investigator shall submit such evidence and/or facts to the Complaints Committee in a separate Investigator's

report. The Investigator shall not further investigate such wrongful act or potential violation(s) without further direction from the Complaints Committee. Upon receipt of a separate Investigator's report containing such evidence or facts, the Complaints Committee shall: (1) as soon as practicable forward evidence of the commission of a crime or other wrongful act to the appropriate disciplinary or law enforcement official and/or (2) treat potential violations of the Code in the same manner as a Hotline tip. If such official or if the Investigator wishes to file a Sworn Complaint with the Commission, he or she may do so and said Sworn Complaint shall be received and considered by the Commission in the same manner as any other Sworn Complaint. Investigator's reports pursuant to Rule 10(c) shall be maintained as part of the Confidential file with the information treated as a Hotline tip, and shall be transmitted to the Respondent together with the information required by Rule 8(d).

- (d) **Investigator Contacts with Potential Witnesses.** The Investigator shall inform the person being interviewed of the Confidential nature of the investigation and of the Complaint, unless the Respondent has waived confidentiality in writing.
- (e) **Investigator to be Impartial.** An Investigator shall strive to be impartial and unbiased in the conduct of the preliminary investigation. It is the duty of the Investigator to collect all evidence materially related to the allegations of the Complaint, whether such evidence tends to prove or disprove the allegations. If an Investigator feels that for any reason he or she cannot be impartial or unbiased during the investigation then such Investigator shall so notify the Ethics Director or Chair of the Complaints Committee and shall immediately discontinue working on the investigation. If the Complaints Committee feels that the Investigator cannot be unbiased or impartial at any point in time during the preliminary investigation, the Complaints Committee shall terminate any further investigation by the Investigator. The Complaints Committee may also terminate any further investigation by the Investigator if at any time there is the appearance of bias or partiality. No Complainant may serve as an Investigator while his or her Complaint is active before the Commission. The Investigator serves at the pleasure of the Complaints Committee, which may relieve or replace an Investigator for any reason at any time.
- (f) **Investigator's Report.** Upon the completion of either a preliminary investigation or investigation, the Investigator shall report to the Complaints Committee in an Executive Session.
- (g) **Investigatory File.** The Ethics Director shall maintain a Confidential investigatory file in the Office of Ethics, Compliance and Oversight with the

assistance of the Investigator, if the Investigator is someone other than the Ethics Director.

- (h) **Special Ethics Counsel.** The Complaints Committee shall appoint a Special Ethics Counsel to present the matter before all divisions of the Commission. The Special Ethics Counsel shall be the Ethics Director, an attorney member of the Office of Ethics, Compliance and Oversight, a member of the Office of General Counsel, or a member of The Florida Bar appointed by the Complaints Committee. The Special Ethics Counsel represents the Commission in its prosecutorial function. The Office of General Counsel liaison to the Commission may serve as Special Ethics Counsel only if the General Counsel assigns another lawyer to advise the Hearing Panel during the public hearing.

Rule 11 – Procedure Leading to Probable Cause

- (a) **Commission to Vote.** Unless a Complaint is otherwise resolved by the Complaints Committee, the Commission shall conduct an Executive Session for a final vote on whether there is Probable Cause to move forward on an alleged violation pursuant to a Complaint. The Respondent shall have a right to be heard at the Executive Session before the vote of the Commission is taken. At the Executive Session, Respondent may be represented, accompanied and/or advised by counsel.

- (b) **Probable Cause Determination.**

- (1) **Notification of Completion of Investigation.** When the Investigator's report is completed, the Office of Ethics, Compliance and Oversight shall notify the Respondent that the report is completed and shall send to the Respondent a copy of the investigation report. The investigatory file and Complaint file shall be open for inspection by the Respondent and the Respondent's counsel, and copies may be obtained at no more than cost.

- (2) **Time to Review Report.** Within fourteen days from the date of transmittal of the Investigator's report, the Respondent may file with the Office of Ethics, Compliance and Oversight a written response to the Investigator's report, which may include a proposal to settle or otherwise resolve the matter pursuant to Rule 17.

- (3) **Special Ethics Counsel's Recommendation.** The Special Ethics Counsel shall review the Investigator's report and shall make a written recommendation to the Complaints Committee for the disposition of the

Complaint. If the Special Ethics Counsel recommends that a public hearing be held, the recommendation shall include a statement of what charges shall be at issue at the hearing. A copy of the recommendation shall be furnished to the Respondent. Within fourteen days from the date of transmittal of the Special Ethics Counsel's recommendation, the Respondent may file with the Office of Ethics, Compliance and Oversight a written response to the recommendation.

(4) **Review Hearing.** The Complaints Committee shall meet in Executive Session to review the Investigator's report, Special Ethics Counsel's recommendation, and any responses. At this review hearing, the Complaints Committee may (A) continue its determination to allow further investigation; (B) issue a written order dismissing the Complaint if it finds no Probable Cause to believe that a violation of the Code has occurred, concluding the matter before the Commission; (C) refer the Complaint to the full Commission (with or without a recommendation) to determine Probable Cause; or (D) take such other action as it deems necessary to resolve the Complaint, consistent with due process of law.

(5) **Probable Cause Hearing.** If the Complaints Committee refers the Complaint to the full Commission to determine Probable Cause, the Commission shall consider the Complaint in Executive Session. The Respondent, the Complainant(s), their respective counsel, and the Special Ethics Counsel shall be permitted to attend the Probable Cause hearing before the Commission. Notice of the hearing shall be sent to the Respondent, Complainant(s), and Special Ethics Counsel at least fourteen days before the hearing.

(6) **Scope of Probable Cause Determination.** The Probable Cause determination is made by simple majority vote of the full Commission at the conclusion of the preliminary investigation of the Complaint and the conclusion of all proceedings before the Complaints Committee. The Respondent and the Special Ethics Counsel shall be permitted to make brief oral arguments to the Commission before a finding of Probable Cause.

(7) **Probable Cause Hearing Outcomes.** At its meeting to determine Probable Cause, the Commission may: (A) continue its determination to allow further investigation; (B) issue a written order dismissing the Complaint if it finds no Probable Cause to believe that a violation of the Code has occurred, concluding the matter before the Commission; (C) refer the Complaint for a final, public hearing before the Hearing Panel pursuant to Rule 11(c); or (D) take such other action as it deems necessary to resolve the Complaint, consistent with due process of law.

(8) **Consideration for Probable Cause Determination.** The Commission's determination shall be based upon the Investigator's report, the Special Ethics Counsel's recommendation, the Complaint, other evidence or statements received from any participant at least seven days before the Probable Cause Hearing, and staff recommendations, as well as any oral arguments made at the hearing. No testimony or other evidence will be accepted at the hearing. In making its determination, the Commission may consider:

(A) The sufficiency of the evidence against the Respondent, as contained in the record;

(B) The admissions and other stipulations of the Respondent, if any;

(C) The nature and circumstances of the Respondent's actions;

(D) The expense of further proceedings; and

(E) Such other factors as it deems material to its decision.

(c) **Finding of Probable Cause.** If the Commission votes in the affirmative that there is Probable Cause to proceed, the Commission shall determine what charges shall be at issue for the hearing and the matter shall then proceed in accordance with these Procedures to a Public Hearing before the Hearing Panel.

Rule 12 – Public Hearing Procedures

(a) Counsel at the Public Hearing

(1) **Respondent.** Respondent may appear on his or her own behalf or may be represented by a lawyer. Subsequent to initial transmittal of the Complaint, all notices and communications to a Respondent represented by a lawyer shall be made through the Respondent's lawyer.

(2) **Complainant.** To the limited extent the Complainant is entitled to participate or observe Commission proceedings, the Complainant may be represented by legal counsel. All notices and communications to a Complainant represented by a lawyer shall be made through Complainant's lawyer.

(b) **Motions to Dismiss for Lack of Jurisdiction.** Within a reasonable time before a public hearing is to be held, Respondent may file with the Office of Ethics, Compliance and Oversight a written motion to dismiss the Complaint for lack of

jurisdiction, which motion shall state with particularity the grounds therefore. The Respondent shall simultaneously transmit a copy of any such motion to the Special Ethics Counsel. The presiding division shall meet to consider and resolve the motion to dismiss. If the presiding division finds that the Commission has jurisdiction over matters alleged in the Complaint, it shall deny Respondent's motion with respect to those allegations and shall continue its proceedings. If the presiding division finds that the Commission has no jurisdiction over matters alleged in the Complaint, it shall issue a written decision ordering the dismissal of the Complaint with respect to those allegations. The Special Ethics Counsel and Respondent may attend and provide oral argument at any meeting at which a division of the Commission will vote to resolve a motion to dismiss under Rule 12(b). A motion under Rule 12(b) does not operate to stay any proceedings before the Commission, any division, or a Hearing Officer.

- (c) **Notification of Manner of Disposition.** Upon the Hearing Panel's ordering a public hearing of a Complaint, the Office of Ethics, Compliance and Oversight shall transmit the Hearing Panel's scheduling order, which shall include the deadline for filing a motion to dismiss, to the Special Ethics Counsel, Complainant, and Respondent.
- (d) **Parties to Public Hearings.** The person against whom the Commission has found Probable Cause shall be the Respondent. Respondent shall be the only party unless consolidation of Complaints is granted. The Special Ethics Counsel shall be a full participant in the proceeding and shall present all the evidence relevant to the cause that was produced by the preliminary investigation and such additional evidence as may be obtained through further investigation.
- (e) **Public Hearing Procedures.**

(1) **Presentation of the case.** The Special Ethics Counsel shall present his or her case first. Respondent or his or her counsel may then present his or her case. Each member of the Hearing Panel may ask questions of any person presenting a case and of any witness, including the Respondent. Rebuttal evidence may be permitted in the discretion of the Hearing Panel. Either the Special Ethics Counsel or the Respondent may ask, for good cause shown, that the hearing be recessed for further proceedings in the event that such are indicated, and such recess may be granted in the discretion of the Presiding Officer.

(2) **Opening and closing statements.** Opening and closing statements may be presented by the Special Ethics Counsel and the Respondent or his or her

counsel. The Special Ethics Counsel shall proceed first, followed by the Respondent. The Special Ethics Counsel may make a rebuttal closing statement.

(3) **Evidence.** Stipulations may be received and are encouraged as to uncontested issues. Oral evidence may be taken only on oath or affirmation. The Respondent and the Special Ethics Counsel shall have the right to present relevant evidence, to cross-examine witnesses within the scope of their direct testimony, and to impeach any witness on non-collateral matters regardless of which participant first called the witness to testify. Any relevant evidence may be admitted, and the hearing shall not be conducted according to technical rules relating to evidence or witnesses. Hearsay evidence may be used to supplement or explain other evidence, but only to the extent the Presiding Officer determines the hearsay to be reliable. The rules as to attorney-client or other privileges shall be effective to the same extent that they appear in the Florida Evidence Code. Irrelevant or cumulative evidence may be excluded at the discretion of the Presiding Officer. Affidavits shall generally not be admissible, but may be admitted for such weight as is reasonable if the affiant refuses or is unavailable to testify as defined in the Florida Evidence Code. Any relevant evidence regarding an admission made by the Respondent outside of the public hearing, if such evidence is given by a person with personal knowledge of the statement, is not hearsay and shall be admitted. The rule of sequestration of witnesses may be invoked by the Presiding Officer in his or her discretion, on his or her own motion or at the request of any participant.

(4) **Recording of the proceedings.** The proceedings at a public hearing shall be recorded by electronic means in the same manner that all public meetings of the Commission are recorded. No transcript shall ordinarily be prepared unless requested and paid for in advance by the Respondent. Nothing in these Procedures shall be construed to prevent the Respondent from providing a court reporter for a public hearing at his or her own expense.

(5) **Scheduling Order.** At the discretion of the Presiding Officer, the scheduling order may include allocated time for each participant, as well as other matters.

(f) Referral to Hearing Officer.

(1) The Hearing Panel may, in its discretion and by majority vote, appoint a Hearing Officer and refer to such Hearing Officer any evidentiary or non-evidentiary matter relative to a Complaint. The Hearing Officer may conduct such proceedings as he or she deems appropriate and shall follow all Procedures that

would apply if the Hearing Panel handled the referred matter, including (without limitation) Rule 14, except that a Hearing Officer does not have authority to consider resolutions pursuant to Rule 17.

(2) In proceedings before a Hearing Officer, the Hearing Officer acts as Presiding Officer and Hearing Panel, and the Hearing Officer shall submit a report and recommendation to the Hearing Panel on each dispositive matter within the Hearing Officer's referral. If a Complaint is referred to a Hearing Officer to handle the Public Hearing and recommend a final disposition of the Complaint, the Hearing Officer shall submit his or her report to the Hearing Panel within thirty days after the conclusion of the hearing or within such extended period of time as may be allowed by the Presiding Officer of the Hearing Panel. The Hearing Officer's report regarding recommendation of final disposition shall include: (A) findings of fact as to each violation of the Code of which the Commission found Probable Cause; (B) recommendations as to whether the Respondent should be found in violation of the Code, justifying disciplinary measures; (C) recommendations as to the disciplinary measures and/or civil fines to be imposed by the Hearing Panel; (D) a statement of any past disciplinary measures as to the Respondent that are on record with the Office of Ethics, Compliance and Oversight or that otherwise become known to the Hearing Officer through evidence during the course of the proceedings; and (E) a statement of costs incurred and recommendations as to the manner in which such costs should be taxed, if authorized by the Code.

(3) The Presiding Officer of the Hearing Panel shall review non-dispositive reports and recommendations from Hearing Officers. The full Commission shall review dispositive reports and recommendations from Hearing Officers. The Commission shall not reject or modify findings of fact made by a Hearing Officer unless a review of the entire record demonstrates that the findings were not based on competent, substantial evidence or that the proceedings on which the findings were based did not comply with the essential requirements of law. The Commission shall review legal conclusions and recommendations of discipline without deference (as if deciding the matter for the first time). In the discretion of the Presiding Officer of the Hearing Panel, the Commission may allow presentation of argument, written or oral. No additional evidence may be submitted after the conclusion of the Public Hearing before the Hearing Officer. Upon receipt of a Hearing Officer's report, the Presiding Officer of the Hearing Panel shall schedule a public hearing before the Commission to consider whether to adopt, modify, or reject, in whole or in part, the Hearing Officer's report and recommendations as the Public Report of the Commission. In the notice scheduling that public hearing, the Presiding Officer of the Hearing Panel shall

indicate what additional argument the Commission will consider (if any) and set deadlines for written submissions (if allowed).

(4) Where a Complaint is decided by the Hearing Panel without referral to a Hearing Officer, the Hearing Panel's (A) non-dispositive decisions and (B) decision finding no violation of the Code, are not reviewable by the full Commission except as allowed by Rule 17(b). If the Hearing Panel rules that an existing Code provision has been violated based on Clear and Convincing Evidence, the Hearing Panel shall prepare a report and recommendation to the full Commission the same way that a Hearing Officer would under Rule 12(f)(2). The Commission shall review the Hearing Panel's report the same way it would a Hearing Officer's report under Rule 12(f)(3).

(g) **Transmittal of Public Report.** Following the conclusion of the hearing, a public report shall be drafted and agreed upon by a majority of the Hearing Panel or Commission (as appropriate). Any member not in the majority may draft and file a dissent, or may simply note that he or she dissents. The public report shall be signed by the Presiding Officer, shall be transmitted to the Respondent, Special Ethics Counsel, and Complainant, and shall be made available to the public. Both the Respondent and the Special Ethics Counsel may, at the discretion and within such time designated by the Presiding Officer, present written proposed public reports to assist the Commission in its deliberations and preparation of the public report.

Rule 13 – Confidentiality

(a) **Proceedings Confidential.** Except as otherwise provided in these Procedures or by law, the Complaint and Commission activities, proceedings, and documents relating to the Complaint shall be confidential until either:

- (1) Confidentiality is waived in writing by the Respondent; or
- (2) The Complaints Committee orders the Complaint dismissed; or
- (3) The Complaints Committee makes a finding of Probable Cause.

When (1), (2), or (3) occurs, all materials relating to the Complaint shall become public records available to the public as provided in Chapter 119, Florida Statutes, except to the extent the materials are otherwise exempted from disclosure by law or court order.

(b) **Communication to Parties.** The Confidentiality provided by this rule shall not prohibit the Commission or the Office of Ethics, Compliance and Oversight from

advising the Respondent, Special Ethics Counsel, or Complainant about the status of the Complaint proceeding.

Rule 14 – Disqualification of Commission Members.

- (a) **Disqualification in General.** Commission members shall be disqualified from sitting as a member of the Commission at either the Probable Cause hearing or the final public hearing for bias, prejudice, or conflict of interest. Disqualification may be raised by the Complainant, Respondent, Special Ethics Counsel or by any member or advisor of the Commission.
- (b) **Time limitation.** Unless good cause is shown, all motions for disqualification shall be filed with the Office of Ethics, Compliance and Oversight at least five days prior to the hearing at which the member is expected to participate. The motion shall be accompanied by a sworn affidavit stating the particular facts and reasons for disqualification.
- (c) **Standard.** The motion shall be ruled on by the Commission member whose disqualification is sought (after consultation with the Office of General Counsel liaison to the Commission) and, unless the motion is denied as untimely, the ruling shall be based on whether the motion and affidavit establish that (1) the Commission member is in fact not fair or impartial in the case or (2) a Florida Statute, Code provision, or other applicable law requires the Commission member's disqualification. In ruling on the motion to disqualify, the Commission member may consider the truth of the facts alleged in support of the motion.
- (d) **Automatic Disqualification.** Any member of the Commission shall recuse him or herself on his or her own motion on all matters relating to a Complaint pending against the person who appointed him or her to the Commission, or against any particular member of a collegial body who appointed him or her, or against any relative by blood or marriage as defined in Fla. Stat. § 112.3135(1)(d) or against any persons with whom the member does business within the meaning of Fla. Stat. § 112.313(3), or with whom the member has an employment or contractual relationship within the meaning of Fla. Stat. § 112.313(7).

Rule 15 – Ex Parte Communications.

- (a) **Ex Parte Communications Disfavored.** A Commission member who is not acting as Investigator or Special Ethics Counsel shall not initiate nor consider any Ex Parte Communication relative to the merits of a pending Complaint that would be required to be disclosed pursuant to Rule 15(b).

- (b) **Ex Parte Disclosure.** A Commission member shall disclose Ex Parte Communications received from any of the following: (1) A public employee or official engaged in prosecution (including the Special Ethics Counsel) or advocacy in connection with the matter; or (2) A party to the proceeding or any person who, directly or indirectly, would have a substantial interest in the proposed action of the Commission, or his or her counsel; or (3) A Complainant or any other individual who has personal knowledge of the facts underlying the proceeding, or his or her counsel; or (4) An elected official.
- (c) **Procedure on Receipt of an Ex Parte Communication.** A Commission member who receives such an Ex Parte Communication shall place on the record of the matter all written communications received, or a memorandum stating the substance of all oral communications received, and shall also advise all parties that such matters have been placed on the record. Any participant, including the Ethics Director, desiring to rebut the Ex Parte Communication shall be allowed to do so, if a request for the opportunity for rebuttal is made within ten days after notice of the communication.

Rule 16 – Formal Actions.

In order to issue public censures or recommend disciplinary action, the Commission must have ruled that an existing Code provision has been violated based on Clear and Convincing Evidence.

Rule 17 – Dismissal of Violation; Resolution.

- (a) The Complaints Committee (prior to a finding of Probable Cause) or the Hearing Panel (after the Commission finds Probable Cause)—but not a Hearing Officer—may, at their discretion and at any stage within their respective processes:
- (1) Dismiss a Complaint upon determining that the public interest would not be served by proceeding further; or
 - (2) Dismiss a Complaint and issue a letter of instruction to the Respondent when it appears that the alleged violation was inadvertent, unintentional or insubstantial; or
 - (3) Dismiss a Complaint in accordance with a request from the State Attorney, U.S. Attorney or other state or municipal agency; or

- (4) Enter into a settlement or resolution of the issues which may include an apology, a stipulated fine, or other action. Such settlements and the reasons for entering into one, shall be made in writing and be a public record; or
 - (5) Dismiss or suspend a Complaint if the more appropriate jurisdiction to investigate and process the Complaint is the Florida Commission on Ethics.
- (b) In the presiding division's sole discretion, upon its own motion or the request of any participant, the presiding division may refer a decision to dismiss a Complaint under any of these Procedures to the full Commission for disposition rather than dismiss the Complaint within the division. When such a request is made by a participant and directed to the Complaints Committee, it shall have the same deadline as the Respondent's response to the Special Ethics Counsel's recommendation under Rule 11(b)(3). When such a request is made by a participant and directed to the Hearing Panel, it shall be made prior to the Hearing Panel's vote to dismiss the Complaint.

Flood Study Estimate - Engineering & Construction Costs

Location	Emilie	Optimist	Meyer	Joannes	Van Beaver	Sullivan (north)	Sullivan (Parking Lot)
----------	--------	----------	-------	---------	------------	------------------	------------------------

Phase 1 Engineering (Preliminary Study & Investigation)

Model & Survey Existing Floodway (\$10/LF)	\$ 23,900.00	\$ 7,000.00	\$ 4,850.00	\$ 2,700.00	\$ 9,250.00	\$ 4,150.00	\$ 2,350.00
Hydrologic & Hydraulic Study	\$ 20,000.00	\$ 20,000.00	\$ 20,000.00	\$ 20,000.00	\$ 20,000.00	\$ 20,000.00	\$ 20,000.00
Total Phase 1:	\$ 43,900.00	\$ 27,000.00	\$ 24,850.00	\$ 22,700.00	\$ 29,250.00	\$ 24,150.00	\$ 22,350.00

Phase 2 Engineering (Design & Permitting)

Storm Water Management	\$ 25,000.00	\$ 25,000.00	\$ 25,000.00	\$ 25,000.00	\$ 25,000.00	\$ 25,000.00	\$ 25,000.00
Trail Engineering	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00
FEMA Mapping	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00	\$ 10,000.00
Permitting/Mitigation	\$ 35,000.00	\$ 35,000.00	\$ 35,000.00	\$ 35,000.00	\$ 35,000.00	\$ 35,000.00	\$ 35,000.00
Total Phase 2:	\$ 80,000.00	\$ 80,000.00	\$ 80,000.00	\$ 80,000.00	\$ 80,000.00	\$ 80,000.00	\$ 80,000.00

Phase 3 Construction

Construction	\$ 180,000.00	\$ 52,500.00	\$ 36,375.00	\$ 20,250.00	\$ 69,375.00	\$ 31,125.00	\$ 17,475.00
Total Project Cost/Location (Phase 1 + Phase 2 + Phase 3):	\$ 303,900.00	\$ 159,500.00	\$ 141,225.00	\$ 122,950.00	\$ 178,625.00	\$ 135,275.00	\$ 119,825.00
Total Project Cost:	\$ 1,161,300.00						

Notes:

Phase 1 will be required for each location; if the study proves that additional design and construction is feasible, the total price for the work will be the sum of Phase 1 + Phase 2 + Phase 3.

Modeling & Survey prices are based on the assumption that an existing study has already been performed.

FEMA Re-Mapping will only be required if there is not a net zero change in elevation to the trail.

FEMA Mapping is charged approx. \$10,000 per site therefore could map all projects under one FEMA permit for total of \$10,000.

Report to the
Parks Committee
of the City of Green Bay

MEETING DATE

December 1, 2020

PREPARED BY

AGENDA ITEM # R.2

To accept a donation of light pole banners and up-lighting from the Whitney Park Neighborhood Association for installation at Whitney Park.

BACKGROUND

RECOMMENDATION

FISCAL IMPACT

ATTACHMENTS

- I. Grant Acceptance Request Whitney

November 10, 2020

City of Green Bay Parks Committee
100 N. Jefferson Street
Green Bay, WI 54301

Re: United Way Award & Acceptance Request

Dear Parks Committee Members:

I'm pleased to inform you that our Whitney Park Neighborhood Association (WPNA) has been awarded a \$10,000 grant by the United Way of Brown County! Our application sought funding for a variety of possible park improvement items like banners, trash receptacles, and more lighting at the park.

As originally discussed with both Parks Department and United Way staff, the ability to accept the award is dependent on your committee's acceptance of the funding and to allow WPNA and Parks Department to determine which items to purchase—which I ask that you all approve at your next meeting.

After the grant announcement, I met with staff from the city's Parks Department and Olde Main Street, Inc. at Whitney Park to discuss the best way of allocating the grant dollars. Our determination was that banners and lighting are the most impactful and efficient use of the grant; we'll proceed with ordering those items through *Green Bay Neighborhoods* (our fiscal agent) upon your affirmative vote. Our three parties will also enter into a maintenance agreement to address future maintenance responsibilities.

We ask that Parks Committee also approve that city staff install the banners and lighting after they are purchased and received next spring. (Both the banners and lights attach to the new lightposts that were installed this past February). Imagery of the lighting and banner items are included in this packet.

Thank you in advance as we all continue to make Whitney Park an even better part of Green Bay!

Sincerely,

A handwritten signature in blue ink, appearing to read "Garritt R. Bader".

Garritt R. Bader
President, Whitney Park Neighborhood Association

To: Chuckel, Jesse <JChuckel@holophane.com>
Subject: RE: Green Bay Lighting Project Follow-Up

We've been working on this idea for several months already, and I contacted Holophane to ask about costs for banner arms, planters and lighting

Thanks Jesse. Is there a way to generate an early estimate on the following?

1. 14 Standard banner arms (2 banners for each of the 7 posts), 12" length, with "ball" finial?
 1. If we wanted to do a banner on one side and a planter on the other, is that possible?
2. Uplighting: Pine LED 4,000 lumens, either...
 1. 4 Post mount PM60A or PM60C (assuming these can be mounted to the posts vs. a wall)
 2. 3 EA-extended arms

Garritt,

Glad to hear it turned out well. Here is a [link](#) to our landscape lighting that would be suitable for lighting the trees. I am attaching a spec sheet on the banner arms for your review.

Specifications

FEATURES:

Tool-less banner installation and/or replacement. As a safety feature the break-away couplings are fitted with 3/32Ø 7x7 strand stainless steel aircraft cable.

DESCRIPTION

The banner arms shall consist of an aluminum 6061 schedule 80 pipe or aluminum extrusion, an aluminum channel mounting plate, and a cast aluminum coupling. Stainless steel eyebolts, scrolls, and breakaway banner arms are optional. Breakaway banner arms may be recommended for some types of banners.

CONSTRUCTION

The banner arm shall be installed into a cast aluminum coupling with a stainless steel latch-pin.

MATERIALS

The finial shall be cast aluminum, produced from certified ASTM 356 ingot per ASTM B-179-95a or ASTM B26-95 and welded to the end of the banner arm. The banner arm mounting plate shall be aluminum, ASTM 356 alloy, heat treated to a T6 temper. All hardware shall be stainless steel.

INSTALLATION

Bolt the cast aluminum coupling to the mounting channel (welded to the side of the pole) using 3/8-16 stainless screws. Slip the banner arm into the coupling and secure in place with 1/4" stainless steel latch pin. Note: Arms are not designed for pedestrian interference. Banners to be provided by others.

DIMENSIONS

The banner arms shall be available in 1.05", 1.32", 1.66" or 1.9" O.D. with length to be specified in whole inch increments.

***CAUTION**

**EYE BOLT LOAD LIMIT
= 100 LB MAXIMUM**

ORDERING GUIDE

Banner arms can add substantial wind loading to the post you select. Please coordinate the correct post size and style with the factory.

of the City of Green Bay

MEETING DATE

December 1, 2020

PREPARED BY

Dave Hansen, Traffic Engineer

AGENDA ITEM # S.I

To refer to staff the request to install a marked crosswalk across East Mason Street at Goodell Street.

BACKGROUND

Two years ago, a similar request to relocate the Hartung St crossing to Goodell St was heard and was received and placed on file. This request is different in that there is no proposal to change the Mason-Hartung intersection.

AGENDA ITEM # S.2

To postpone to the January 2021 meeting of the Traffic, Bicycle, and Pedestrian Commission the request by Ald. Lefebvre to review and potentially change the SPEED LIMIT 25 zone on North Webster Avenue from Pine Street to University Avenue.

BACKGROUND

Recently, the speed limit changed from 25 mph to 35 mph along N Webster Ave between University Ave and Klaus St. This request would effectively extend the 35 mph speed zone south to Pine St.

RECOMMENDATION

Refer to staff for study.

MEMORANDUM

Department of Public Works | Traffic Division

To: Traffic, Bicycle, and Pedestrian Commission (TBPC)
Public Works Director Steven Grenier, P.E.

From: Traffic Engineer David J.A. Hansen, P.E., PTOE

Re: **All-Way Stop Control Warrant Analysis, Western Avenue at Maryhill Drive**

Date: Friday, October 16, 2020

This memorandum serves as my response to the Traffic, Bicycle, and Pedestrian Commission (TBPC) motion to refer to staff the request by Ald. Wery to establish a 3-WAY STOP condition at Western Avenue and Maryhill Drive. (Ald. Wery – District 8).

This memo will be presented at the Mon Oct 19, 2020 TBPC meeting.

Existing Site Conditions

The intersection of Western Ave and Maryhill Dr is located on the west side of the City of Green Bay, in Aldermanic District 8 (Ald. Wery). See Figure 1 for General Location, Figures 2a-2c for Neighborhood Views.

Figure 1 – General Location

Figure 2a – Neighborhood View

Figure 2b – Neighborhood View

Figure 2c – Neighborhood View

Figure 3 – Intersection View

The intersection of Western Ave and Maryhill Dr operates under 1-WAY STOP condition; Maryhill Dr (northbound) traffic stops for Western Ave (eastbound and westbound) traffic. It is a three-approach intersection, or "T-intersection". Two blocks south of the intersection is the southern terminus of Maryhill Dr and is a 1-WAY STOP condition where Maryhill Dr (southbound) traffic stops for W Mason St (eastbound and westbound) traffic.

Western Ave is an urban local street which functions as a collector street. Single family residential homes abut the roadway, east, west, and south of Maryhill Dr with two nearby apartment complexes. Two schools are near and south of the intersection: Notre Dame Academy and Franklin Middle School. Due to the pandemic, no school traffic was collected.

Western Ave has an asphaltic surface. Roadway width is 36 ft wide. It consists of 1 travel lane in each direction and parking lanes on both sides of the street. Parking is regulated on both sides of Western Ave both east and west of Maryhill Dr with 2-hour maximum, 7 AM and 4 PM on school days. The south side of Western Ave has 2 NO PARKING HERE TO CORNER zones in order to keep the intersection sight lines open to view oncoming traffic. The posted speed limit is 25 mph. Sidewalk exists along both sides of Western Ave. No centerline or lane line markings exist except for 540 ft of double yellow centerline west of the intersection due to the crest vertical curve. Street lighting exists along Western Ave and at the intersection with Maryhill Dr. No marked crosswalks exist at the intersection. Two unmarked crosswalks exist (one south leg, one east leg).

Maryhill Dr is an urban local street. Single family and multifamily residential homes exist south of the intersection. Maryhill Dr has an asphaltic surface and consists of 1 travel lane in each direction and parking lanes on both sides of the street. Clear roadway width is 36 ft. The posted speed limit is 25 mph. Sidewalk exists along both sides of Maryhill Dr. No centerline or lane line markings exist. SCHOOL word marking exists south of the intersection in the southbound direction. Street lighting exists along Maryhill Dr. Parking is regulated on both sides of Maryhill Dr with 2-hour maximum, 7 AM and 4 PM on school days. The east side of Maryhill Dr at Western Ave has a NO PARKING HERE TO CORNER zones in order to keep the intersection sight lines open to view cross traffic.

Stopping sight distance (SSD) for both streets is 155 ft based on the posted speed limit of 25 mph. In-field SSD is 365 ft, more than the minimum required. No Green Bay Metro Transit bus routes or stops exist near the intersection. No STOP AHEAD warning signs exist on Maryhill Dr approaching the intersection. See Figures 3a through 3d for photos of the intersection.

Figure 3a – Eastbound Western Ave approaching Maryhill Dr looking East

Figure 3b – Westbound Western Ave approaching Maryhill Dr looking West

Figure 3c – Northbound Western Ave at Maryhill Dr looking West

Figure 3d – Northbound Western Ave at Maryhill Dr looking East

Crash History

No crashes have occurred at the intersection in the past 5 years.

Vehicle and Pedestrian Traffic

Weekday vehicle volumes collected from Tue Sep 1 through Tue Sep 8, 2020 are summarized in Table 1. No pedestrian or bike counts were collected as part of this study.

Multi-Way Stop Application Warrant Analysis

A multi-way STOP application study for the intersection can be found in Figure 5. All warrants as defined in the current editions of the Federal and State Manual on Uniform Traffic Control Devices (MUTCD) were evaluated.

Figure 5 - Multi-Way Stop Application Warrant Analysis

MULTI-WAY STOP SIGN WARRANTS

LOCATION: Western Ave at Maryhill Dr

DATE: Wed Sep 23, 2020

WARRANT
MET ?

1. Are traffic signals warranted/justified?
(Multi-way STOP is an interim measure while signals are being designed and constructed) No
2. Have there been 5 or more reported crashes in a 12-month period that are susceptible to correction by a multi-way STOP installation?
(4 crashes using 80% criteria) No
- 3.(a) 8-hour traffic volumes on the Major Street (total of both approaches)

	TIME	TOTAL VEHICLES Major Street	100% WARRANT REQUIREMENT	80% WARRANT REQUIREMENT	WARRANT MET ?
1	4:00 PM	225	300	240	No
2	2:00 PM	223	300	240	No
3	3:00 PM	217	300	240	No
4	12:00 PM	198	300	240	No
5	1:00 PM	194	300	240	No
6	11:00 AM	178	300	240	No
7	5:00 PM	174	300	240	No
8	6:00 PM	162	300	240	No

- 3.(b) Same 8-hour traffic volumes on the Minor Street (combined vehicle, ped, and bike volume; total of both approaches)

	TIME	TOTAL VEHICLES Minor Street	100% WARRANT REQUIREMENT	80% WARRANT REQUIREMENT	WARRANT MET ?
1	4:00 PM	26	200	160	No
2	2:00 PM	20	200	160	No
3	3:00 PM	27	200	160	No
4	12:00 PM	20	200	160	No
5	1:00 PM	15	200	160	No
6	11:00 AM	16	200	160	No
7	5:00 PM	22	200	160	No
8	6:00 PM	14	200	160	No

- 3.(c) If 85th-percentile speed exceeds 40 mph, are Items 3a & 3b met when volumes are 70% of their value?

n/a

4. Where no single criterion is satisfied, are Criteria 2, 3a, and 3b all satisfied to 80% of the minimum values?

No

Other criteria considered included:

- A. The need to control left-turn conflicts: NO
- B. The need to control vehicle/pedestrian conflicts near locations that generate high pedestrian volumes: NO
- C. Locations where a road user, after stopping, cannot see conflicting traffic and is not able to negotiate the intersection unless conflicting cross traffic is also required to stop: NO
- D. An intersection of two residential neighborhood collector (through) streets of similar design and operating characteristics where multi-way stop control would improve traffic operational characteristics of the intersection: NO

Discussion

Sixteen years ago, a multi-way STOP warrant study was conducted by DPW at this intersection. Staff presented the report to the Traffic Commission on October 25, 2004. Based on objective data and field review at the time, staff did not recommend the installation of a multi-way STOP condition. Traffic Commission ultimately denied the multi-way STOP request.

In review of the 5-year crash history, no crashes means that a safe traffic environment exists today. Adding a STOP condition on Western Ave will most likely add crashes, specifically rear-end crashes.

MUTCD Section 2B.04, Right-of-Way at Intersections, states that "YIELD or STOP signs should not be used for speed control". If concerned residents are requesting the STOP condition on Western Ave to reduce motorist speed, DPW maintains the position of the FHWA and WisDOT by not recommending installing STOP signs for speed control.

Referring to a comprehensive study conducted by W. Martin Bretherton Jr., P.E. (Georgia), a member of the Institute of Transportation Engineers (ITE), entitled " Multi-Way Stops - The Research Shows the MUTCD is Correct!" which concluded that:

1. Multi-way stops do not control speeds
2. Stop compliance is poor at unwarranted multi-way stop signs
3. Before-After studies show multi-way stop signs do not reduce speeds on residential streets
4. Unwarranted multi-way stops increased speed some distance from intersections (the studies hypothesizing that motorists are making up the time they lost at the "unnecessary" stop sign)
5. Multi-way stop signs have high operating costs based on vehicle operating costs,

vehicular travel times, fuel consumption and increased vehicle emissions

6. Safety of pedestrians is decreased at unwarranted multi-way stops, especially small children (it seems that pedestrians expect vehicles to stop at the stop signs but many vehicles have gotten in the habit of running the "unnecessary" stop sign)
7. Stop signs increase noise in the vicinity of an intersection. The noise is created by the vehicle braking noise at the intersection and the cars accelerating up to speed.

Conclusions

No multi-way stop warrants were met. The Western Ave and Maryhill Dr multi-way STOP warrant study resulted in a recommendation to continue operating the intersection as a 1-WAY STOP condition where Maryhill Dr traffic stops for Western Ave traffic.

Recommendations

1. To deny the request to establish a 3-WAY STOP condition at Western Avenue at Maryhill Drive.
2. To maintain the existing 1-WAY STOP control (Maryhill Dr traffic stops for Western Ave traffic)

Report to the
Economic Development Authority
of the City of Green Bay

MEETING DATE

December 1, 2020

PREPARED BY

Matt Buchanan, Staff

AGENDA ITEM # T.I

To enter into professional services agreements with GEI Consulting to serve as the primary qualified environmental professional (QEP) and Stantec to serve as secondary QEP for Brownfields Revolving Loan Fund (RLF).

The Council may convene in closed session pursuant to Sections 19.85(1)(e), Wis. Stats., for purposes of deliberating or negotiating the sale of public properties, investing of public funds or conducting other specified public business as necessary for competitive or bargaining reasons. The Council may thereafter reconvene in open session pursuant to Section 19.85(2), Wis. Stats., to report the results of the closed session and consider the balance of the agenda.

BACKGROUND

The City of Green Bay was recently awarded an \$800,000 Brownfields Revolving Loan Fund (RLF) Grant from the U.S. Environmental Protection Agency (EPA). To implement the new RLF program, the City must contract with a qualified environmental professional (QEP) to assist staff with overseeing brownfield cleanup activities and ensuring compliance with state and federal requirements.

The City of Green Bay's Purchasing Division coordinated a Request for Proposals (RFP) and two qualified vendors responded with formal submissions. An internal evaluation team scored the proposals based on the attached scoring criteria. The evaluation process resulted in Vendor A, GEI Consultants, receiving the highest score and Vendor B, Stantec, receiving the second highest score.

EPA has guided staff to contract with two vendors to serve as primary and secondary QEPs in order to avoid potential conflicts of interest. In cases when the City's primary QEP is also under contract to consult an RLF applicant or borrower, the City may rely on a secondary QEP for oversight of those projects.

RECOMMENDATION

Staff is recommending authorization to enter into professional services agreements with GEI Consulting to serve as the primary QEP and Stantec to serve as secondary QEP.

FISCAL IMPACT

The Brownfields RLF Grant budget includes \$45,200 for contractual services. QEPs will invoice the City for services provided at an hourly rate, not to exceed the EPA-approved budget for contractual services.

ATTACHMENTS

- I. RFP #3276 Intent to Award Notice

October 28, 2020

RE: RFP No. 3276
Department of Community & Economic Development
Project: Professional Environmental Services for
Brownfields Revolving Loan Fund (RLF)

The evaluations of the proposals received have been completed. The award recommendation of the highest ranked proposal for the following project will be as follows:

- 1) Professional Environmental Services for Brownfields Revolving Loan Fund (RLF) - Award to GEI Consultants, Inc. as the Primary Qualified Environmental Professional (QEP) Vendor. Stantec has been selected as the Secondary QEP Vendor to assist only when GEI Consultants, Inc. is unable to conduct the QEP services. Budget total for this project not to exceed \$45,200.

A copy of the proposal summary is attached. This recommendation will be brought for approval before the Economic Development Authority on November 2, 2020 at 5:00pm (Central Time).

These meetings will be held virtually. Please confirm the date and time via the City of Green Bay's website www.greenbaywi.gov. Click on the "Meetings & Agendas / Minutes" icon at the bottom of the screen. Select the appropriate meeting (Economic Development Authority) and view the directions on how to attend the virtual meeting. A copy of the proposal summary is attached.

Thank you for your time and effort on your proposal you submitted and also for your continued interest in doing business with the City of Green Bay. If you have any questions, or require additional information, please feel free to contact me at 920-448-3049.

Sincerely,

Jackie Krawze, CPPB
Buyer

NOTES:

This was a proposal process with a budget amount not to exceed **\$45,200**. We received two (2) proposals.

The evaluation team consisted of the Department of Community and Economic Development Staff (3 members).

This proposal process started in September 2020. Proposals were due on 10/19/2020. On 10/26/2020 the evaluation team met to discuss & score all proposals.

Award Recommendations:

Award to GEI Consultants, Inc. as the Primary Qualified Environmental Professional (QEP) Vendor. Stantec has been selected as the Secondary QEP Vendor to assist only when GEI Consultants, Inc. is unable to conduct the QEP services. Budget total for this project not to exceed \$45,200.

Before the Ethics Board of the City of Green Bay

In the Matter of the Complaint of a Code of Conduct Violation by Alder VanderLeest

Tarl Knight
Complainant

vs.

John S VanderLeest
Respondent

Report of Findings of Fact Conclusions of Law and Decision

The Ethics Board of the City of Green Bay, (Ethics Board) on the record described herein and having read all motions and supporting documentation and heard motions of the parties on October 7, 2020, with all members present, and having deliberated concerning those motions on October 28, 2020, and November 12, 2020, make the following:

Findings of Fact

Procedural Background and Motions:

1. On April 21, 2020, Tarl Knight filed with the City Clerk an untitled, verified document in which Mr. Knight states he is writing with a formal complaint against Alderman John S. VanderLeest (the "Complaint").
2. The Complaint alleges that several constituents have had their posts and comments deleted from Alder VanderLeest's Facebook site since 2016, and that those constituents are complaining about those deletions.
3. Mr. Knight states that the Supreme Court has confirmed social media as a modern public forum and states:

"Public officials may not retaliate against speech they dislike by suppressing expression on social media." and that

"The suppression of critical commentary regarding elected officials is the quintessential form of viewpoint discrimination against which the First Amendment guards."

4. Mr. Knight concludes that "Alderman VanderLeest's public Facebook account titled "Green Bay City Council - John S. VanderLeest" is, for all intents and purposes, a public forum. Citing Davis v Randall a 4th circuit case decided in January of 2019.
5. Mr. Knight implies that the conduct alleged violates the Green Bay Code of Conduct citing a portion of the introductory portion of Section 4, Elected Officials Conduct Toward the Public, of the City of Green Bay Code of Conduct for Elected Officials (the "Code of Conduct") as follows:

"No signs of partiality, prejudice, or disrespect should be evident on the part of individual Council members toward an individual participating in a public forum. Every effort should be made to be fair and impartial... The Council members are expected to demonstrate, both publicly and privately, their honesty and integrity, and to be an example of appropriate and ethical conduct. All Council members should convey to the public their respect and appreciation for the public's participation, input, and opinions."

6. Mr. Knight also alleges that the blocking of opposing points of view at public forums violates the City's social media property quoting, without citation a portion of § 24.3 of the City Personnel policies as follows:

"City social media sites shall adhere to applicable federal, state, and local laws. Tins includes any applicable open records requirements. Any content maintained in a social media format that is related to City business is public record. Content must be able to be managed, stored, and retrieved to comply with applicable laws."

* * *

7. Pursuant to Section 8 A of the Code of Conduct the City Clerk, determined that the Complaint was complete and forwarded it to the Ethics Board.
8. Pursuant to Section 8 D of the Code of Conduct, on July 9, 2020, the Ethics Board, issued a summons, signed by the City Clerk commanding Alder VanderLeest to appear before it.
9. The Summons and Complaint were received by Alder VanderLeest on July 13, 2020 (the Summons and Complaint are appended and incorporated as Exhibit A).

10. On July 20, 2020, Robert Miller, the Attorney for Alder VanderLeest filed a Motion for Postponement of Proceedings (that motion, is appended and incorporated as Exhibit B). In this motion he argues that the evidentiary hearing on this matter should be postponed for due process reasons, including to address standing and discovery.
11. The Board of Ethics convened this matter on July 22, 2020, setting August 6, 2020, as the date for the motions concerning standing and discovery and scheduled the matter to convene again on September 1, 2020.
12. On August 3, 2020, Mr. Miller filed a document entitled Argument with several attachments (the document and attachments are appended and incorporated as Exhibit C). Mr. Miller argues:
 - a. Alder VanderLeest's blocking of social media posts was because the posts contained offensive and insulting material;
 - b. Alder VanderLeest exercised his discretion in an objectively reasonable manner when he deleted those posts;
 - c. There was no violation of the City's social media policy because the Communications Decency Act provides that no user of interactive computer services can be held liable for restricting obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable material; and
 - d. There is a presumption of regularity for the acts of public officers.
13. During late July or early August, Mr. Miller filed an additional document entitled Argument with several attachments all of which are appended and incorporated as Exhibit D. In those documents he argues:
 - a. The Facebook page is a campaign page;
 - b. Alders have not been trained on the proper use of social media;
 - c. The Davison case is not binding;
 - d. SEC230 allows for removal of offensive material from social media sites; and
 - e. The Wisconsin Ethics Board's opinions are supportive of his arguments.
14. On August 13, 2020, Mr. Knight filed several screen shots in a packet of documents entitled "Citizens blocked or deleted by Mr. VanderLeest" (those documents are appended and incorporated as Exhibit E). The documents include:
 - a. Screen shots that contain some text alleging the authors were blocked from Alder VanderLeest's Facebook page;
 - b. The screen shots in this exhibit do not contain any obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable material; and
 - c. Mr. Knight's argument that the Facebook page that is the subject of his complaint is not a "campaign page".

15. On August 31, 2020, Mr. Miller filed a Motion to Specify Plaintiff's Claim with Particularity and Clarity (that document is appended and incorporated as Exhibit F). This motion asks Mr. Knight to explain how a certain case, cited by Mr. Knight applies to this matter.
16. On September 1, 2020, Mr. Knight filed an additional document entitled Argument (that document is appended and incorporated as Exhibit G). He argues:
 - a. With regard to standing, Section 8 of the City of Green Bay Code of Conduct allows any person who believes an elected official has violated a requirement, prohibition, or guideline set out in the Code of Conduct may file a Complaint;
 - b. Alder VanderLeest's conduct is violative of Section 4 and Section 1 of the Code of Conduct;
 - c. Blocking access to Alder VanderLeest's social media page is a violation of the first amendment; and
 - d. Blocking access to Alder VanderLeest's social media page is a violation of the City's social media policy.
17. The Ethics Board convened this matter on September 1, 2020, at which time the matter was formally scheduled for motions and witness and document exchange. The Ethics Board issued a scheduling order; a copy of the scheduling order is appended and incorporated as Exhibit H). The scheduling order also scheduled the hearing to reconvene on October 7, 2020.
18. On September 11, 2020, the parties exchanged witness and document lists (a copy of Mr. Knight's exchange is appended and incorporated as Exhibit I and Mr. Miller's exchange including 2 exhibits he intends to introduce, is appended and incorporated as Exhibit J).
19. On September 14, 2020, Mr. Miller submitted an affidavit from Rhonda Sitniakau (a copy of that document is appended and incorporated as Exhibit K).
20. On September 18, 2020, Mr. Miller filed a Motion to Dismiss (a copy of that document is appended and incorporated as Exhibit L). This motion stated 9 grounds for relief:
 - a. No applicable cases bar the respondent from deleting or restricting access to his website;
 - b. A charge regarding violation of the public meeting section (section 4 of the Code of Ethics);
 - c. The action should be dismissed because the operation of a website or Facebook page is not a public meeting;
 - d. The Ethics Board, by applying the public meeting standard, would essentially be re-writing the ordinance well beyond the plain meaning of its terms;

- e. Section 230 of the Communication Decency (previously cited in documents) preempts any action by state and local government against the sponsor/manager of a web site;
- f. VanderLeest arguably followed the current advice of the Wisconsin Ethics Board;
- g. VanderLeest and his colleagues were given no instruction on the use of social media;
- h. The City of Green Bay Personnel Policy cited in the complaint would not be applicable to an Alderman;
- i. The legislative action creating the Ethics Board neither adopted nor promulgated procedural and evidentiary rules for its proceedings; and
- j. The action should be dismissed because of its violation of the constitutional requirements for equal protection of the laws.

21. Also on September 18, 2020, Mr. Knight filed a Motion to Suppress the Affidavit filed by Mr. Miller (a copy of that document is appended and incorporated as Exhibit M). This motion objects to the admission of the affidavit on the basis of relevance and notes that he was not listed as a witness.

22. On September 28, 2020, Mr. Miller filed a Brief in support of Alder VanderLeest's Motion to Dismiss (a copy of that document and all attachments is appended and incorporated as Exhibit N). In the brief Mr. Miller makes the following arguments:

- a. The charge regarding violation of the public meeting (section 4 of the Code of Ethics) should be dismissed because the operation of a website or Facebook page is not a "public meeting" in the context of the Code of Ethics;
 - i. The specific definition at 19.82 (2), Wis. Stats.
 - ii. Plain meaning of "public meeting" does not include Facebook exchanges
 - iii. The rule of lenity works against the expansion of the meaning of public meeting to include Facebook exchanges
 - iv. Declaring that Facebook exchanges are public meetings will subject the City to thousands of open meetings violations
- b. The Ethics board is not empowered to legislate by re-writing city ordinances;
- c. Section e3 of the Communications Decency Act allows for the deletion of inappropriate materials from social media sites and pre-empts any state or local action; which is contrary to the act.
- d. There is no violation of any controlling rule of law;
- e. Complainant's motion to suppress has no application to this proceeding;

23. October 2, 2020, Mr. Knight filed a Motion to Suppress Alder VanderLeest's Motion to Dismiss (a copy of that document is appended and incorporated as Exhibit O). He argues that Alder VanderLeest's motion to dismiss should be denied

24. On October 7, 2020, the Ethics Board convened to hear oral argument on the pending motions and to commence deliberations. The Ethics Board, having heard arguments on all motions before the Board, adjourned deliberations until October 28, 2020.
25. On October 28, 2020, the Ethics Board met and deliberated in closed session. The Board directed their legal counsel to take actions related to their deliberations for consideration at their next meeting, scheduled for November 12, 2020.
26. On November 12, 2020, the Board met, deliberated further and issued this Findings of Fact, Conclusions of Law and Decision.

Jurisdiction and Authority

27. It is well established law that:

- a. Arms or departments of municipal governments such as municipal commissions have only those powers that are expressly granted by statute and those powers that are necessary to implement the expressed powers. § 2:40. Commissions, 1 McQuillin Mun. Corp. § 2:40 (3d ed.); and
 - b. as a creature of the legislature, the Board, like a municipal body, has such powers as are “expressly conferred upon [it] by the legislature or are necessarily implied from the powers conferred.” *Murphy v. Oconto Cty. Drainage Bd.*, 2016 WI App 34, ¶ 60, 369 Wis. 2d 71, 879 N.W.2d 808, 2016 WL 784887, at 18.
28. The Ethics Code provision of the Green Bay Code of Ordinances provides at Section 1.90(8)(b):

The jurisdiction of the ethics board is limited to acting within the scope of subsections (8)(d) and (9) of this section and conducting hearings regarding complaints filed in conformance with the code of conduct for elected officials as adopted by the common council and as amended from time to time.

29. The Code of Conduct provides:

SECTION 8: Enforcement of this Code of Conduct

A. Filing of Complaints

Any person who believes an Elected official, in his/her official capacity, has violated a requirement, prohibition, or guideline set out herein may file a sworn complaint with the City Clerk identifying (1) the complainant’s name, address and contact information; (2) the name and position of the City official who is the subject of the complaint; (3) the nature of the alleged violation, including the specific provision of this Code allegedly violated, and (4) a statement of facts

constituting the alleged violation and the dates on which, or period of time during which, the alleged violation occurred.

30. The creation of the Code of Conduct was motivated by the need for a civility code regarding the operations the Common Council and its members.
31. The Code of Conduct was adopted in September of 2015.
32. No provision in the Code of Conduct expressly addresses social media sites.
33. There is no provision of the Green Bay Code of Ordinances that gives the Ethics Board the authority to address constitutional violations.
34. §. 1.16. Coverage and Amendment of the City of Green Bay Personnel Policies provides in relevant part:
This document shall apply to personnel administration for all employees and departments of the City of Green Bay now and existing hereafter established except the following:
 - a. Members of the Green Bay City Council
35. The introductory paragraph of Section 4 of the Code of Conduct provides in its entirety:

SECTION 4: Elected Official Conduct Towards the Public

In Public Meetings

Making the public feel welcome is an important part of the democratic process. No signs of partiality, prejudice, or disrespect should be evident on the part of individual Council members toward an individual participating in a public forum. Every effort should be made to be fair and impartial in listening to public testimony. The Council members are expected to demonstrate, both publicly and privately, their honesty and integrity, and to be an example of appropriate and ethical conduct. All Council members should convey to the public their respect and appreciation for the public's participation, input, and opinions.

36. Interpreting Section 4 requires analysis of the effect of the heading "In Public Meetings" and the remainder.
37. Section 990.001(6) of the Wisconsin statutes provides:

(6) STATUTE TITLES AND HISTORY NOTES. The titles to subchapters, sections, subsections, paragraphs and subdivisions of the statutes and history notes are not part of the statutes.

38. While a heading is not part of the law, it can be persuasive in the interpretation given to the statute. *Pure Milk Prods. Coop. v. National Farmers Org.*, 64 Wis.2d 241, 253, 219 N.W.2d 564, 571 (1974).
39. The Code of Conduct is broken into 5 substantive sections addressing the conduct of elected officials with regard to:
- a. Conduct with other elected officials
 - b. Conduct with City Staff
 - c. Conduct with the Public
 - d. Conduct with Public Agencies
 - e. Conduct with the Media
40. The Section 4 is the Section of the Code of Conduct that is entitled Elected Official Conduct with the Public.
41. The provision of the Code of Conduct cited in part by Mr. Knight is under the heading "In Public Meetings".
42. The remainder of the language of the Code of Conduct under the heading "In Public Meetings" addresses the topics of welcoming speakers, allocating public hearing time, avoiding debate and following parliamentary procedure.
43. Section 4 also includes a heading "Outside Public Meetings" which does not address the use of the internet.
44. Pursuant to § 19.82(2) a meeting for purposes of the public meetings law, is "[t]he convening of members of a governmental body for the purpose of exercising the responsibilities, authority, power or duties delegated to or vested in the body".
45. The term public forum is in the body of the language of Section 4 of the Code of Conduct
46. The term public forum has many meanings including any meeting of the City Council, its boards, committees or commissions.
47. The cases cited by Mr. Knight have determined that social media sites can be public forums.
48. The cases cited by Mr. Knight were decided in 2019 and involve Twitter pages.
49. The reasoning of the cases cited by Mr. Knight has not been adopted in the Eastern District of Wisconsin or the courts of the state of Wisconsin, but has been cited with favor by the Western District of Wisconsin.

50. The Western District of Wisconsin also acknowledged that the law regarding social media as a public forum is not well established.
51. Due process requires notice that would reasonably inform a person of the conduct prohibited by a regulation, particularly one that imposes a sanction.
52. The Code of Conduct includes the possibility of the imposition of punitive sanctions.
53. The Code of Conduct does not contain the words social media, Facebook or Twitter.
54. The City of Green Bay Alders have not had any training on the proper use of the internet.

Conclusions of Law

- A. The Ethics Board has only the authority specifically provided for by ordinance or necessarily required by that expressed by ordinance.
- B. Reading the § 1.90(8)(b) of the Ethics Code and the Section 8 A of the Code of Conduct together, the Ethics Board's jurisdiction is limited to considering violations of the Code of Conduct.
- C. The Board has no authority to go beyond determining whether the official named in the complaint violated a requirement, prohibition of or guideline actually set forth in the Code of Conduct.
- D. The Ethics Board is not authorized to decide 1st amendment violations.
- E. The City Personnel policies do not apply to Alder's and are not referenced in the Code of Conduct.
- F. The Ethics Board lack authorization and therefore jurisdiction to consider and recommend sanctions for the violation of the first amendment or personnel policies under the Code of Conduct.
- G. The Ethics Board has jurisdiction over the Complaint in this matter to the extent that it states a violation of Section 4 of the Code of Ethics.
- H. The facts alleged regarding a first amendment violation and a violation of the City Personnel Policies remain relevant in determining whether there has been a violation of the Code of Conduct.

- I. The heading “In Public Meetings” while not part of the rule in Section 4 provides guidance with regard to the meaning of Section 4.
- J. The wording of the introductory portion of Section 4 is indicative of the intent that the public forum referred to in the body of that section refers to conduct in public meetings.
- K. The remainder of Section 4 under the heading of “In Public Meetings” likewise favors the conclusion that the Ethics Board and the Common Council intended to address common council and other public meetings with that language.
- L. The allegations as clarified by Mr. Knight’s exhibits address the deletion of people from Alder VanderLeest’s Facebook page.
- M. The law regarding social media public forum is not fully developed as it was first recognized in the public courts in 2019.
- N. As the Code of Conduct was adopted in 2015 it is not likely that the Common Council could have anticipated that certain uses of the social media would constitute a public forum as that term is used in Section 4.
- O. As Mr. Knight’s allegations do not address Mr. VanderLeest’s conduct in public meetings the Board concludes the conduct complained of did not.
- P. The language cited in the Complaint and found in relevant part in Section 4 of the Code of Conduct was not intended to prohibit the conduct complained of in the Complaint
- Q. The facts alleged in the Complaint, do not state a violation of Section 4 of the Code of Ethics.

Decision and Recommendation

Based on the Findings of Fact and Conclusions of Law stated above and upon all records and arguments in these proceedings, the Ethics Board of the City of Green Bay pursuant to Section 8 of the Code of Conduct, decides and recommends to the Common Council as follows:

- I. The Ethics Board lacks jurisdiction and authority to consider and decide whether Alder VanderLeest’s conduct violates the First Amendment or the City Personnel Policies.
- II. The most reasonable reading of Section 4 of the Code of Conduct, in context, is that it was intended to address conduct in public meetings and was not intended to address social media issues.

- III. The Code of Conduct does not expressly prohibit or otherwise give fair warning to an Alder that deleting the names of people or otherwise removing them from a Facebook page, constitutes a violation of the Code of Conduct.
- IV. If the Common Council wishes to direct the Ethics Board to consider conduct of Alders on social media, that topic should be directly addressed in the Code of Conduct. The Ethics Board will not extend its authority on its own without such direction.
- V. The Ethics Board therefore decides and recommends that the Complaint in this matter be dismissed and that no sanctions be imposed on Alder VanderLeest for the conduct complained of therein.

Dated in Green Bay this 17th day of November, 2020 by the City of Green Bay Ethics Board

William VandeCastle, Board Chair

Law Department

July 13, 2020

RE: Ethics Complaint
Tarl Knight v. John S. VanderLeest

Dear Alder VanderLeest:

Thank you for agreeing to accept service of the Ethics Complaint filed by Mr. Tarl Knight by certified mail. Enclosed please find a summons for the related Ethics Board meeting, as well as a copy of the complaint.

Respectfully,

Lindsay Mather
Assistant City Attorney

100 North Jefferson Street ♦ Green Bay, WI, 54301 ♦ 920 448 3080 ♦ Fax 920 448 3081 ♦

BEFORE THE ETHICS BOARD
OF THE CITY OF GREEN BAY

TARL KNIGHT,

Complainant,

v.

JOHN S. VANDERLEEST,

Respondent.

SUMMONS

THE CITY OF GREEN BAY TO JOHN S. VANDERLEEST:

Please take notice that pursuant to Sections 1.90(8), Green Bay Municipal Code, and Section 8, Code of Conduct for Elected Officials, you are hereby commanded to appear via Zoom meeting before the Ethics Board of the City of Green Bay on July 22, 2020 at 5:00 P.M., to respond to the attached complaint and show cause as to why you should not be subject to penalties and sanctions. The information about the Zoom meeting is attached to this Summons as Exhibit A.

Further take notice that at the time of said hearing, you may produce witnesses, cross-examine witnesses, and be represented by counsel. You may also have the record transcribed at your own option and expense.

At the conclusion of this hearing, the Ethics Board will submit a report to the Common Council of findings of fact, conclusions of law, and a recommendation as to what action, if any, the Common Council should take with respect to the charges in the complaint.

Dated at Green Bay, Wisconsin, this 9 day of July, 2020.

Kimberly Wayte
Deputy City Clerk

Lindsay Mather

Exhibit A

The Office of Tarl Knight
405-409 West Walnut Street
Green Bay, WI 54303

Dear City Clerk Kris Teske,

I'm Tarl Knight. I live at 1341 Taylor Street #B, Green Bay, WI 54303. As you know, I'm a local Green Bay business and property owner and I also participated as a candidate for Green Bay's City Council. I am available both at (920) 562-5612 and tarlknight@tarlknight.com.

I'm writing with a formal complaint against Alderman John S. Vanderleest of the City of Green Bay's 11th District.

As a candidate for local office, I have had the opportunity to visit with several hundreds and thousands of constituents across the west side. Constituents always have various concerns, but none greater than their own alderperson not contacting them back, screening their calls and texts, and blocking them through their official media accounts, such as Facebook.

As public forums, citizens are provided the freedom of speech and the freedom of assembly to speak out and correspond with their alderperson. But over the last year, several constituents have come out with complaints about having been blocked or their posts and comments having been deleted. They have complained about being turned away by message or by phone if they admit to supporting another candidate for alderperson. And I, along with several others, have very serious concerns about the limiting of citizens' First Amendment freedoms, particularly by a local official.

Constituents have complained about being blocked or their posts and comments being deleted since 2016, several of whom continue to be blocked as of 2020. I trust an alderperson to advocate for their constituents, not turn them away and block them if they have concerns. But Alderman John S. Vanderleest continues to prove similar behaviour to be habitual.

The Supreme Court has confirmed social media as a "modern public forum", and as of last year, U.S. Circuit Court of Appeals affirmed public officials' Facebooks, Instagrams, and other media accounts to indeed constitute public forums, citing *Davison vs. Randall*:

"Public officials may not retaliate against speech they dislike by suppressing expression on social media."

Federal courts also stated:

"The suppression of critical commentary regarding elected officials is the quintessential form of viewpoint discrimination against which the First Amendment guards."

Alderman Vanderleest's public Facebook account titled "Green Bay City Council - John S. Vanderleest" is, for all intents and purposes, a public forum. Alderman Vanderleest has consistently and intentionally challenged constituents' freedoms of speech and assembly, not only unconstitutional behaviour but also un-American.

As a member of the City Council of the City of Green Bay, Alderman Vanderleest is mandated to abide by the City's Code of Conduct:

"No signs of partiality, prejudice, or disrespect should be evident on the part of individual Council members toward an individual participating in a public forum. Every effort should be made to be fair and impartial... The Council members are expected to demonstrate, both publicly and privately, their honesty and integrity, and to be an example of appropriate and ethical conduct. All Council members should convey to the public their respect and appreciation for the public's participation, input, and opinions."

Blocking opposing points of view at public forums automatically and categorically violates the City of Green Bay's Code of Conduct. But besides the Code of Conduct, the City's social media policy states:

"City social media sites shall adhere to applicable federal, state, and local laws. This includes any applicable open records requirements. Any content maintained in a social media format that is related to City business is public record. Content must be able to be managed, stored, and retrieved to comply with applicable laws."

Without their original posts and comments, constituents cannot provide the proper proof or information as to their specific content. But several are available to provide proof of having been blocked. I have attached a list of constituents available to testify with means to contact them. Please contact them if necessary.

Please also consider the formal complaint a warning of potential further litigation by the affected parties against Alderman John S. Vanderleest and the City of Green Bay.

As per Section 8 of the City of Green Bay's Code of Conduct:

"Information contained in the complaint is true and correct, or the complainant has good reason to believe and does believe that the facts alleged are true and correct and that they constitute a violation of the Code."

Thank you for the attention to the matter.

Sincerely,

Tarl Knight

of the City of Green Bay

Tarl Knight, Complainant

vs.

John S. Vanderleest
Respondent

MOTION FOR COMPLAINTS FROM THE ALLEGED AGGRIEVED PARTIES

The respondent, by his attorney, Robert J. Miller, states as follows

1. Upon information and belief, no posts of Mr. Knight have been blocked or deleted by the respondent.
2. Mr. Knight may not have standing to complain and may not have any personal (first-hand) knowledge of the facts.
3. The respondent is entitled to a complete outline of the complainants allegations before proceeding.
4. Mr. Knight suggests that "several are available to provide proof of having been blocked" He attached a list of parties.
5. Respondent's counsel is unclear whether he has the right to subpoena their testimony at a deposition or even at a hearing.
6. Respondent's counsel is unable to cross-examine pieces of paper or even compel testimony from the actual aggrieved parties.

Dated this 20th day of July 2020

Before the Ethics Board of the City of Green Bay

TARL KNIGHT,

Complainant,

vs.

JOHN S. VANDERLEEST,

Respondent.

ARGUMENT

The Ethics Complaint lodged by the Complainant, a former candidate for City Council, against the Respondent accuses the Respondent of having blocked social media posts made by other individuals on a social media account used by the Respondent for governmental purposes. Such material as has been blocked was on the ground that the posts contained offensive and insulting material. None of the material at issue directly concerned the Complainant.

The Respondent submits that his actions constitute neither misconduct nor unethical behavior, as similar actions by public officials have been upheld by multiple courts. The Respondent exercised his discretion as a public official in good faith and in a manner that was objectively reasonable. The Ethics Complaint filed against him has no merit.

Section 1 of the City of Green Bay Code of Conduct states, in part, that

August 3, 2020
Robert J. Miller, Atty.
Page 2

[M]embers of the Common Council and Mayor shall maintain the utmost standards of personal integrity, trustfulness, honesty, and fairness in carrying out their public duties, avoid any improprieties in their roles as public servants, comply with all applicable laws, and never use their City position or authority improperly or for personal gain.

City of Green Bay, Wisconsin Conduct of Conduct § 1.

The conduct at issue here, blocking or deleting offensive and insulting posts on a social media account used for a governmental purpose, does not violate any of the above-mentioned general standards. The only specific category in the Code of Conduct that conceivably could apply here is Section 4, on elected officials' conduct toward the public. Nothing in that section, which primarily deals with public meetings, applies to the use of social media.

Nor is the conduct in question in violation of the requirement in the City's social media policy that use of social media adhere to applicable federal, state, and local laws.

The federal Communications Decency Act provides, in pertinent part, as follows:

No provider or user of an interactive computer service shall be held liable on account of—

(A) any action voluntarily taken in good faith to restrict access to or availability of material that the provider or user considers to be obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable, whether or not such material is constitutionally protected[.]

47 U.S.C. § 230(c)(2).

There is an abundance of case law in which courts have upheld similar actions by public officials and/or have declined to impose liability on the officials.

August 3, 2020
Robert J. Miller, Atty.
Page 3

In *Morgan v. Bevin*, 298 F. Supp. 3d 1003 (E.D. Ky. 2018), a civil rights action for the alleged violation of the First Amendment, citizens whose accounts were blocked by the Governor of Kentucky on social media websites failed to show that the public interest would be served by issuing an injunction. Thus, a preliminary injunction preventing the Governor from blocking anyone in the future and restoring the citizens' accounts and accounts of other similarly situated individuals was not warranted. In addition, the Governor's use of privately owned social media websites was personal speech because he was speaking on his own behalf. The First Amendment did not apply, and the Governor's accounts were privately owned channels of communication that were not converted to public property by their use by a public official. *Id.* at 1010-11.

In *McKercher v. Morrison*, No. 18CV1054 JM(BLM), 2019 WL 1098935 (S.D. Cal. Mar. 8, 2019), the court dismissed an action alleging that a mayor blocked the plaintiff from accessing the mayor's personal Facebook website in retaliation for, among other things, criticizing him as an elected official. The mayor had qualified immunity from such a lawsuit. Significantly, such immunity applies to officials who have a reasonable, *even if mistaken*, belief about the facts or about what the law requires in any given situation. *Id.* at *3.

In *Price v. City of New York*, No. 15 CIV. 5871 (KPF), 2018 WL 3117507 (S.D.N.Y. June 25, 2018), the court granted qualified immunity to city officials in an action brought by a citizen whose posts on social media had been blocked. *Accord*

August 3, 2020
Robert J. Miller, Atty.
Page 4

Tanner v. Ziegenhorn, No. 4:17-CV-780-DPM, 2019 WL 2344094, at *1 (E.D. Ark. May 31, 2019) ("The Court assumes, for purposes of Kennedy and Chapman's motion to dismiss, that these deletions [from the State Police Facebook account] infringed Tanner's free speech rights. The guiding law, though, wasn't clear enough then to subject Kennedy and Chapman to suit. State actors are entitled to qualified immunity unless they violate clearly established law."); *Davison v. Rose*, No. 1:16CV0540 (AJT/IDD), 2017 WL 3251293, at *10 (E.D. Va. July 28, 2017) ("Here, the law is less than settled as to whether the Plaintiff had a right to post on a Facebook page maintained by a public official and that this right was violated when those postings were removed or when Plaintiff was prevented from posting his comments. . . . It is not clear as a legal matter whether the Facebook pages at issue in this litigation can be said to constitute either type of public forum. In any event, it cannot be said that such a First Amendment right was a 'clearly established' right, 'of which a reasonable person would have known.' These Individual Defendants are therefore entitled to qualified immunity for the actions they took against Plaintiff with respect to their Facebook pages."); *Davison v. Plowman*, 247 F. Supp. 3d 767, headnote 12 (E.D. Va. 2017) ("It would not have been apparent to a reasonable government official that excluding county resident from limited public forum, a county commonwealth's attorney's social media page, after resident repeatedly disregarded the forum's rules, would violate the First Amendment, and thus county commonwealth's attorney was entitled to qualified immunity from resident's § 1983 action with respect to

attorney's decision to block resident from further posting on the county commonwealth's attorney's social media page[.]"), *aff'd*, 715 F. App'x 298 (4th Cir. 2018) (unpublished opinion); *Hunt v. Bd. of Regents Univ. of N.M.*, 338 F. Supp. 3d 1251 (D.N.M. 2018) (even assuming that university official violated medical student's First Amendment right to post on social networking website by subjecting him to corrective action after his inflammatory post was found to constitute unprofessional conduct in violation of university's social media policy, student's right was not "clearly established" when the discipline was imposed, and so chair was entitled to qualified immunity), *aff'd*, 792 F. App'x 595 (10th Cir. 2019) (unpublished opinion); *Wagschal v. Skoufis*, No. 19 CIV. 2393 (CM), 2020 WL 1033873 (S.D.N.Y. Mar. 3, 2020) (state legislator was entitled to qualified immunity from liability in private citizen's § 1983 action alleging that legislator violated his First Amendment rights by blocking him from social media pages); *Novak v. City of Parma*, 932 F.3d 421 (6th Cir. 2019) (police officers were entitled to qualified immunity from liability in action alleging that officers violated social media page creator's First Amendment rights by seeking to have social media platform remove comments).

The Respondent does not dispute that there are some reported cases in which public officials have been found to have violated the First Amendment rights of persons or groups by blocking access to social media, but he submits that such cases differ significantly from this case. For example, in *One Wisconsin Now v. Kremer*, 354 F. Supp.

August 3, 2020
Robert J. Miller, Atty.
Page 6

3d 940 (W.D. Wis. 2019), state legislators violated the First Amendment by blocking a liberal advocacy group from the legislators' respective accounts on an online social media platform where, as is not the case here, the legislators blocked only a select number of accounts and articulated no specific reason for blocking the group. Unlike anything in the instant case, the defendants in *Kremer* blocked the plaintiff because of its prior speech or identity and even indicated, either directly or indirectly, that they did not approve of the plaintiff's political perspective. *Id.* at 956.

There is a well-established presumption in the law that public officers, in performing their official duties, have complied with all statutory requirements, and such presumption applies to acts of official boards and legislative bodies as well as to the acts of individual officers. *Bohn v. Sauk Cty.*, 268 Wis. 213, 67 N.W.2d 288 (1954); *State ex rel. Richey v. Neenah Police & Fire Comm'n*, 48 Wis. 2d 575, 180 N.W.2d 743 (1970).

Members of a city's governing council, in particular, are presumed to have acted regularly and lawfully. *Town of Medary v. City of La Crosse*, 88 Wis. 2d 101, 277 N.W.2d 310 (Ct. App. 1979). The actions of the Respondent, as alleged in the Ethics Complaint, were entirely reasonable and lawful. At the very least, such actions are far short of what is required to overcome the presumption of good faith and legality.

Attorney for Respondent John S. Vanderleest

Before the Ethics Board
of the City of Green Bay

Tarl Knight, Complainant

vs.

John S. Vanderleest
Respondent

ARGUMENT

I. The grant of right to counsel in section 8 (d) (3) connotes the rights for effective counsel.

The grant of a right to counsel is illusory unless counsel has a right to adequately prepare the defense. We have not allowed "trial by ambush" in the American courts for over 100 years.

The respondent is requesting a suspension of the proceedings so that he can depose the complainants. This is especially necessary as the complaint as presently constituted has nothing from the actual parties.

In **Goldberg vs. Kelly**, 397 U.S. 254 1970 at paragraph 17, the U.S. Supreme Court addressed this issue:

Certain principles have remained relatively immutable in our jurisprudence. One of these is that where governmental action seriously injures an individual, and the reasonableness of the action depends on fact findings, the evidence used to prove the Government's case must be disclosed to the individual so that he has an opportunity to show that it is untrue. While this is important in the case of documentary evidence, it is even more important where the evidence consists of the testimony of individuals whose memory might be faulty or who, in fact, might be perjurers or persons motivated by malice, vindictiveness, intolerance, prejudice, or jealousy. We have formalized these protections in the requirements of confrontation and cross-examination. They have ancient roots. They find expression in the Sixth Amendment * * *.

This Court has been zealous to protect these rights from erosion. It has spoken out not only in criminal cases, * * * but also in all types of cases where administrative * * * actions were under scrutiny.'

II. The right to call witnesses and cross-examine witnesses is meaningless without the right to compel the witnesses to appear.

A. Part of the effectiveness of the right to counsel is the presentation of testimony. This right is an empty one if an individual with valuable testimony cannot be compelled to appear. Again, this issue was discussed in the **Goldberg** case, at paragraph 19.

The right to be heard would be, in many cases, of little avail if it did not comprehend the right to be heard by counsel.' Powell v. Alabama, 287 U.S. 45, 68—69, 53 S.Ct. 55, 64, 77 L.Ed. 158 (1932). We do not say that counsel must be provided at the pre-termination hearing, but only that the recipient must be allowed to retain an attorney if he so desires. Counsel can help delineate the issues, present the factual contentions in an orderly manner, conduct cross-examination, and generally safeguard the interests of the recipient.

B. The Wisconsin Municipal Administrative Procedure Act (Chapter 68 of the Wisconsin Statutes) may have applicability here. At the very least, section 68.11 of the Wisconsin Statutes accords counsel the right to subpoena witnesses/records in a proceeding under the section.

III. The Communications Decency Action (appended) permits the deletion of objectionable content and the federal government has pre-empted the area.

A. 47 U.S.Code 230 (c) (2) permits the removal of objectionable content. Among the elevated political discourse which is sought to be preserved by the petitioner is the following:

1. I reliably informed that one post called the respondent a "schmuck."
This is Yiddish for penis.
2. Another post according to my information, denigrated my client's business and his integrity.
3. Yet another post called my client a criminal.

B. 47 U.S. Code 230 (e)(3) highlighted in purple) indicates that any state or local action contrary to this is prohibited. The federal government has pre-empted the area.

IV. Considerations for Ethics Board-- The action of policing content is a legal thicket surrounded by constitutional quicksand.

Second-guessing the deletion of posts, etc on the web could mushroom into a full-time occupation for this board.

Ultimately, limiting council members abilities to superintend their sites will have them appear to ratify, endorse, and sponsor the reprehensible content. It will have the government compelling speech, which is, in itself a constitutional violation. Moreover, the adoption and support of this repulsive content is an ethics violation.

Thus council members, such as my client, are damned to ethics code violations if they delete the content and damned to ethics violations if they do not.

47 U.S. Code § 230 - Protection for private blocking and screening of offensive material

U.S. Code Notes

(b) Purposes of the Congress that the following:

- (1) The rapid development of Internet and other interactive computer services enables individuals to publish information on the Internet and other interactive computer services without regard to the traditional barriers of publication and distribution.
- (2) These services offer users a great degree of control over the information that they receive, as well as the potential for greater control in the future as technology advances.
- (3) The Internet and other interactive computer services offer a forum for a wide diversity of political, social, and other expression for cultural enrichment, and myriad avenues for individual activity.
- (4) The Internet and other interactive computer services have been shown to be beneficial to all Americans with a minimum of government regulation.
- (5) Individuals are using the Internet and other interactive services for a variety of political, educational, and other purposes.

(c) Policy of the United States—

- (1) to promote the continued development of the Internet and other interactive computing services, and other electronic media;
- (2) to preserve the vibrant and competitive free market that presently exists for the Internet and other interactive computer services, unfettered by Federal or State regulation;
- (3) to encourage the development of technologies which maximize user control over what information is received by individuals, families, and schools who use the Internet and other interactive computing services;
- (4) to remove disinclines for the development and utilization of blocking and filtering technologies that empower parents to restrict their children's access to objectionable or inappropriate online materials; and
- (5) to ensure vigorous enforcement of Federal criminal laws in their own public protection in libel, theft, and harassment by means of computer.

(d) Protection for "Online Services" against civil damages or criminal penalties

- (1) No provider or user of an interactive computer service shall be treated as the publisher or speaker of any information posted by a third party on the service.
- (2) Civil damages or other financial penalties shall be held liable in an action of—
 - (A) any claim for damages or other financial penalties to which the provider or user is not liable under the law of the jurisdiction in which the claim is brought; or
 - (B) any claim for damages or other financial penalties to which the provider or user is not liable under the law of the jurisdiction in which the claim is brought.

(e) Exceptions to publisher protection

- (1) The protection of this section shall not apply to a provider or user of an interactive computer service who—
 - (A) is a provider or user of a service that is operated by a person who is not a provider or user of an interactive computer service; or
 - (B) is a provider or user of a service that is operated by a person who is not a provider or user of an interactive computer service.

(f) Effect on other laws

- (1) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (2) The protection of this section shall not be construed to preempt any law providing for intellectual property.

- (3) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (4) The protection of this section shall not be construed to preempt any law providing for intellectual property.

- (5) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (6) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (7) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (8) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (9) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (10) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (11) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (12) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (13) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (14) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (15) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (16) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (17) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (18) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (19) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

- (20) No other law shall be construed to preempt the enforcement of section 223 or 225 of this title, chapter 21 (relating to obscenity) or 22 (relating to sexual exploitation of children) of title 18, or any other law.

7 U.S. Code § 230 - Protection for private blocking and screening of offensive material

U.S. Code

(a) Findings—The Congress finds the following:

(1) The rapidly developing array of Internet and other interactive computer services available to individual Americans represent an extraordinary advance in the availability of educational and informational resources to our citizens.

(2) These services offer users a great degree of control over the information that they receive, as well as the potential for even greater control in the future as technology develops.

(3) The Internet and other interactive computer services offer a forum for a true diversity of political discourse, unique opportunities for cultural development, and myriad avenues for intellectual activity.

(4) The Internet and other interactive computer services have flourished, to the benefit of all Americans, with a minimum of government regulation.

(5) Increasingly Americans are relying on interactive media for a variety of political, educational, cultural, and entertainment services.

(b) Policy—It is the policy of the United States—

(1) to promote the continued development of the Internet and other interactive computer services and other interactive media;

(2) to preserve the vibrant and competitive free market that presently exists for the Internet and other interactive computer services, unfettered by Federal or State regulation;

(3) to encourage the development of technologies which maximize user control over what information is received by individuals, families, and schools who use the Internet and other interactive computer services;

(4) to remove disincentives for the development and utilization of blocking and filtering technologies that empower parents to restrict their children's access to objectionable or inappropriate online material; and

(5) to ensure vigorous enforcement of Federal criminal laws to deter and punish trafficking in obscenity, stalking, and harassment by means of computer.

(c) Protection for "Good Samaritan" blocking and screening of offensive material

(1) Treatment of publisher or speaker

No provider or user of an interactive computer service shall be treated as the publisher or speaker of any information provided by another information content provider.

(2) Civil liability No provider or user of an interactive computer service shall be held liable on account of---

(A) any action voluntarily taken in good faith to restrict access to or availability of material that the provider or user considers to be obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable, whether or not such material is constitutionally protected; or

(B) any action taken to enable or make available to information content providers or others the technical means to restrict access to material described in paragraph (1). [1]

(d) Obligations of interactive computer service

A provider of interactive computer service shall, at the time of entering an agreement with a customer for the provision of interactive computer service and in a manner deemed appropriate by the provider, notify such customer that parental control protections (such as computer hardware, software, or filtering services) are commercially available that may assist the customer in limiting access to material that is harmful to minors. Such notice shall identify, or provide the customer with access to information identifying, current providers of such protections.

(e) Effect on other laws

(1) No effect on criminal law

Nothing in this section shall be construed to impair the enforcement of section 223 or 231 of this title, chapter 71 (relating to obscenity) or 110 (relating to sexual exploitation of children) of title 18, or any other Federal criminal statute.

(2) No effect on intellectual property law

Nothing in this section shall be construed to limit or expand any law pertaining to intellectual property.

(3) State law

Nothing in this section shall be construed to prevent any State from enforcing any State law that is consistent with this section. No cause of action may be brought and no liability may be imposed under any State or local law that is inconsistent with this section.

(4) No effect on communications privacy law

Nothing in this section shall be construed to limit the application of the Electronic Communications Privacy Act of 1986 or any of the amendments made by such Act, or any similar State law.

(5)No effect on sex trafficking lawNothing in this section (other than subsection (c)(2)(A)) shall be construed to impair or limit—

(A)any claim in a civil action brought under section 1595 of title 18, if the conduct underlying the claim constitutes a violation of section 1591 of that title;

(B)any charge in a criminal prosecution brought under State law if the conduct underlying the charge would constitute a violation of section 1591 of title 18; or

(C)any charge in a criminal prosecution brought under State law if the conduct underlying the charge would constitute a violation of section 2421A of title 18, and promotion or facilitation of prostitution is illegal in the jurisdiction where the defendant's promotion or facilitation of prostitution was targeted.

(f)DefinitionsAs used in this section:

(1)Internet

The term "Internet" means the international computer network of both Federal and non-Federal interoperable packet switched data networks.

(2)Interactive computer service

The term "interactive computer service" means any information service, system, or access software provider that provides or enables computer access by multiple users to a computer server, including specifically a service or system that provides access to the Internet and such systems operated or services offered by libraries or educational institutions.

(3)Information content provider

The term "information content provider" means any person or entity that is responsible, in whole or in part, for the creation or development of information provided through the Internet or any other interactive computer service.

(4)Access software providerThe term "access software provider" means a provider of software (including client or server software), or enabling tools that do any one or more of the following:

(A)filter, screen, allow, or disallow content;

(B)pick, choose, analyze, or digest content; or

(C)transmit, receive, display, forward, cache, search, subset, organize, reorganize, or translate content.

(June 19, 1934, ch. 652, title II, § 230, as added Pub. L. 104–104, title V, § 509, Feb. 8, 1996, 110 Stat. 137; amended Pub. L. 105–277, div. C, title XIV, § 1404(a), Oct. 21, 1998, 112 Stat. 2681–739; Pub. L. 115–164, § 4(a), Apr. 11, 2018, 132 Stat. 1254.)

U.S. Code Toolbox

WISCONSIN ETHICS COMMISSION ADVICE:

First Document: Explaining purpose and advice to local governments (from their web site)

Second Document: Table indicating that legislator and staff can "manage" facebook posts

Third Document: Complete document containing advice on social media use

Fourth Document: Additional advice on social media use

We find almost no restrictions on public officials use of social media except insofar as it restricts the use of public money for some activities.

e of Wisconsin
Ethics Commission

Requests for Advice

Requesting advice from the Wisconsin Ethics Commission

Any individual, either personally or on behalf of an organization or governmental body, may request of the Ethics Commission an advisory opinion regarding the propriety under the ethics, lobbying, or campaign finance laws of any matter to which the person is or may become a party. Any appointing officer, with the consent of a prospective appointee, may request of the Ethics Commission an advisory opinion regarding the propriety of any matter to which the prospective appointee is or may become a party.

Confidentiality

Written requests for advice and the Commission's replies are confidential unless made public by the requestor. No member or employee of the Ethics Commission may make public the identity of anyone requesting an advisory opinion or of persons mentioned in an opinion. Periodically, the Commission publishes summaries of its opinions after making sufficient alterations to prevent the identification of the requestor and persons mentioned in the opinions.

How to request an advisory opinion

A request for an advisory opinion of the Commission may be made in writing or electronically. The request should state each question upon which an opinion is desired, present all relevant facts, be as specific as possible, identify the names of all parties that are pertinent to the question, and include references to pertinent law known to the requestor. Requests should be submitted to the Commission Administrator or addressed generally to the Commission. Please see the [Contact Us](https://ethics.wi.gov/Pages/AboutUs/ContactUs.aspx) ([/Pages/AboutUs/ContactUs.aspx](https://ethics.wi.gov/Pages/AboutUs/ContactUs.aspx)) page for current contact information.

A request posed by an attorney-at-law on a client's behalf should also set forth: a tentative conclusion upon each question presented, the reasoning upon which that conclusion is based, and all relevant statutory provisions, case law, opinions of the Attorney General, prior opinions of the Ethics Commission, and other authorities, whether or not they support the tentative conclusion concerning the questions presented.

A request requiring the resolution of questions of fact should not be submitted because the Ethics Commission cannot resolve factual issues in an opinion. A local public official may request an advisory opinion relating to the code of ethics for local government officials, Wis. Stat. § 19.59, from the attorney for the official's local unit of government. A local government attorney may seek advice from the Ethics Commission.

Requesting opinions - County, municipal and other local government attorneys

Pursuant to Wis. Stat. § 19.59(6), a county corporation counsel, an attorney for a local governmental unit, or a state-wide association of local governmental units may ask the Wisconsin Ethics Commission to issue an opinion concerning the interpretation of Wis. Stat. § 19.59, the Code of Ethics for local government officials, employees and candidates. Written requests for advice are confidential. No member or employee of the Ethics Commission may make public the identity of anyone requesting an advisory opinion or of persons mentioned in an opinion. Periodically, the Commission publishes summaries of its opinions after making sufficient alterations to prevent the identification of the requestor and persons mentioned in the opinions. The Statutes do not authorize the Commission to issue an opinion to an official or representative of a local government other than the local government's legal counsel.

A request from a county corporation counsel, an attorney for a local governmental unit, or a state-wide association of local governmental units should:

- State on whose behalf the opinion is requested.
- State each question upon which an opinion is desired.
- State all of the facts giving rise to each question presented.
- Set forth a tentative conclusion upon each question presented and the reasoning upon which that conclusion is based.
- Set forth and analyze all relevant statutory provisions, case law, prior opinions of the Ethics Commission, and the authorities whether or not they support the tentative conclusion concerning the questions presented.

A request requiring the resolution of questions of fact should not be submitted because the Ethics Commission has no authority to decide questions of fact. The Ethics Commission does not issue opinions on whether past conduct has violated the law. Although the foregoing criteria are subject to exception when the circumstances warrant, a request which does not meet these criteria may be returned and the requestor asked to resubmit the request in an appropriate form.

Advisory Opinion Request Process

Upon receipt of a valid opinion request, staff will confirm receipt with the person making the advisory opinion request. Staff will then prepare an analysis of the request and document relevant statutes, case law and constitutional law. For formal opinion requests, staff will also confirm with the requestor whether or not they wish to request a public hearing on the matter. Upon completion of the analysis of the request, staff will contact the Commission to schedule the opinion request for the next available Commission meeting. At the Commission's discretion, a special Commission meeting may be scheduled to

address the request if the requestor can demonstrate the need for such urgency. Requestors may also wish to consider an informal advisory opinion for urgent matters. Please see the section below for additional information about informal advisory opinion requests.

Informal Advisory Opinions

At its March 7, 2017 meeting the Ethics Commission delegated the authority to issue informal advisory opinions. A copy of the adopted policy and the delegation of authority is available here: [Ethics Commission Policy - Delegation of Authority for Informal Advisory Opinions.pdf](#) ([/Resources/EthicsCommissionPolicy-DelegationOfAuthorityForInformalAdvisoryOpinions.pdf](#)). As required by Wisconsin Statutes, the Commission shall review each informal advisory opinion at its next scheduled meeting.

Evidence of intent to comply with law

It is prima facie evidence of intent to comply with the Ethics Code for State Public Officials (subch. III, ch. 19, Wisconsin Statutes) and the lobbying law (subch. III, ch. 13, Wisconsin Statutes) when a person refers a matter to the Ethics Commission and abides by the Commission's advisory opinion, if the material facts are as stated in the opinion request. Wis. Stat. § 19.46(2).

2020 ETH 01

CAMPAIGN FINANCE & ETHICS – 50-PIECE RULE AND MIXED-USE SOCIAL MEDIA ACCOUNTS

You are a legislative staff person. You have asked for an advisory opinion regarding the use of official legislative social media accounts and legislative office budgets for various types of communications when under the restrictions of WIS. STAT. § 11.1205 ("the 50-piece rule").

Summary:

It is the opinion of the Commission that legislators and legislative staff may use official legislative social media accounts and legislative office budgets as described below.

Analysis:

A. Wisconsin's 50-Piece Rule

The questions in this section primarily require the application of WIS. STAT. § 11.1205:

11.1205 Use of government materials by candidates.

(1)

(a) Except as provided in sub. (2), no person elected to state or local office who becomes a candidate for national, state, or local office may use public funds for the cost of materials or distribution for 50 or more pieces of substantially identical material distributed after:

1. In the case of a candidate who is nominated by nomination papers, the first day authorized by law for circulation of nomination papers as a candidate.
2. In the case of a candidate who is nominated at a primary election by write-in votes, the day the board of canvassers issues its determination that the person is nominated.
3. In the case of a candidate who is nominated at a caucus, the date of the caucus.
4. In the case of any other candidate who is nominated solely by filing a declaration of candidacy, the first day of the month preceding the month which includes the last day for filing the declaration.

(b) This subsection applies until after the date of the election or after the date of the primary election if the person appears as a candidate on a primary election ballot and is not nominated at the primary election.

(2) This section does not apply to use of public funds for the costs of the following:

- (a) Answers to communications of constituents.
- (b) Actions taken by a state or local government administrative officer pursuant to a specific law, ordinance or resolution which authorizes or directs the actions to be taken.
- (c) Communications between members of the legislature regarding the legislative or deliberative process while the legislature is in session.
- (d) Communications not exceeding 500 pieces by members of the legislature relating solely to the subject matter of a special session or extraordinary session, made during the period between the date that the session is called or scheduled and 14 days after adjournment of the session.

1. Does one Facebook/Twitter post count as sending out one item regardless of how many individuals view or share it?

Wisconsin law prohibits individuals elected to state or local office who become candidates for national, state, or local office from using public funds for the cost of materials or distribution of 50 or more pieces of substantially identical material distributed during a campaign period ("the 50-piece rule"), except as specifically permitted. WIS. STAT. § 11.1205.

Over the course of 2018 and 2019, the Commission has taken several steps to clarify the appropriate uses of social media by public officials and explain the application of the 50-piece rule to social media communications. See 2018 ETH 03, Guidelines ETH-1251 and ETH-1253. In 2018 ETH 03, the Commission formally analyzed WIS. STAT. § 11.1205 and considered how to count instances of electronic communication under the 50-piece rule. In that opinion, the Commission held that electronic communications where the sender actively selects recipients would be counted as a single "piece" per recipient (e.g., emails, text messages, or direct messages); however, electronic communications that were published in a singular form, but could be read by multiple individuals (e.g., a website page, Facebook post, or tweet) would only be counted as a single piece. 2018 ETH 03. This remains true regardless of the number of times the page, post, or tweet is viewed.

However, 2018 ETH 03 is silent as to the question of how a recipient's share of a communication with others should be counted under the 50-piece rule. The statute is similarly silent. See WIS. STAT. § 11.1205. For example, if a legislator who is up for election uses a state computer system during the campaign period to send a single individual an email and that person independently decides to forward that email to 50-plus others, would that be a violation of the 50-piece rule? What if the sender asks the original recipient to forward it and the recipient sends it to 50 plus others, would that be a violation of the 50-piece rule? The answer to these questions require an interpretation the language of WIS. STAT. § 11.1205.

The purpose of statutory interpretation is to determine what the statute means so that it may be given its full, proper, and intended effect. *State ex rel. Kalal v. Circuit Court for Dane Cty.*, 2004 WI 58, ¶44. Statutory interpretation begins with the language of the statute. *Id.* at ¶45. Statutory language is given its common, ordinary, and accepted meaning. *Id.* Statutory language should also be interpreted in the context in which it is used; not in isolation, but as part of a whole; in relation to the language of surrounding or closely-related statutes; and reasonably, to avoid absurd or unreasonable results. *Id.* at ¶46. If the meaning of the statute is plain, the inquiry ordinarily ends there. *Id.* at ¶45. However, a literal reading of a statute may be rejected if it would lead to an absurd or unreasonable result that does not reflect the legislature's intent. *State v. Jennings*, 2003 WI 10, ¶11. Additionally, statutory interpretations that render provisions meaningless should be avoided. *Belding v. Demoulin*, 2014 WI 8, ¶17.

While the 50-piece rule is codified in Chapter 11, the campaign finance laws, the 50-piece rule is more akin to the prohibitions of subchapter III of Chapter 13 or Chapter 19 in that it regulates conduct by current officeholders and seeks to prohibit abuses of office. In these contexts, there are long-standing interpretations that an official cannot do indirectly what he or she is prohibited from

doing directly, even where the statute is silent as to indirect applications. See e.g., 2003 Eth Bd 11, ¶13; 2001 Wis Eth Bd 02, ¶17. As these other prohibitions are similar in nature to the prohibition of the 50-piece rule, the Commission believes a similarly inclusive interpretation would be appropriate when interpreting the prohibition here. However, reading Wis. STAT. § 11.1205 to include every email forward, Facebook share or Twitter retweet of an original communication would likely produce an absurd result where the sender has no knowledge or control over the republication including how many times the message is shared subsequent to the initial communication.

To avoid counting every instance of an initial recipient subsequently sharing a communication while still prohibiting circumvention of the restrictions of the 50-piece rule by employing another, the Commission again will look to the original sender's intentions and adopt an objective test where only the republications intended by the original sender will be counted. Accordingly, where the sender requests or intends for an initial recipient(s) to share the original communication with others, the Commission would then count the republications by the initial recipient(s) done at the request of the original sender as if they were done by the original sender.

2. Can elected officials use office funds to take out a legislative ad in a local newspaper while under the "50-piece rule"?

For each of the remaining 50-piece rule questions, it is important to note that the Ethics Commission can only speak to the laws it administers (Chapter 11, subchapter III of Chapter 13, and subchapter III of Chapter 19). The Commission generally has no authority over the use of legislative office funds. It is the understanding of the Commission that questions regarding the distribution of materials by legislators at government expense should be directed to either the Senate or Assembly Chief Clerk as appropriate. However, as you have asked specifically if these uses of funds would be permitted under the 50-piece rule, the Commission will answer your questions with caveat that when contemplating a use of legislative office funds, you should first seek an answer from the Chief Clerk's Office as to whether a specific expenditure is an appropriate use of state resources and consistent with the policies of the Legislature.

As explained in response to the first question, the 50-piece rule prohibits the use of public funds for the cost of materials or distribution for 50 or more pieces of substantially identical material during a campaign period. Wis. STAT. § 11.1205. This is true regardless of whether the sender is communicating a legislative or campaign message. See Wis. STAT. § 11.1205, 2018 ETH 03. Additionally, the selection of recipients is only a factor in counting the number of pieces for electronic communications. 2018 ETH 03. In this situation, while the elected official may only be sending one piece (i.e., the proposed ad) to the newspaper, it is clear that by paying the newspaper to publish the advertisement, the elected official would be using public funds to pay for the newspaper's subsequent production and distribution of the ad in each newspaper that is to be printed. Assuming the newspaper prints 50 or more copies, this practice would likely run afoul of the 50-piece rule when done during the campaign period. This conclusion is consistent with an informal opinion of the Elections Board in 1996, which held that "because public money would be used to purchase the distribution of more than 49 pieces of identical material (the ad in the newspaper), and because publication is deemed to fall within the statutory language, 'the cost of materials or distribution,' the post-June 1 publication would be proscribed by s. 11.33, Stats."

3. Can elected officials use office funds to place a legislative radio ad while under the "50-piece rule?"
- a) Are members restricted to 49 spots per ad?

The 50-piece rule only applies to the cost of materials or distribution for 50 or more pieces of substantially identical material. WIS. STAT. § 11.1205. A radio ad is a single audio recording broadcast on a specific radio frequency that can be received by any listener with a radio tuned to that frequency within range of the transmitter.¹ This singularity of material makes radio broadcasts more akin to a bulletin board or billboard, which are similarly platforms for a single message to be received by a large number of individuals. As such, the Commission believes that the 50-piece rule would not prohibit elected officials from using office funds to place legislative radio ads during a campaign period. However, to address the follow-up question, if subject to the 50-piece rule, an elected official is still limited to no more than 49 pieces of substantially identical material, so any single radio ad could not be played more than 49 times during the campaign period without running afoul of the statute.

4. Can an elected official use office funds to mail a legislative newsletter to a Postal patron route or "Every Door Direct Mail" list while under the "50-piece rule"? (see USPS postal patron map attached)

Similar to the response to Question #2, it is important to note that the 50-piece rule prohibits a candidate from using public funds for the cost of materials or distribution for 50 or more pieces of substantially identical material during a campaign period. WIS. STAT. § 11.1205. A USPS Postal Patron mailing, also known as Every Door Direct Mail, delivers a copy of the submitted piece to every mailbox within a certain area or route. Again, the selection of recipients is only a factor in counting the number of pieces for *electronic communications* per 2018 ETH 03. In this situation the elected official is still using public funds for the cost of materials or distribution for 50 or more pieces of substantially identical material (i.e., each piece of direct mail). The fact that the sender is not selecting the recipients is not a consideration in physical communications like legislative newsletters. As such, the Commission believes such a use of office funds would be prohibited under WIS. STAT. § 11.1205 if done by a covered official during the campaign period.

Additionally, the Commission would note an opinion issued by the Elections Board, 1976 Wis El Bd 16 (withdrawn December 6, 2016) that spoke to the practice of sending out legislative newsletters during the campaign period. While this opinion has been withdrawn by the Commission due to its references to laws that have since been repealed and recreated, this opinion considered the use of legislative office accounts to send out legislative newsletters under the prior iteration of the 50-piece rule and while it was not the central holding of the opinion, the Board did state that since distribution of 100 or more newsletters during the campaign period would be prohibited, distribution prior to the campaign period would presumably be allowed. While the language of the 50-piece rule has changed between 1976 and 2019 (notably moving the maximum number of pieces allowed from 99 to 49), the Commission believes this opinion demonstrates that the prior practice was for legislative offices to be restricted from such expenditures during the

¹ Many radio stations simulcast their broadcasts to the Internet. Consistent with 2018 ETH 03 we believe the simulcast, if known to and intended by the sender, would count as one additional piece.

campaign period and we see no evidence that in the various changes to the 50-piece rule over years the Legislature intended any different conclusion.

5. Can elected officials use office funds to promote their account, boost a post or take out legislative ads on social media platforms including Facebook, Twitter, and Youtube while under the "50-piece rule"?

- a) If so, how targeted can these be?

- 1) Can you target an ad to individuals only within your Legislative District?
- 2) Can you target an ad to individuals based on other criteria? (Individuals within a certain radius of an event? Individuals who follow other social media pages? Individuals that meet certain demographic criteria? ... see attached photos *FBad1* and *FBad2* for example of potential targeting)

6. Example #1:

- a) We hold regular monthly listening sessions around the district throughout the year
- b) For each listening session, we send out a news release, post the event on our website and create a Facebook event.
 - 1) Once under the 50-piece rule, we send press releases to fewer than 50 email addresses.
- c) If we are allowed to continue promoting these events on Facebook using office funds, those posts can reach hundreds or thousands of local residents.
 - 1) For example, one Facebook ad for a local listening session during the budget process, using \$250 from our office account, reached 8,996 residents in the [legislative district] and resulted in 170 rsvp's for that listening session.
 - 2) See attached *FBlisteningsession* and *FBlisteningsession2* graphics for an example of what those ads generally look like.
- d) Can we continue to use office funds to promote these listening sessions?

7. Example #2:

- a) We generally research policies and draft legislation in the summer and fall months of even numbered years.
- b) We will be rolling out a list of legislative priorities later this year and asking the public to weigh in on the list of policies that they'd like the legislature to focus on and prepare for.
- c) Can we promote a post soliciting feedback from the public on legislative priorities?
 - 1) i.e. "I'm working to ensure every family has access to quality health care, strong schools, safe roads and clean drinking water. Let me know what issues you'd like the state legislature to focus on."
- d) Can we promote a post that provides information to residents on relevant and timely legislative issue?
 - 1) i.e. "As children head back to school, many communities are struggling with teacher shortages, outdated facilities and a lack of state funding.

Visit *[legislative website link]* to learn more about what's being done to address these issues."

In order to answer these questions, a brief review of how the Commission understands these social media platforms to work at present is necessary as technology is constantly evolving. Facebook, Twitter, and YouTube each have "feeds" which show content to the user. A feed is created by the platform via an algorithm and largely consists of content that the user has either indicated they wish to see by liking, following, or subscribing to the content producer or by the platform placing the content in the user's feed due to other factors (e.g., demographics of the user, similarity to other content the user has viewed, etc.) It is important to note that a user does not see every piece of content from every content producer they like, follow, or subscribe to unless the user goes to that specific content producer's page on the platform. A content producer who wishes to expand the number of users who see the producer's content in their user "feed" can choose to pay the platform to place their content in more users' feeds.

There are multiple ways a content producer can expand their reach on social media platforms. On Facebook in particular, a content producer can choose to "boost" a post. A boost is essentially an advertisement consisting of the chosen post. After selecting a post to boost, the content producer can choose their audience through the following options (see FBad1):

- People you choose through targeting
 - Targeting options are extensive and include criteria like location, age, education, financial status, interests, behaviors, political affiliation, etc.
- People who like your Page
- People who like your Page and their friends
- People in your local area

After defining the intended audience, the content producer is then asked to set a duration for the ad and the total budget (see FBad2). Depending on the budget, Facebook estimates the number of users who will be reached per day and attempts to divide the total budget evenly across the entire duration of the ad. Facebook also permits content producers to create custom audiences from custom lists of phone numbers, email addresses, website cookies, etc.; although it is the understanding of the Commission that Facebook will not allow either targeting options or custom audiences that would narrow the potential audience for an ad to less than 50.

If the content producer would like to get more users to like their page (and thereby gain more viewers of their content via posts, instead of via paid advertising), another option is to "promote" the content producer's page. Promoting is essentially creating an advertisement for the content producer's page as a whole instead of just a particular post. These ads can then be tailored to a particular audience similar to selecting the audience for a boosted post and have similar duration and budget options.

The final option on Facebook is to simply place a traditional paid advertisement. These ads are not placed in the user's feed between posts, but instead are located in a static position elsewhere on the screen. Traditional ads have the same options for audience selection, duration, and budget.

You ask if elected officials can use their office accounts for these types of advertising (boosted posts, promoted pages, and traditional paid advertisements) on social media when under the 50-piece rule. Again, by its terms, the 50-piece rule prohibits officials from using public funds for the cost of materials or distribution of 50 or more pieces of substantially identical material during a campaign period. Wis. STAT. § 11.1205. Consistent with the Commission's prior advice in 2018 ETH 03, the Commission believes an official could continue to include a notice of a listening session on their legislative website, create a Facebook event, create a Facebook post about the session, and send a news release regarding the event out to up to 49 recipients when under the restrictions of the 50-piece rule. However, using legislative office funds to further promote those sessions via paid advertisement (boosted post, promoted page, or traditional paid advertisement) on social media during the campaign period, would be limited by the 50-piece rule as the official is paying to distribute substantially identical material multiple times. As such, a covered official may be able to boost a post or promote a page during the campaign period, but only to no more than 49 people, which may not be technically possible on the social media platforms described.²

B. Mixed Use Accounts

1. Can legislative staff manage and post content on "mixed use" social media accounts used by elected officials?

In 2012, the Government Accountability Board ("GAB") issued an informal advisory opinion on the use of social media by legislators and described its recommendations for best practices to avoid potential campaign finance and ethics violations. This letter was approved by the Government Accountability Board at its March 20, 2012 meeting. In this letter, the GAB advised that because state resources would be used to create and maintain official legislator social media pages, those pages may not be used for campaign or personal purposes.

Later in 2012, the Chief Clerks of the Legislature followed up their initial request with further questions on the permissible uses of social media by legislators and their staff. On October 11, 2012, the Director and General Counsel of the GAB issued a letter which reiterated the earlier guidance approved by the GAB and expanded into the topic of "mixed-use" sites such as a legislator's personal or campaign social media sites. The relevant advice is excerpted below:

With respect to the use of state staff and resources to create and post materials to the web or other social media pages that contain a mix of legislative and personal materials, including business and campaign materials, our advice is:

1. *State resources should not be used to create a website or Facebook page that will be used for mixed purposes.*
2. *Subject to paragraph 3, a legislator may post any type of content at any time to a website, Facebook page or other social media.*

² If the social media ad is substantially identical to either the notice on the legislative website, Facebook post, Facebook event, or news release, those instances of substantially identical communication are combined with the instances of the social media ad when tallying the 49 pieces allowable under the rule.

3. A legislator should **not** use state resources, such as a state computer, to post non-legislative content to a website, Facebook page, or other social media other than purely personal (not campaign or business) content.
4. **Legislative staff** may post **legislative content** to a mixed-use website, Facebook page, or other social media at any time, even if using state resources, but not to a campaign website, campaign Facebook page, or other forms of campaign social media. However, legislative staff should do this only with respect to materials that are distributed more broadly to the press and public.
5. **Legislative staff** may post **personal, business, or campaign content** to a mixed-use website, Facebook page, or other social media **only** on personal time and without using state resources.
6. Although a mixed-use website may contain a link to the legislator's official state webpage, a state webpage should not be linked to a mixed-use website, Facebook page, or other social media.

See the below table that was included in the GAB letter to illustrate permissible and impermissible activities:

Type of website	Legislative		Personal		Campaign		Business	
	Mr. State Rep. John Doe (Facebook)	John Doe (Facebook)	John Doe (Facebook)	John Doe (Facebook)	Don for Assembly (Facebook)	Don for Assembly (Facebook)	Don for Assembly (Facebook)	Don for Assembly (Facebook)
Legislator	Legislator	Staff	Legislator	Staff	Legislator	Staff	Legislator	Staff
Using State Resources	L Some P No C No B	L Some P No C No B	L Some P No C No B	L Some P No C No B	X	X		
On State Time	L Some P No C No B	L Some P No C No B	Any	L Some P No C No B	Any	Any	Any	X
Off State Time/On Personal	L Some P No C No B	L Some P No C No B	M	M	Any	Any	Any	Any
Use of the Wisconsin Legislature's Website	Yes		No		No		No	
Posting content from others	Yes		NA		NA		NA	
Notes	This is essentially a legislative resource							

Key
 L = Legislative post
 P = Personal post
 C = Campaign post
 B = Business post
 M = Mixed Content
 X = Not Allowed
 NA = Not applicable

It is the understanding of this Commission that paragraphs 1-3 of the above GAB advice was further adopted by the Chief Clerks and incorporated into their respective chambers' policy manuals for legislative staff. On June 21, 2018, the Ethics Commission re-iterated this advice in a letter to the Chief Clerks of the Legislature with the clarification that paragraph 2 only applied to posts to mixed-use websites/accounts and that official legislative social media accounts should only be used for official governmental purposes. A legislator's use of an official legislative social media account for campaign or business purposes, even when not using a state computer or on state time, could be a violation of WIS. STAT. § 19.45 (2) and (5).

Consistent with that prior advice, the Commission again advises that legislative staff may only post and manage legislative content on a mixed-use website or social media account while on state

time and may only post such materials to a mixed-use website or account that are distributed more broadly to the press and public. Legislative staff may only post personal, business, or campaign content to a mixed-use website or social media account on personal time and without the use of state resources.

2. Can elected officials with a "mixed use" social media account promote their account, boost a post or take out ads on Facebook/Twitter using office funds?

Reviewing the above table summarizing the advice provided by the Government Accountability Board and reaffirmed and further clarified by the Commission, it is clear that no person is authorized to use state resources to post campaign or business material. This is consistent with the general public purpose doctrine established by the courts in *State ex rel. Thompson v. Glessel*, 265 Wis. 207 (1953). This doctrine holds that expenditures of public money have to be made for a public purpose. However, the Commission does not make the determination of whether a given expenditure is for a public purpose. The proper way for such an issue to be decided is by way of a taxpayer civil action against the spending authority, which the courts would adjudicate, not this Commission.

It would logically follow that if legislative staff on state time can use state resources to post legislative content to a mixed-use social media account, state resources could also be used to boost or take out ads for such legislative posts on the mixed-use social media account. However, as legislative staff are only permitted to post such legislative content to a mixed-use social media account when the content is more broadly distributed to the media and the public, paying to boost or take out an ad for a post on a mixed-use social media account would not appear to be consistent with the original advice as it appears to contemplate that the post to the mixed-use account would be secondary to the original broader communication to the public and the media. Furthermore, as a general question as to the proper use of legislative resources, this is also a question that cannot be answered by the Ethics Commission alone and should also be directed to the Chief Clerk's Office.

Finally, because paid promotion of a mixed-use account as a whole could potentially benefit the official, their immediate family, or organizations with which the official is associated via the other content contained within and disseminated by that mixed-use social media account (i.e., business, campaign, etc.), the Commission advises against officials using state resources to promote mixed-use social media accounts as it could be a potential violation of Wis. STAT. § 19.45(2). This issue is further complicated by the potential for an official to later take a mixed-use account with them when they leave their public position, potentially retaining an asset of substantial value that was maintained or potentially even enhanced in value through the use of public resources.

Hi Dan,

Thanks for sitting down last week to talk more about our request. At this time, I'd like to clarify that our request is for an informal opinion. Below are a list of questions that we would like guidance on:

50 piece rule questions

Does one Facebook/Twitter post count as sending out one item regardless of how many individuals view or share it?

Can elected officials use office funds to take out a legislative ad in a local newspaper while under the "50 piece rule?"

Can elected officials use office funds to place a legislative radio ad while under the "50 piece rule?"

- o Are members restricted to 49 spots per ad?

Can an elected official use office funds to mail a legislative newsletter to a Postal patron route or "Every Door Direct Mail" list while under the "50 piece rule?"

- o (see USPS postal patron map attached)

Can elected officials use office funds to promote their account, boost a post or take out legislative ads on social media platforms including Facebook, Twitter, and Youtube while under the "50 piece rule?"

- o If so, how targeted can these be?

- * Can you target an ad to individuals only within your Legislative District?
- * Can you target an ad to individuals based on other criteria? (Individuals within a certain radius of an event? Individuals who follow other social media pages? Individuals that meet certain demographic criteria? ... see attached photos FBad1 and FBad2 for example of potential targeting)

Example #1:

- o We hold regular monthly listening sessions around the district throughout the year

- For each listening session, we send out a news release, post the event on our website and create a Facebook event.
 - Once under the 50 piece rule, we send press releases to fewer than 50 email addresses.
- If we are allowed to continue promoting these events on Facebook using office funds, those posts can reach hundreds or thousands of local residents.
 - For example, one Facebook ad for a local listening session during the budget process, using \$250 from our office account, reached 8,996 residents in the [REDACTED] District and resulted in 170 rsvp's for that listening session.
 - See attached *FBlisteningsession* and *FBlisteningsession2* graphics for an example of what these ads generally look like.
- Can we continue to use office funds to promote these listening sessions?

Example #2:

- We generally research policies and draft legislation in the summer and fall months of even numbered years.
- We will be rolling out a list of legislative priorities later this year and asking the public to weigh in on the list of policies that they'd like the legislature to focus on and prepare for.
- Can we promote a post soliciting feedback from the public on legislative priorities?
 - i.e. "I'm working to ensure every family has access to quality health care, strong schools, safe roads and clean drinking water. Let me know what issues you'd like the state legislature to focus on."
- Can we promote a post that provides information to residents on relevant and timely legislative issue?
 - i.e. "As children head back to school, many communities are struggling with teacher shortages, outdated facilities and a lack of state funding. Visit [REDACTED] to learn more about what's being done to address these issues."

"Mixed Use" accounts (social media accounts containing a mix of legislative and campaign content)

- Can legislative staff manage and post legislative content on "mixed use" social media accounts used by elected officials?
- Can elected officials with a "mixed use" social media account promote their account,

boost a post or take out ads on Facebook/Twitter using office funds?

Again, happy to chat more or clarify any of these requests if you or your staff have questions.

Thanks,

Good afternoon,

This email is to acknowledge receipt of your opinion request. As you are probably aware, the Commission is meeting on Tuesday, August 20, 2019. As we are within a few business days, we will not be able to prepare the opinion you requested in time for this meeting. The next regularly scheduled meeting of the Wisconsin Ethics Commission is December 3, 2019. A formal opinion can definitely be prepared and deliberated by the Commission at that meeting.

After the Commission's meeting on Tuesday, we will begin working on this request. I anticipate that we will be requesting some additional information from you at that point. Until then, should you have any questions or need anything further, please don't hesitate to contact me.

Sincerely,

Dan

Subject: Social Media Guidance

Hello,

I would like to request a formal opinion from the ethics commission regarding the use of

social media accounts by legislative offices. In particular, I would like official guidance from the commission on the following matters:

- **Wisconsin's "50 piece rule"**

- Does one Facebook/Twitter post count as sending out one item regardless of how many individuals view or share it?
- Can elected officials use office funds to promote their account, boost a post or take out legislative ads on Facebook/Twitter while under the "50 piece rule?"
- Do legislative social media accounts not associated with a specific official fall under any "50 piece rule" restrictions? (i.e. "Senate Republicans" @WICOPSenate or "WI JFC Democrats" @JFCDemocrats)

- **"Mixed Use" accounts**

- Can legislative staff manage and post content on "mixed use" social media accounts used by elected officials?
- Can elected officials with a "mixed use" social media account promote their account, boost a post or take out ads on Facebook/Twitter using office funds?

- **Blocking/banning users and deleting/hiding content**

- Can legislators block/ban individuals who use profane or threatening language from following their official social media accounts?
- Can legislators block/ban members of the public from viewing or following "mixed use" social media accounts?
- Can legislators delete or hide public comments on their official social media account if they are deemed to be profane, threatening, or campaign related?

I appreciate your consideration of these issues and would be happy to answer any questions or provide additional clarification of these requests if needed.

Thank you,

- [REDACTED]

Wisconsin Ethics Commission

For persons elected to state or local office who become a
candidate for national, state, or local office

Social Media Use by Officials

GENERAL GUIDANCE

The Code of Ethics for State Public Officials prohibits the use of an official's public position for private benefit. WIS. STAT. § 19.45(2). As such, it is important for an official to be able to distinguish between a public purpose and a private purpose when considering the use of public resources. To avoid the appearance of misuse of public resources a public official should include some indication of whether a social media account is for their official position or is a campaign, business, or personal account in the profile, summary, or other description of the account.

Best Practices for Official Social Media Accounts

Official social media accounts are the most restricted. Officials should limit use of their official social media accounts to information related to an official's position, duties, and issues with a public purpose.

Examples of acceptable communications from an official social media account:

- Posts discussing how the state could address an issue through state laws or actions;
- General legislative activity like information about bills that the official has sponsored or co-sponsored;
- State budget information;
- Sharing newsletters from the official's office;
- Publicizing public events;
- Public service announcements and;
- Endorsements and messages of support when justified by having a state purpose. For example: "I support [candidate or organization] and their work to address [state policy issue] in Wisconsin."

Examples of communications that should NOT come from an official social media account:

- Solicitation of campaign contributions;
- Promotion of campaign-related events;
- Photos of campaign-related branding and events such as T-shirts, signs, or banners; and
- Any content that is strictly personal or commercial such as promoting the official's personally owned business or a business with which the official is associated.

See WIS. STAT. §§ 11.1208(2)(a), 19.42(2), 19.45(2).

Best Practices for Campaign and Personal Social Media Accounts

A campaign may use a campaign social media account for all communications allowable for an official account, in addition to campaign-related activities including solicitation of contributions. Campaign social media accounts should not be used for strictly personal or commercial purposes. *See* WIS. STAT. § 11.1208(2)(a).

A personal account may contain both official and campaign-related information.

Please see the diagram to the right for an illustration of acceptable uses by type of account.

USE OF SOCIAL MEDIA ON “STATE TIME”

Elected officials will often switch between official and campaign activities throughout the day because an elected official is simultaneously an official and a candidate. WIS. STAT. § 11.010(1). However, to avoid the appearance of misuse of public resources an elected official is advised not to create campaign-related social media communications or content while performing their official duties (i.e., while participating in an event in their official capacity – e.g., an event listed on their official calendar, a floor session, or committee hearing). WIS. STAT. § 19.43(2). Also, no person may enter or remain in any state building, office, or room for the purpose of requesting or collecting a contribution; therefore, elected officials should take special care as to the content of their social media communications while in a state building. WIS. STAT. § 11.1207(4).

An elected official is also advised to not use campaign committee resources for strictly personal benefit, or for commercial purposes. WIS. STAT. §§ 11.1208(2)(a), 19.43(2), 19.42(2). For example, the candidate should not use a campaign social media account or campaign website to advertise for a personal business.

50-PIECE RULE APPLICATION TO SOCIAL MEDIA

The “50-Piece Rule” prohibits the use of public funds for the distribution of 50 or more pieces of substantially identical material by a covered person during a specified time period. WIS. STAT. § 11.1203. The language of the “50-Piece Rule” does not distinguish between electronic pieces and printed pieces. Electronic communications almost always result in multiple copies being created even when sent to a single recipient. This is due to the nature of the technical systems that enable electronic communications. When calculating the number of pieces distributed under the “50-Piece Rule” the Commission will only count those instances of electronic communication intended by the sender. *See* 2018 ETH 03.

If a message is actively communicated to individually addressed recipients (e.g., via email, instant messages, or direct messages), each individual recipient is considered a single piece under the “50-Piece Rule.” However, a passive message such as a website, Facebook post, or tweet, where the sender has no direct control over the audience of his or her message, is only counted as a single piece under the “50-Piece Rule.”

DAVISON VS. RANDALL , NO. 17-2002 (4TH CIRCUIT COURT OF APPEALS), is not binding
precedent in the Eastern District of Wisconsin

Davison was issued on 1/19/2019 in final form.

P. Rogers, LOUDON COUNTY ATTORNEY, Leesburg, Virginia, for Appellant/Cross-

WHICH COURT IS BINDING?¹

Binding vs. Persuasive Cases

© 2017 The Writing Center at GULC. All rights reserved.

You have found the perfect case: the facts are similar to yours and the law is on point. But does the court before which you are practicing (or, in law school, the jurisdiction to which you have been assigned) have to follow the case? *Stare decisis* is the common law principle that requires courts to follow precedents set by other courts. Under *stare decisis*, courts are obliged to follow some precedents, but not others. Because of the many layers of our federal system, it can be difficult to figure out which decisions bind a given court. This handout is designed to help you determine which decisions are mandatory and which are persuasive on the court before which you are practicing.

Binding versus Persuasive Authority: What's the Difference?

- *Binding authority*, also referred to as mandatory authority, refers to cases, statutes, or regulations that a court **must** follow because they bind the court.
- *Persuasive authority* refers to cases, statutes, or regulations that the court may follow but does not have to follow.

To get started, ask yourself two questions:

- 1) Are the legal issues in your case governed by state or federal law? and
- 2) Which court are you in?

Once you know the answers to these questions, you are well on your way to determining whether a decision is mandatory or persuasive.

Step 1: Are the Legal Issues in Your Case Governed by Federal or State Law?

First, a lawyer needs to know the facts and issues of the case. Facts such as where the events took place, where the home(s) of the parties are, and where the parties conduct most of their business frame the legal issues. In other words, identifying key facts will help you to determine what law governs the legal issues in your case.

The hypothetical case below illustrates how you might analyze a particular set of facts to identify whether the legal issues are governed by state or federal law. The first step is to identify the facts and brainstorm all the possible legal issues raised by those facts.

¹ By Robyn Painter and Kate Mayer. Revised in 2017 by Kate Mathews.

Hypothetical Case: Pick-Pocketing in Virginia

<i>Facts</i>	<i>Possible Legal Issues</i>
• You are shopping in a grocery store in Virginia when a little old woman in line at the checkout starts screaming that she's been pick-pocketed. • The police arrive on the scene, and the woman identifies you as someone who suspiciously brushed against her. • The police arrest you and throw you in jail. • Later, the police interrogate you without first informing you of your right to have a lawyer present.	• Is pick-pocketing a crime in Virginia? If so, under what law? • Did the police have probable cause to arrest you based on the identification of the old woman? • How reliable was the old lady's identification? • How long can the police hold you? • Were any of your Constitutional rights violated during the police's arrest and interrogation of you? • If you are found guilty, can the little old lady also sue you in civil court for infliction of emotional distress or another tort?

After you have brainstormed all the possible legal issues the facts raise, determine whether the legal issues are governed by federal or state law. In any given case, there may be both federal and state issues. America operates on a system of dual sovereignty: the fifty states and the federal government all retain their own sovereignty. Because each state is a sovereign, each state sets its own laws and has its own Constitution. In addition, the United States federal government makes laws and has a Constitution.

When determining whether a legal issue is governed by federal or state law, keep in mind that some areas of the law, such as criminal and environmental law, are governed by both state and federal laws. Generally, the principle of **preemption** means that a legitimate federal action supersedes a state law in certain cases. Although a full discussion of preemption is beyond the scope of this handout, you should be aware of some basic principles. Federal law preempts state law when the two laws conflict, when Congress expressly or implicitly says so, or when federal laws are so pervasive that they occupy the entire field of law.

Hypothetical Case: Pick-Pocketing in Virginia

There is no preemption issue in your case because there is no conflict between state and federal law such that federal law would override Virginia state law. Specifically, there is no federal law prohibition against pick-pocketing that could conflict with Virginia's local pick-pocketing law. So, two sets of laws potentially govern.

<i>Federal Issues</i>	<i>State Issues</i>
• <i>Your Fourth, Fifth, and Sixth Amendment rights were triggered once you were arrested—these rights are governed by federal law, i.e., the U.S. Constitution.²</i>	• <i>Virginia's or the town's local pick-pocketing statute will lay out the elements of and punishment for the offense; the court's decision in your case will also be informed by state cases about pick-pocketing.</i> • <i>Your arrest might also implicate Virginia's state Constitution—state Constitutions must provide at least as many rights as the Federal Constitution, but can also entitle you to broader protections.</i>

In sum, your case involves legal issues governed by both state and federal law.

Step 2: Which Court Are You In?

Next, determine which court you are in, which is a two-part inquiry.

(1) First, ask yourself whether you are in federal or state court.

Dual sovereignty means that each sovereign has its own court system: the states each have courts and the United States has courts, which are called federal courts. Federal courts are located throughout the United States.

(2) Second, ask yourself whether you are in a trial court, an intermediate appellate court, or a supreme court.

Most American court systems—whether they are federal or state—have a similar structure, consisting of trial courts, intermediate appellate courts, and the highest court in the jurisdiction, usually supreme courts. In the federal court system, the trial courts are called United States District Courts. There are twelve federal courts of appeals that each cover a geographical region called a circuit and are, accordingly, called the United States Court of Appeals for the [insert number] Circuit or Circuit Courts.³ States vary in the names they give to their courts, but regardless of the nomenclature, the structure is the same.⁴

² Usually, there are state cases adopting Federal Courts' interpretation of the Constitution. If this is so, you should cite your state case. Be careful, though, to check and see if there are any new federal decisions governing basic Constitutional rights surrounding your case.

³ Additionally, there is a thirteenth federal appellate court called the Court of Appeals for the Federal Circuit, which unlike the regional Circuit Courts of Appeal, has nationwide jurisdiction to hear appeals in only certain types of cases including cases involving patent laws and cases appealed from the U.S. Court of Federal Claims and the U.S. Court of International Trade.

⁴ In some states, such as New York and Maryland, the highest court in the state is actually called the Court of Appeals.

Hypothetical Case: Pick-Pocketing in Virginia

In your case, the local police arrested you. These police were acting under the authority of the Virginia state or local statute against pick-pocketing. Thus, at this point, you are in a Virginia state trial court. Realize, though, that even though you are in a state court, the federal Constitutional issues you identified in step 1 can still be heard by that court.

If you lose at trial and need to appeal, that appeal will go to Virginia's intermediate appellate court, and then to Virginia's highest court, the Virginia Supreme Court. Only if you lose at the state's highest court and believe that the state law violates the U.S. Constitution can you appeal to the U.S. Supreme Court.

If you had been arrested by the FBI or for a federal offense, then you could be tried in federal district court, perhaps in the U.S. District Court for the Eastern District of Virginia. If the case were appealed, it would go to the U.S. Court of Appeals for the Fourth Circuit, then to the U.S. Supreme Court.

In sum, at this point, your case is in a state trial court for the purpose of determining whether a particular case is binding or persuasive.

NOW YOU ARE READY! Is the case you have found binding or persuasive?

Now that you have found a case on point, some general principles will help you to figure out whether a law is binding or persuasive. Use your answers to the above questions to apply these principles to your case.

 First, **higher courts bind lower courts** within their particular state or circuit. With the exception of the U.S. Supreme Court, courts of appeals and state courts do not bind courts outside the state or circuit in which they are located. That is, a federal Supreme Court decision is binding on all lower federal courts, both circuit courts of appeals and district courts. A federal circuit decision is binding on all federal district courts within its circuit, but not federal courts in other circuits. For example, a decision of the U.S. Court of Appeals for the Ninth Circuit binds the U.S. district courts within the Ninth Circuit, but not federal courts in any other circuit. However, a district court or trial court decision would not bind higher courts. A decision by a state's highest court is binding on all appeals courts and trial courts in that state, but not on state courts in other states, and usually, a state court of appeals' decision binds state trial courts in that state.⁵

 Second, with the exception of the U.S. Supreme Court, **federal courts bind only other federal courts, not state courts**. Thus, a decision by the U.S. Court of Appeals for the Ninth Circuit, a federal court, is binding on federal district courts within the boundaries of the Ninth

⁵ Although some states have appellate courts that bind all lower courts in the state, others have regional districts or circuits and a state appellate court may bind only lower courts within its geographic district or circuit. Therefore, be sure to research the structure of the courts in your particular state. <http://www.law.cornell.edu/abw/p-conion/finalpdf/2018/07/Matthews-Schaffler-Federal-law-federal-courts-and-binding-and-persuasive-authority.pdf>

X Circuit. It is not binding on California state courts, even though California is geographically within the Ninth Circuit. Similarly, **state courts bind only other state courts within the state.** A decision of the California Supreme Court would thus bind other California state courts, not state courts in any other state. However, sometimes a federal court must apply a state's law. In that case, the state's interpretation of that law is binding on the federal court. Therefore, a California Supreme Court decision on a matter of California law would bind federal courts on that state law issue. Similarly, state courts must sometimes decide issues of federal law, but they are not bound by federal courts except the U.S. Supreme Court. A decision of the U.S. Supreme Court, a federal court, is binding on state courts when it decides an issue of federal law, such as Constitutional interpretation.

Hypothetical Case: Pick-Pocketing In Virginia

<i>Federal Issues</i>	<i>State Issues</i>
• The Constitutional issues are federal. The state trial court is thus bound by the U.S. Supreme Court's decisions about the Constitutional issues in your case. • Any decisions from other federal courts other than the U.S. Supreme Court are persuasive authority on the federal law issues. • Note that if you had been accused of a federal offense, you probably would have appeared in a federal district court, which would have been bound by the court of appeals for your circuit (i.e., the Fourth Circuit), and the U.S. Supreme Court on all federal issues.	• The Virginia state trial court in which your case will be heard is bound by Virginia courts of appeal and by the Virginia Supreme Court on all state issues. Because the pick-pocketing law is a state law issue, the state's courts of appeals and state supreme court decisions will bind the state trial court you are in. • All other court decisions are persuasive authority on the state law issue—that is, decisions from all federal courts, other states' state courts, and other state trial courts in the same state.

Applying this analysis from the outset will help you to be a smarter, faster researcher and to narrow down the body of case law at which you are looking. Knowing what the court is bound to follow will help you to write more effective memos, motions, and briefs.

For a more detailed discussion of binding and persuasive authority at the federal level, see the Writing Center's handout, "Federal Law, Federal Courts, and Binding and Persuasive Authority." Also, for a discussion about using persuasive authority in your legal writing, see the following handout: "When and How to use Secondary Sources and Persuasive Authority to Research and Write Legal Documents."

The table below displays the above principles in another form. Use your answers from Steps 1 and 2—whether the issue is state or federal and which court you are in—to find the box in the

left hand column that applies to your case. Then, read across that row to find out which courts bind you and which courts are only persuasive to you.

1) State or Federal Issue? 2) Which court are you in?	Binding Authority	Persuasive Authority
State issue in state trial court	That state's state appeals court That state's highest court	All federal courts Other states' state courts Other state trial courts in the same state
State issue in state appeals court	That state's highest court	All federal courts Other states' state courts State trial courts in the same state Other state courts of appeals in the same state
State issue in state's highest court	N/A	That state's highest court State trial courts in the same state State courts of appeals in the same state Other states' state courts All federal courts
State issue in federal district court	Interpretations from the state's highest court	All federal courts Other state courts
State issue in federal circuit court	Interpretations from the state's highest court	All federal courts Other state courts
State issue in U.S. Supreme Court	Interpretations from the state's highest court	All federal courts Other state courts
Federal issue in state trial court	U.S. Supreme Court That state's court of appeals That state's highest court	All federal district courts All federal circuit courts State courts
Federal issue in state appeals court	U.S. Supreme Court That state's highest court	All federal district courts All federal circuit courts State courts
Federal issue in state's highest court	U.S. Supreme Court	All federal district courts All federal circuit courts State courts
Federal issue in federal district court	U.S. Supreme Court Federal circuit court in the circuit where the district court is	Other federal circuit courts Federal district courts All state courts
Federal issue in federal circuit court	U.S. Supreme Court	That federal circuit court Other federal circuit courts Other federal district courts All state courts
Federal issue in U.S. Supreme Court	N/A	U.S. Supreme Court All federal circuit courts All federal district courts All state courts

* Technically, courts of the same level do not bind each other. Thus, the U.S. Supreme Court may overturn its prior decisions, though it has adopted different practices of *stare decisis* for its constitutional precedents and its precedents interpreting federal statutes. For a discussion of *stare decisis* practices of the U.S. Supreme Court, see Amy Coney Barrett, *Statutory Stare Decisis in the Courts of Appeals*, 73 GEO. WASH. L. REV. 2 (2005). Further, although federal circuit courts technically do not bind themselves, nearly every circuit court has adopted a strong rule of *stare decisis*, or "law of the circuit" rule, under which the holding of a published decision by a three-judge panel of the circuit binds subsequent panels. Joseph W. Mead, *Stare Decisis in the Inferior Courts of the United States*, 12 NEV. L. J. 787, 794-95 (2012). Therefore, in practice, a published circuit court opinion is generally binding on that court. *Id.* However, "law of the circuit" rules vary slightly by circuit. *Id.* at 797.

My name is John S. Vander Loest. I ran for Green Bay City Council in 2013 and created a Facebook election page in Fall 2013. I was not elected in Spring 2014 but continued to use the Facebook election page in 2016 when I ran again for Green Bay City Council. I was elected to the Green Bay City Council in April 2016. I regularly used the John S. Vander Loest for City Council Facebook page to communicate with supporters who liked my election page.

I used the Facebook election page for my election updates, updating my supporters on items that concerned me, personal/family updates and other local interest items that my supporters cared about.

The Facebook page was operated as a campaign page. At no time did I operate it as an official city page. No city taxpayer dollars were used to maintain the John Vander Loest for City Council Facebook site.

If parties attacked me in posts, name called other parties, made comments that were off topic, I would remove these related Facebook comments. For example, I deleted posts similar to the following:

1 Off topic comments on a post related to the Spring 2020 election process.

2 Name calling. Referred to as a schmuck. Also, derogatory terms used toward other parties polling.

3 Negative remarks about my business interests.

In mid-April 2020, Attorney Chaves indicated that Facebook comments on the election page should not be removed nor should anyone be blocked/restricted from the Facebook page. Upon that recommendation was made, I have completely complied with Chaves's recommendation. I have not blocked/restricted any individuals or removed any comments from any social media post.

Before from Attorney Chaves's advice in April 2020, I had never received any communication from the City attorney's office, other city staff or any other related provider on rules or guidelines regarding social media use by public officials.

Alderman John S. Vander Loest

HOW TO TELL IF YOU HAVE BEEN BLOCKED ON FACEBOOK

On the page, no "like" button will be present to follow the page, and no "like" or "comment" buttons will be available, cutting off all interaction with the page.

Facebook offers a "Town Hall" feature that shows you your elected officials based on your street address. You then have the ability to follow those officials' pages and get their mailing address, email and phone #.

When blocked by Alderman Vander Leest (shown at left), no option to follow the page exists, preventing you from getting new content from the alderman in your news feed, and barring you from interacting with the conversation that happens there.

ALDERMAN VANDER LEEST BLOCKS MARK ZAHN (AUG '17)

Green Bay City Council - John S. Vander Leest
August 13, 2017

Green Bay is one of the highest taxed communities in NE Wisconsin. We spend over \$100 million dollars in our City budget. I'm working on the property tax issue through a Budget task force to hold property taxes down for the City of Green Bay.

We need to prioritize our current spending to devote more resources to road construction and maintenance. We don't need a wheel tax to tax you further.

The wheel tax is a bad idea and would have started at \$20 and continued to climb to +\$50 plus or more to solve the City's spending problems. That's what government does with a new tax. It would start small then grow larger over time.

I voted NO. We must do better for taxpayers. What do you think?

Most Relevant

In August of 2017, Alderman Vander Leest posted a link to an article about the "wheel tax" that the city was debating at the time. He offered his stance on the matter and then concluded by asking "What do you think?" This is clearly an elected official seeking public comment on a city issue. I offered my input on the matter as a vocal supporter of the wheel tax. I have known people who have been devastated by special assessments of tens of thousands of dollars. Even though I knew he wouldn't agree with my stance, I expected him to at least consider my opinion.

Mark David Zahn I strongly disagree with your vote on this issue. I would have happily paid \$20-\$50 per year rather than an unexpected several thousand dollars in one go. The whole "holding the line on property taxes" thing is bluster and farce. The city fire department uses my street as a shortcut route and the constant back and forth of those huge trucks badly beats up on our street and it takes forever for it to get patched up. I was really hoping this would have passed, but I already knew I couldn't count on your vote on this.

Author

Green Bay City Council - John S. Vander Leest The city would jack up the \$20 wheel tax to cover more spending and waste. I believe it would be \$40 per vehicle or more in a few years. That's what government does.

Shortly after his rebuttal, and before I had a chance to continue the debate, Alderman Vander Leest blocked me from participating in his Facebook page with no explanation or warning whatsoever - a ban that continued well into 2020. This prevented me from posting, commenting and "liking" his posts, and also prevented me from seeing his content in my regular news feed.

I strongly believe this act prevented me from exercising my First Amendment rights to participate in the exchange of ideas in this public forum, and also my right to petition my elected official on matters that affected me as a taxpayer in the City of Green Bay. While there are certainly other ways for one to contact their alderperson, the fact that Mr. Vander Leest solicits input from constituents and excludes those who have views that differ from his own inaccurately paints a picture of support, slanted to his own political preference. This act of ill-will from one's own elected representative puts a chilling effect on speech and effectively closes the lines of communication. I have no trust that if I would make a phone call to Mr. Vander Leest about a simple issue like a pothole that he would even work on my behalf.

Mr. Vander Leest has said in the past, "I'm here to represent all the people of the district." In a March 2020 newspaper profile, he stated, "I listen to residents of my area and know what is important to them." I believe his actions clearly show he has no intention of "making the public feel welcome" or conveying to the public his "respect and appreciation for the public's participation, input, and opinions" as the city's own Code of Conduct for Elected Officials mandates. His conduct during his time in office demonstrates anything but fairness, openness and willingness to work for all he represents. I have no ill-will towards Mr. Vander Leest. On the contrary, I want nothing more than to have a fruitful relationship with my public officials and have the ability to have my viewpoints not only heard but genuinely considered. This has nothing to do with an election and I'm not looking to run him out of office. But I do expect more of my elected officials and I wish for him to take responsibility in this matter and commit to respecting all his constituents' Constitutional rights.

— Mark Zahn, 4/23/20

CLAIM THAT PAGE IS A "CAMPAIGN PAGE"

After deleting user Jon Schultz's comments (and prior to blocking him) Alderman Vander Leest claimed that the page is a "campaign page," in an apparent attempt to portray the page as not being subject to First Amendment protections as an official page of an elected official.

On April 10, 2020, all 115 posts on Alderman Vander Leest's page were analyzed for campaign and non-campaign-related content. Only 25 posts, or 22% of the page's content (boxed in green), is related to his campaign or elections in which he was on the ballot. The remaining 78% of content contains posts reflective of an elected alderman:

tax issues, the local business environment, COVID-19, public works, loose leaf pickups, city budgets, listening sessions, district crime alerts, seeking input on paid volunteerism by city employees, community events, public notices, advertising his official city e-mail and phone number, and asking for input on a proposal he authored that failed in council voting.

Before the Ethics Board
of the City of Green Bay

Tarl Knight, Complainant

vs.

John S. Vanderleest
Respondent

MOTION TO SPECIFY PLAINTIFF'S CLAIM WITH PARTICULARITY AND CLARITY

The respondent, by his attorney, Robert J. Miller moves as follows:

1. That the plaintiff be required to state, in writing, with particularity and clarity how **Davison vs. Randall** (17-2002), a 4th Circuit Court of Appeals case, binds and requires an alderman in Green Bay, Wisconsin to conform with its dictates. More simply stated, the plaintiff should explain why and how the **Davison** case applies to Green Bay, Wisconsin and the City Council's Code of Ethics.

Dated this 31st day of August 2020

Robert J. Miller

Robert J. Miller
Attorney for Alderman J. Vanderleest
227 S. Van Buren St.
Green Bay, WI 54301
920 853 6455

TARL KNIGHT
Complainant

vs.

JOHN S. VANDERLEEST
Respondent

ARGUMENT

The formal complaint which I, the Complainant, filed against the Respondent accuses the Respondent of having continuously blocked well-meaning constituents' and taxpayers' social media accounts, as well as deleting relevant posts and comments posted by them to their local representative's official government social media account, which has been declared a "public forum" by several prominent federal First Amendment cases. Such material as has been blocked and/or deleted by the Respondent was concerning serious, community-related issues (such as opinions and suggestions relating to proposed taxes, proposed construction projects, and proposed alternative parking methods), and had not contained any amount of profanity or insulting material, all of which the aggrieved parties will corroborate and a particular instance of which has already been submitted.

Regarding the issue of standing, Section 8 of the City of Green Bay Code of Conduct clearly states "any person" may file a formal complaint provided they satisfy the listed conditions:

Any person who believes a [sic] Elected official, in his/her official capacity, has violated a requirement, prohibition, or guideline set out herein may file a sworn complaint with the City Clerk identifying (1) the complainant's name, address and contact information; (2) the name and position of the City official who is the subject of the complaint; (3) the nature of the alleged violation, including the specific provision of the Code allegedly violated, and (4) a statement of facts constituting the alleged violation and the dates on which, or period of time during which, the alleged violation occurred.

The formal complaint concerns the Complainant as well as any taxpaying members of the community. The material at issue will be further specified by the aggrieved parties if afforded the opportunity. Until the respective parties are permitted to testify further as to the content of the deleted posts and comments, the Respondent's strawman argument of the material at issue

containing illicit or injurious statements, and so permitting deletion, are yet completely invalidated.

The conduct at issue, blocking and/or deleting citizens' well-meaning, relevant posts and comments regarding city issues, clearly violates the basic standards set by the City of Green Bay's Code of Conduct for public officials and their government social media accounts, which have been declared to be public forums by multiple federal First Amendment cases, such as *Knight First Amendment Institute vs. Trump* (2019) and *Davison vs. Randall* (2019).

Only last year, federal courts affirmed public officials' social media accounts to indeed constitute public forums, citing *Davison vs. Randall* (2019):

"Public officials may not retaliate against speech they dislike by suppressing expression on social media... The suppression of critical commentary regarding elected officials is the quintessential form of viewpoint discrimination against which the First Amendment guards."

Further, citing *Knight First Amendment Institute vs. Trump* (2019):

"[T]he First Amendment does not permit a public official who utilizes a social media account for all manner of official purposes to exclude persons from an otherwise open online dialogue because they expressed views with which the official disagrees."

Section 1 of the City of Green Bay Code of Conduct states:

[M]embers of the Common Council and Mayor shall maintain the utmost standards of personal integrity, trustfulness, honesty, and fairness in carrying out their public duties, avoid any improprieties in their roles as public servants, comply with all applicable laws, and never use their City position or authority improperly or for personal gain.

Section 4 of the City of Green Bay Code of Conduct states:

No signs of partiality, prejudice, or disrespect should be evident on the part of individual Council members toward an individual participating in a public forum. Every effort should be made to be fair and impartial in listening to public testimony. The Council members are expected to demonstrate, both publicly and privately, their honesty and integrity, and to be an example of appropriate and ethical conduct. All Council members should convey to the public their respect and appreciation for the public's participation, input, and opinions.

The Complainant maintains the actions of the Respondent have constituted habitually suppressive behaviour, which automatically and categorically violates the City of Green Bay's Code of Conduct, and similar actions by public officials violating the First Amendment have been criticised by multiple federal authorities throughout the years. The formal complaint filed against the Respondent holds merit, and the Complainant urges for any aggrieved parties outlined by the formal complaint to have the opportunity to testify as proof.

Thank you,

BEFORE THE CITY OF GREEN BAY
ETHICS BOARD

In the Matter of the Complaint Against Alder VanderLeest

Respondent

By Tarl Knight

Complainant

SCHEDULING ORDER

1. At a duly scheduled and properly noticed public meeting, on Tuesday, September 1, 2020 at 5:00 pm this matter came before the City of Green Bay Ethics Board (Board) for a scheduling conference.
2. Complainant was present at the meeting as was Respondent and his counsel Robert Miller. A quorum of the Board was present, represented by James Kalny.
3. After consideration, and discussion with the parties, upon motion duly made and seconded the Board directed counsel to issue a scheduling order under the signature of the Board Chair, directing the following:
 - a. On or before September 11, 2020 the parties shall exchange:
 - i. a list of all witnesses they intend to call at the hearing of this matter
 - ii. copies of all documents that are intended to be introduced in the hearing of this matter.
 - iii. Mr. Kalny shall contact the parties to coordinate this exchange.
 - b. On or before close of business on September 18 any procedural/evidentiary motion shall be filed with the City Clerk. Any amendment to the complaint will also be due at that time.
 - c. Responses to such motions shall be filed with the City Clerk on or before close of business September 25, 2020.
 - d. Also before close of business on September 25, , all subpoena's required by the parties shall be requested in writing filed with the City Clerk. The clerk shall forward the requests to the Board Chair who draft and execute subpoenas for the requesting party. The Party will be responsible for the service of the subpoenas.
 - e. The Board will notice a meeting and convene the hearing of this matter for the purpose of hearing any motions on October 7, 2020 at 5:00 pm.

- f. The evidentiary hearing of this matter shall be held on October 28, 2020 at 5:00 pm.

DATED in Green Bay, Wisconsin, this 4th day of September, 2020.

Friends and Constituents,

I've been asked how to call into the City Council meeting to give public comments about the voting failures at the spring election in Green Bay. The meeting starts at 6 PM tonight.

Attached is the Zoom information on how to log in. You can call in with a regular phone or with a smartphone you can watch the video on Zoom.

There will be an election report by the City Clerk at the beginning of the meeting and the floor will be suspended to allow the public to speak. This is on the agenda -

K. Report on April 7, 2020 Election

To enter the zoom meeting call 312 626 6799, enter meeting ID: 929 7972 2711 and Password: 029320

I've attached the GB City Council agenda below too.

Let me know if you have any questions. Good government is one that is involved and holds its government accountable.

Wendy J. Coriell I find it rather cute how you pretend to care about the constituency and all the people of Green Bay instead of your career and power hold and now how all of a sudden you're pretending to be tech support for Zoom and pretend to be in favor of government transparency. What a joke. You don't even come close to standing for transparency, honesty, or the will of the constituency.

"I'm not a savvy computer person," said Vander Leest, who had the county route his emails to his personal account in 2016. "I check my email three or four times a week to stay involved with city and county business, and to respond to constituents."

"But the use of commercial email services by some isn't the only thing some supervisors do to create risks, spur ethics questions and raise concerns among open government advocates, fellow supervisors and the county's chief technology officer."

ALDERMAN VANDER LEEST BLOCKS MARK ZAHN (AUG '17)

Green Bay City Council - John S. Vander Leest
August 16, 2017

Green Bay is one of the highest taxed communities in the Wisconsin. We spend over \$100 million dollars in our City budget. We're working on the property tax issue through a Budget task force to hold property taxes down for the City of Green Bay.

We need to provide our current spending to develop more resources to road construction and maintenance. We don't need a wheel tax to tax you further.

The wheel tax is a bad idea and would have started at \$20 and continue to climb to \$50 plus or more to solve the City's spending problems. That's what government does with a new tax. It would start small then grow larger over time.

I voted NO. We must do better for taxpayers. What do you think?

http://www.greenbaywisconsin.com/news/2017/08/16/alders-vote-on-wheel-tax/

Proposed Green Bay wheel tax runs out of gas

Proposed Green Bay wheel tax

In August of 2017, Alderman Vander Leest posted a link to an article about the "wheel tax" that the city was debating at the time. He offered his stance on the matter and then concluded by asking "What do you think?" This is clearly an elected official seeking public comment on a city issue. I offered my input on the matter as a vocal supporter of the wheel tax. I have known people who have been devastated by special assessments of tens of thousands of dollars. Even though I knew he wouldn't agree with my stance, I expected him to at least consider my opinion.

Mark David Zahn I strongly disagree with your vote on the issue. I would have happily paid \$20 per year rather than an unexpected several thousand dollars in one go. The whole "holding the line on property taxes" thing is bluster and force. The city's department takes my street as a shortcut route and the constant back and forth of those huge trucks badly beats up on our street and it takes forever for it to get patched up. I was really hoping this would have passed, but I already knew I couldn't count on your vote on this.

Like Reply

Green Bay City Council - John S. Vander Leest
The city would pick up the \$20 wheel tax to cover more spending and assets. I believe it would be \$40 per vehicle or more as it rises years. That's what government does.

Like Reply

Shortly after his rebuttal, and before I had a chance to continue the debate, Alderman Vander Leest blocked me from participating in his Facebook page with no explanation or warning whatsoever - a ban that continued well into 2020. This prevented me from posting, commenting and "liking" his posts, and also prevented me from seeing his content in my regular news feed.

I strongly believe this act prevented me from exercising my First Amendment rights to participate in the exchange of ideas in this public forum, and also my right to petition my elected official on matters that affected me as a taxpayer in the City of Green Bay. While there are certainly other ways for one to contact their alderperson, the fact that Mr. Vander Leest solicits input from constituents and excludes those who have views that differ from his own inaccurately paints a picture of support, slanted to his own political preference. This act of ill-will from one's own elected representative puts a chilling effect on speech and effectively closes the lines of communication. I have no trust that if I would make a phone call to Mr. Vander Leest about a simple issue like a pothole that he would even work on my behalf.

Mr. Vander Leest has said in the past, "I'm here to represent all the people of the district." In a March 2020 newspaper profile, he stated, "I listen to residents of my area and know what is important to them." I believe his actions clearly show he has no intention of "making the public feel welcome" or conveying to the public his "respect and appreciation for the public's participation, input, and opinions" as the city's own Code of Conduct for Elected Officials mandates. His conduct during his time in office demonstrates anything but fairness, openness and willingness to work for all he represents. I have no ill-will towards Mr. Vander Leest. On the contrary, I want nothing more than to have a fruitful relationship with my public officials and have the ability to have my viewpoints not only heard but genuinely considered. This has nothing to do with an election and I'm not looking to run him out of office. But I do expect more of my elected officials and I wish for him to take responsibility in this matter and commit to respecting all his constituents' Constitutional rights.

- Mark Zahn, 4/23/20

HOW TO TELL IF YOU HAVE BEEN BLOCKED ON FACEBOOK

On the page, no "like" button will be present to follow the page, and no "like" or "comment" buttons will be available, cutting off all interaction with the page

Facebook offers a "Town Hall" feature that shows you your elected officials based on your street address. You then have the ability to follow those officials' pages and get their mailing address, email and phone #.

When blocked by Alderman Vander Leest (shown at left), no option to follow the page exists, preventing you from getting new content from the alderman in your news feed, and barring you from interacting with the conversation that happens there.

Statements about deletion of comments/posts and about having been blocked, made by (clockwise) Beth Lane, Jon Schultz, Wendy Coriell, Jennifer Jacobson Carew, and Abbey Vizelka, respectively, 23 April 2020.

Diagram showing the difference between available features while having been blocked by the "Green Bay City Council - John S. Vander Leest" social media account and while not having been blocked, 23 April 2020.

My commission is permanent

Before the City of Green Bay
Ethics Board

Tarl Knight, Complainant

vs.

John S. Vanderleest, City Council Member, Respondent

The respondent, by his counsel, Robert J. Miller moves for a dismissal of the charges based upon the following individual bases :

1. The charges regarding the social media section of the Ethics Code should be dismissed because there is no applicable cases barring the respondent from deleting or restricting access to his website. He has complied with all applicable requirements. Further, the Ethics code does not appear to cover the use of social media.

2. The charge regarding violation of the public meeting section (section 4 of the Code of Ethics should be dismissed because the operation of a website or facebook page is not a public meeting. "Public meeting" has clear definitions in routine parlance, in legal terms, and in the the Wisconsin statutes.

Moreover, the Ethics Board by applying the public meeting standard would essentially be re-writing the ordinance well beyond the plain meaning of its terms. The Ethics board has not been delegated the power to enact new ethics rules.

3. Section 230 of the Communication Decency (previously cited in documents) preempts any action by state and local government against the sponsor/manager of a web site. The actions of policing a website's content fall within this area. The action should be dismissed on this basis.

4. Vanderleest arguably followed the current advice of the Wisconsin Ethics Board. This board ostensibly grants Wisconsin officials the right to manage facebook posts. He should not be be punished while in compliance with the guidance of the Wisconsin Ethics Board.

5. Vanderleest and his colleagues were given no instruction on the use of social media. The Ethics Board moves to impose guidelines retroactively and recast ethics guidelines (public meeting definitions) after the fact. This is a separate basis for dismissal.

6. The City of Green Bay Personnel Policy cited in the complaint would not be applicable to an Alderman. In any event, the policy outlines that each City of Green Bay site is solely owned by the City. The section requiring compliance with all applicable social media rules (24.3) has no applicability to a personal/campaign website produced by a city council member.

7. The legislative action creating the Ethics Board neither adopted nor promulgated procedural and evidentiary rules for its proceedings. Therefore, the proceedings have no constitutional validity and are violative of basic due process (Wisconsin and U.S. Constitutions).

8. The application of these rules in the midst of a political campaign creates one set of rules for the incumbent and another for the challenger. The action should be dismissed because of its violation of the constitutional requirements for equal protection of the laws (Wisconsin and U.S. Constitutions).

TARL KNIGHT
Complainant

vs.

JOHN S. VANDERLEEST
Respondent

MOTION TO SUPPRESS

I, the Complainant, am requesting a motion to strike the affidavit signed by Green Bay Area School Board member Rhonda Sitnikau and submitted by the Respondent 13 September 2020. Ms. Sitnikau has not been listed as a potential witness by the Respondent, nor as an aggrieved party by the Complainant. Although I am familiar with Ms. Sitnikau and am particularly sensitive to Ms. Sitnikau's situation, its relevance to the material at issue is unclear and completely unrelated to the original formal complaint and its claims against the Respondent.

Further, I have since corresponded with Ms. Sitnikau, who was clearly unfamiliar with the case and how the Respondent plans to connect the affidavit to the material at issue.

Thank you,

Tarl Knight

Before the Ethics Board of Green Bay

Tarl Knight, Complainant

vs.

John S. Vanderleest, Respondent

BRIEF SUPPORTING MOTIONS TO DISMISS

I. The charge regarding violation of the public meeting (section 4 of the code of ethics) should be dismissed because the operation of a website or Facebook page is not a "public meeting" in the context of the Code of Ethics. It has a clear definition in routine parlance, in legal terms, in the Wisconsin statutes, and in the city of Green Bay ordinances

A. We have a specific definition of public meeting in Wisconsin via the open meetings law: It is the convening of members of a governmental body for the purpose of exercising responsibilities authority power or duties delegated to or vested in the body. Section 19.82 (2) Wisconsin Statutes.

The caselaw further illuminates the statute by stating that a meeting contemplates at least two members per the statute, *Plourde vs. Horner*, et.al, Court of Appeals, 2006 WI App 147 at paragraph 14:

In other words, we require the public to be granted access to discussions among governmental body members so that the public can be informed of the debate and decision-making process that occurs between the body's membership. But it would be absurd, if not impossible, to require an open meeting notice whenever a body of one would set out to contemplate a pending issue. We do not believe the legislature intended to require public soliloquies by single-member governmental bodies.

If the term "public meeting" is not limited to its definition and clear meaning, then what limits a complainant from including anything as a "public meeting?" A chance meeting on the street, or in a store, or at a place of worship suddenly becomes a public meeting where the official is subject to the rules of the ethics code. At that point, what portion of a public official's life is not subject to the code?

B. The plain meaning of "public meeting" does not include Facebook exchanges.

Wisconsin courts have held that the statutory interpretation "begins with the language of the statute. If the language is plain we ordinarily stop the

inquiry," **Bruno vs. Milwaukee County** 2003 WI 28 at paragraph 8.

There is no ambiguity in the common understanding of public meetings. We have definitions in the Wisconsin statutes and in Green Bay's ordinances.

Importantly, the understanding of a statute or ordinance does not involve a search for ambiguity where there is none: "This is not to say that interpretation will always be straightforward and easy --just that we should not make it gratuitously roundabout and complex," Antonin Scalia and Bryan Garner, **Reading Law: The Interpretation of Legal Texts** (2012) at p. 70.

C. *The rule of lenity in the interpretation of ordinances/statutes works against the expansion of the meaning of "public meeting to include facebook exchanges.*

The rule of lenity has been defined as follow: "Ambiguity in a statute defining a crime or imposing a penalty should be resolve in the defendant's favor," Antonin Scalia and Bryan Garner, **Reading Law: The Interpretation of Legal Texts** (2012) at p. 296.

The rationale for this rule is that it is the legislature, not the judiciary that shall impose the penalty:

The rule that penal laws are to be construed strictly is founded on the tenderness of the law for the rights of individuals and on the plain principle that the power of punishment is vested in the legislative not the judicial department. It is the legislature not the court which is to find a crime and ordain it's punishment, **United States vs. Wiltberger**, 18 U.S. (5 Wheat) 76 at p. 95 (1820)

This rationale argues for the standard meaning of "public meeting." A punitive ordinance, once drafted, does not grow to encapsulate new conduct. Rather, it is strictly construed per its meaning to protect the rights of the defendant.

As the Supreme Court stated in **United State vs. CIO**, 335 U.S. 106 at 142 (1948) ,when the state seeks to punish, it must do so with a clarion prior warning and clarity:

The conduct proscribed must be defined specifically so that the person or persons affected remain secure and unrestrained in the rights to engage in activities not encompassed by the legislation. Blurred signposts to criminality will not suffice to create it.

In this instance, the council members have been not offered training in appropriate internet conduct (see affidavit of Council Member Chris Wery). The Council is considering mandatory internet social media training months after Vanderleest has been charged with an ethics violation (see communication of Alderperson Dorff, appended). It is as if the city withholds guidance on social media use until a council member is ensnared by a potential ethical trap.

D. *The action of the City of Green Bay via a constituent body (the Ethics Board) declaring that internet and facebook exchanges are "public meetings" will subject the city to thousands of open meetings law violations.*

If the city now believes its internet and facebook exchanges are "public meetings." There are presumably thousands of open meetings violations as the city failed to properly notice those meetings.

The potential financial ramification of this transmutation of "public meeting" could be enormous.

II. The Ethics board is not empowered to legislate by re-writing city ordinances.

The complaint references a city personnel policy on the subject of social media, etc. If the Council wished to expand that policy to the City Council it would have been a very easy step to do so. It chose not to include social media conduct.

The legislative power of the City of Green Bay is vested in its City Council. It is not vested in an unelected regulatory board—the Ethics Board. The City Council did not delegate to the Ethics Board the right to legislate. The arrogation of this power by the Board to itself is, at a minimum, objectionable.

It is situation directly out of Alice in Wonderland for the Ethics Board to re-write, re-cast, and transmute an ordinance, and then find a member in violation of the newly-minted ordinance and/or interpretation.

III. Section e3 of the Communications Decency Act pre-empts any state or local action which is contrary to the act. The act is appended.

The relevant section is this:

3)State law

Nothing in this section shall be construed to prevent any State from enforcing any State law that is consistent with this section. No cause of action may be brought and no liability may be imposed under any State or local law that is inconsistent with this section.

The act of evading the statute's mandates is not achieved by calling objectionable conduct by another name. Punishing people for responsible policing of internet sites is banned by the act.

IV. There is no violation of any controlling rule of law

The action of policing website or facebook content does not violate any case which is controlling precedent in the Eastern District of Wisconsin.

Ironically, real public meetings have the restriction of content and access that the complainant condemns when exhibited on the internet. Section 2.06 (11) of the city's ordinances provides as follows:

Rights of others to address the council: No person other than a member of the council shall address the council unless the rules are suspended, except under the order of business for that purpose.

A member of the public does not have a blanket right to address the council or its committees. His time may be limited or eliminated entirely. This is not viewed as violation of the ethics code.

Moreover, the public does not have a constitutional right to have a public official listen to them, *Morgan vs. Bevin*, 298 F. Supp 3d 1003 (E.D. Ky. 2018) at 1011.

There is "no constitutional right as members of the public to a government audience for their policy views." *Minn. State Bd. for Cmty. Colleges v. Knight*, 465 U.S. 271, 286 (1984). Governor Bevin is under no obligation to listen to Plaintiffs, and Plaintiffs have no Constitutional right to be heard in this precise manner. "Nothing in the First Amendment or in this Court's case law interpreting it suggests that the rights to speak, associate, and petition require government policymakers to listen or respond to individuals' communications on public issues." *Id.* at 285. Governor Bevin has chosen to effectively, "ignore" those on Facebook he deems are not following the line of conversations he has decided to start on Facebook. *Smith v. Ark. State Highway Emp., Local 1315*, 441 U.S. 463, 466 (1979) (holding, in part, "the First Amendment does not impose any affirmative obligation on the government to listen [or] to respond.") Governor Bevin's Twitter and Facebook accounts

It would be farfetched to sanction a public official for refusing to take a phone call, failing to open and read a letter, or refusing to meet with a member of the public. However, that is the direction that this enforcement action leads.

Quite the opposite is true regarding policing an internet/ facebook site. The Wisconsin Ethics Board appears to approve of state officials managing facebook pages. In addition, the court in *Morgan vs. Bevin* approved conduct similar to that of Mr. Vanderleest.

V. Complainants motion to suppress has no application to this proceeding.

A motion to suppress is classically filed to suppress evidence in a criminal proceeding where the government has violated the defendant's rights.

It underlines the lack of rules in this proceeding. There appear to be virtually no procedural or evidentiary rules. At the very least, there are no written rules that were given to the litigants at the outset of this proceeding.

If Mr. Knight seeks to police and edit the evidence that the Ethics board hears, then it is manifest that the same control needs to be present in the management of website and facebook content.

VI. Conclusion

A public official should not have to engage in a scavenger hunt to determine the applicable ethical guidelines and when they apply. The official, when subject to an ethics proceeding, should not have to guess at the procedural rules and evidentiary standards.

Both situations are present in this proceeding. No one would reasonably believe that the operation of a facebook site is a "public meeting" accordingly to the terms of the ethics code

To change the meaning of terms after the fact and conclude that conduct is objectionable is as lawless as it is astonishing.

Brown County has already dismissed a complaint by Mr. Knight. The City of Green Bay should do likewise.

Respectfully submitted by:

s/ R. Miller

Attorney R. J. Miller
Attorney for Council Member John Vanderleests

7 U.S. Code § 230 - Protection for private blocking and screening of offensive material

U.S. Code

(a) Findings—The Congress finds the following:

(1) The rapidly developing array of Internet and other interactive computer services available to individual Americans represent an extraordinary advance in the availability of educational and informational resources to our citizens.

(2) These services offer users a great degree of control over the information that they receive, as well as the potential for even greater control in the future as technology develops.

(3) The Internet and other interactive computer services offer a forum for a true diversity of political discourse, unique opportunities for cultural development, and myriad avenues for intellectual activity.

(4) The Internet and other interactive computer services have flourished, to the benefit of all Americans, with a minimum of government regulation.

(5) Increasingly Americans are relying on interactive media for a variety of political, educational, cultural, and entertainment services.

(b) Policy—It is the policy of the United States—

(1) to promote the continued development of the Internet and other interactive computer services and other interactive media;

(2) to preserve the vibrant and competitive free market that presently exists for the Internet and other interactive computer services, unfettered by Federal or State regulation;

(3) to encourage the development of technologies which maximize user control over what information is received by individuals, families, and schools who use the Internet and other interactive computer services;

(4) to remove disincentives for the development and utilization of blocking and filtering technologies that empower parents to restrict their children's access to objectionable or inappropriate online material; and

(5) to ensure vigorous enforcement of Federal criminal laws to deter and punish trafficking in obscenity, stalking, and harassment by means of computer.

(c) Protection for "Good Samaritan" blocking and screening of offensive material

(1) Treatment of publisher or speaker

No provider or user of an interactive computer service shall be treated as the publisher or speaker of any information provided by another information content provider.

(2) Civil liability No provider or user of an interactive computer service shall be held liable on account of—

(A) any action voluntarily taken in good faith to restrict access to or availability of material that the provider or user considers to be obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable, whether or not such material is constitutionally protected; or

(B) any action taken to enable or make available to information content providers or others the technical means to restrict access to material described in paragraph (1). [1]

(d) Obligations of interactive computer service

A provider of interactive computer service shall, at the time of entering an agreement with a customer for the provision of interactive computer service and in a manner deemed appropriate by the provider, notify such customer that parental-control protections (such as computer hardware, software, or filtering services) are commercially available that may assist the customer in limiting access to material that is harmful to minors. Such notice shall identify, or provide the customer with access to information identifying, current providers of such protections.

(e) Effect on other laws

(1) No effect on criminal law

Nothing in this section shall be construed to impair the enforcement of section 223 or 231 of this title, chapter 71 (relating to obscenity) or 110 (relating to sexual exploitation of children) of title 18, or any other Federal criminal statute.

(2) No effect on intellectual property law

Nothing in this section shall be construed to limit or expand any law pertaining to intellectual property.

(3) State law

Nothing in this section shall be construed to prevent any State from enforcing any State law that is consistent with this section. No cause of action may be brought and no liability may be imposed under any State or local law that is inconsistent with this section.

(4) No effect on communications privacy law

Nothing in this section shall be construed to limit the application of the Electronic Communications Privacy Act of 1986 or any of the amendments made by such Act, or any similar State law.

(5)No effect on sex trafficking lawNothing in this section (other than subsection (c)(2)(A)) shall be construed to impair or limit—

(A)any claim in a civil action brought under section 1595 of title 18, if the conduct underlying the claim constitutes a violation of section 1591 of that title;

(B)any charge in a criminal prosecution brought under State law if the conduct underlying the charge would constitute a violation of section 1591 of title 18; or

(C)any charge in a criminal prosecution brought under State law if the conduct underlying the charge would constitute a violation of section 2421A of title 18, and promotion or facilitation of prostitution is illegal in the jurisdiction where the defendant's promotion or facilitation of prostitution was targeted.

(f)DefinitionsAs used in this section:

(1)Internet

The term "Internet" means the international computer network of both Federal and non-Federal interoperable packet switched data networks.

(2)Interactive computer service

The term "interactive computer service" means any information service, system, or access software provider that provides or enables computer access by multiple users to a computer server, including specifically a service or system that provides access to the Internet and such systems operated or services offered by libraries or educational institutions.

(3)Information content provider

The term "information content provider" means any person or entity that is responsible, in whole or in part, for the creation or development of information provided through the Internet or any other interactive computer service.

(4)Access software providerThe term "access software provider" means a provider of software (including client or server software), or enabling tools that do any one or more of the following:

(A)filter, screen, allow, or disallow content;

(B)pick, choose, analyze, or digest content; or

(C)transmit, receive, display, forward, cache, search, subset, organize, reorganize, or translate content.

(June 19, 1934, ch. 652, title II, § 230, as added Pub. L. 104–104, title V, § 509, Feb. 8, 1996, 110 Stat. 137; amended Pub. L. 105–277, div. C, title XIV, § 1404(a), Oct. 21, 1998, 112 Stat. 2681–739; Pub. L. 115–164, § 4(a), Apr. 11, 2018, 132 Stat. 1254.)

U.S. Code Toolbox

Late Communication 9-15-2020

To the mayor's office:

Due to concerns from citizens regarding recent social media comments made and actions taken, by city elected officials, and my belief that members of city council may not be well informed as to current best practice regarding social media, I am requesting a mandatory training for all alders and other elected officials, possibly held during a city council meeting, clearly delineating what is and is not appropriate use of social media by an elected official.

Alder Dorff District 1

Council Meeting 9-15-20

TARL KNIGHT
Complainant

vs.

JOHN S. VANDERLEEST
Respondent

MOTION TO SUPPRESS

I, the Complainant, am requesting a motion to strike the Respondent's motion to dismiss, signed and filed 18 September 2020. The Respondent's motion is not pertinent to the sections of the City of Green Bay's own Code of Conduct which were cited by the original formal complaint. Its sections regarding the City of Green Bay's Personnel Policy, social media instruction for public officials, and the remainder of its content are still not pertinent to the City of Green Bay's Code of Conduct which was cited by the original formal complaint.

Thank you,

Tarl Knight

Report to the
Sustainability Commission
of the City of Green Bay

MEETING DATE

December 1, 2020

PREPARED BY

AGENDA ITEM # V.I

To hold the report of the Green Infrastructure Code Audit to the December 16, 2020 meeting.

BACKGROUND

Green Infrastructure code audit is currently being reviewed by internal City departments. Next steps will be going to Committee / Commission review.

RECOMMENDATION

Recommend the proposed GI code amendments go to committees/commissions in December.

FISCAL IMPACT

ATTACHMENTS

- I. GI Summary of Findings&Recommendations I I 09 2020

City of Green Bay, Wisconsin
Green Infrastructure Codes Project
Summary of Findings & Recommendations

Code Area	Key Codes and Standards	"Grade"	Opportunities	Recommended Actions or Draft Document	Final Draft
Stormwater	Chapter 30	B	Standard ordinance	*Add definitions of green infrastructure to 30.04 *State specifically that green infrastructure practices following WI DNR Storm Water Post Construction Technical Standards are accepted in 30.06(7) *Add integration with landscape plans to 30.08(1)	WISCONSIN_GREEN BAY_Chapter 30 Stormwater Management_markup
Erosion Control	Chapter 34 And Chapter 13, Division 11 (Zoning)	B-	Standard ordinance Section 34.08 includes "performance standards for construction sites not required to be permitted" but this is not enforced	*Add a standard to demarcate the limits of disturbance and the drip line of mature trees to remain on site prior to initiating construction under 30.09(2). <i>*Consider a small sites erosion control guide (future action)</i>	An excellent small sites erosion handbook: Vermont's "The Low Risk Site Handbook for Erosion Prevention and Sediment Control"
Definitions	Chapter 30 (Stormwater) Chapter 13 (Zoning)	B+	Green infrastructure definitions are not present in	*Add green infrastructure definitions to 30.04 *Under 13.303 Land Use Definitions, either refer to 30.04 or add the same definitions	Definitions are added in 30.04 and 13.303; see WISCONSIN_GREEN BAY_GI CODES_SEC 13 ZONING DEFINITIONS_11-9-2020.

City of Green Bay, Wisconsin
Green Infrastructure Codes Project
Summary of Findings & Recommendations

			Chapter 30 or Chapter 13		
Architectural Design Standards	Subchapter 13.500 General Regulations Subchapter 13.1400 Traditional Neighborhood Development	A-	No apparent conflicts with TND	*Add rain barrels, planter boxes & other rainwater harvesting as a permitted setback encroachments under 13.509	WISCONSIN_GREEN BAY_GI CODES_Permitted Setback Encroachments amendment_11-9- 2020
Landscaping	Chapter 13, Subchapter 13.1800, Division 5: Landscaping	D	Substantial barriers to the integration of vegetated stormwater management	*Significant revisions to Section 13.1800 are recommended	WISCONSIN_GREEN BAY_GI CODES_DIVISION 5 LANDSCAPING_draft 10-20-31 and clean draft versions
Parking	Chapter 13 (Zoning)	A+	Green Bay has updated its parking ratios and standards to reflect contemporary best practices.		n/a
Permeable Materials	Chapter 30 Section 13.1714 Surfacing	A-	Provisions for permeable pavement as a BMP are not explicitly included in Chapter 30 Not a barrier per se but	*Add sentence to 13.1714 to state that permeable pavement systems meeting WI DNR Technical Standards are acceptable to meet the purposes of the section.
